[15] Fuel expense includes ash handling.
[16] Burn coke breeze.
[17] 50 per cent of consumption in district served supplied by water power requiring 100 per cent steam reserve in readiness all the time; burns low-grade, high-ash, small-size anthracite.
[18] Energy consumed for excitation not included.
* Kva. † Engine-driven direct-current generator. ‡ Compound Corliss. ‖ Mixed-pressure turbine. § Hp. ¶ Reciprocating engine. ** Standby plant. †† One 1,000-kva. unit being removed and one 5,000-kva. unit installed. ‡‡ Installed 11/15/21. ‖‖ Corliss engines. §§ Engine driven sets.

its output larger, and to the further fact that the fuel expense is low owing to the proximity of the plant to a mine. Furthermore, the maintenance expense is minimized by operating the plant below rating.

If the fixed charges on some of these plants could be uniformly and accurately ascertained, the unit over-all costs might rank in a totally different order. It remains for some one to study the combined fixed and operating costs to ascertain how much money a company can afford to spend for refinements in equipment. Here again, however, it is necessary to determine whether an increase in operating expense is not justified by the greater reliability of service which may be assured.

Aside from plant No. 57, the station operating at the lowest unit cost (exclusive of fixed charges) is No. 53. This plant is producing a kilowatt-hour at 0.470 cent, but it has a 60,000-kw. unit and is operating at 58.2 per cent plant factor. As may be seen, its maintenance expense during the period covered had not yet reached large proportions.

Among the larger stations, No. 64 has the highest production expense—namely 0.894 cent per kilowatt-hour—because of the combination of low plant factor, high coal charge, high wages and high boiler-plant maintenance. Similar conditions obtain for station No. 12, and more particularly for No. 175. The expenses of the latter indicate what must be paid for standby service.

Of particular concern to companies interested in burning powdered coal are the operating economy and production expenses of station No. 184, which is rated at 40,000 kw. With coal containing 11,961 B.t.u. per pound and costing \$4.94 per short ton, this station is producing a kilowatt-hour on 19,200 B.t.u. The operating expense is only 0.469 cent per kilowatt-hour, and the total production expense is 0.510 cent per kilowatt-hour. Although these figures answer some of the principal questions which have been raised in engineers' minds, it would be interesting to know what the fixed charges on stations of this character are.

To enable readers to interpret the figures, the accompanying table was sent to each company submitting data with the request that explanations be given for results where they differ very much from the average for the group. Some of the comments are incorporated in the table as footnotes. Others, arranged in the same order as that in which the companies are listed (i.e., according to rating), are digested below:

No. 115.—From Sept. 1, 1922, to April 1, 1923, the production expenses considerably improved. They are:

| | Cents per Kw.-Hr. |
|---|---|
| Average fuel cost | 0.460 |
| Average labor cost | 0.127 |
| Average water, lubrication and supplies cost | 0.014 |
| Total operating expense | 0.601 |
| Total maintenance expense | 0.095 |
| Grand total | 0.697 |
| Average pounds of fuel per kw.-hr. | 1.932 |

During this period (on Aug. 16, 1922) a 20,000-kw. turbine was put in operation. The labor expense is above the average, largely owing to the fact that the plant is rambling; i.e., it covers considerable territory and has several floor levels. In order to safeguard against failure of one of the large machines it is necessary to have enough help to put one of the smaller units in service in an emergency.

No. 84.—"In comparing our station with others covered by this report, one point comes to my attention which I think would be well to incorporate in your form, that is, the number of B.t.u. for 1 cent. With the above figure it would be very easy to compare the relative operating conditions of the different plants and would permit a much more rapid comparison of the production costs of the various stations, instead of trying to compare the cost of coal and B.t.u. per pound."

No. 12.—Coal price is higher than others of group and plant factor is lower.

No. 186.—"Since putting two new 1,500-hp. boilers in service, our B.t.u. per kilowatt-hour for the past three months has averaged 19,723."

No. 184.—The third unit of this plant was placed in service in October, 1922. Since July 1, 1922, the fuel economy has improved somewhat, although the plant factor is slightly less. Figures follow:

| | |
|---|---|
| Installed generator rating of station, kw. | 70,000 |
| Station output in kw.-hr. for year ended Dec. 31, 1922 | 253,046,466 |
| Peak load for same period | 58,000 |
| Annual plant factor (net output in kw.-hr. divided by 8,760 times installed kw.), per cent | 41.27 |
| Fuel (coal or oil) consumption for same period, lb. | 391,953,556 |
| Average B.t.u. per lb. | 12,056 |
| Coal, lb. per switchboard kw.-hr. | 1.55 |
| B.t.u. per switchboard kw.-hr. | 18,674 |
| Average price of fuel delivered per short ton | \$5.47 |
| Operating expenses, cents per kw.-hr. delivered from switchboard: | |
| (a) Fuel | 0.4234 |
| (b) Wages and superintendence | 0.0594 |
| (c) Water, lubricants, supplies, etc. | 0.0058 |
| Maintenance expense, cents per kw.-hr. delivered from switchboard: | |
| (a) Station buildings and structures | 0.0015 |
| (b) Boiler plant | 0.0199 |
| (c) Prime movers and auxiliaries | 0.0036 |
| (d) Generators and other electrical equipment | 0.0024 |
| (e) Miscellaneous equipment | 0.0121 |
| Number, type and rating of boilers | Eight 1,306-hp. Edge Moor |
| Number, type and rating of prime movers (turbines): | Two 20,000-kw. G. E. horizontal<br>One 30,000-kw. G. E. horizontal |

No. 57.—"The pounds of coal per kilowatt-hour for our plant is probably below the average. This is due mostly to the fact that the equipment was run during this period at its most economical loading. The grand total cost is also possibly below the average, due to the fact that the mine from which the power-plant coal is obtained is immediately adjacent to the plant. Consequently we have no freight to pay on coal."

No. 234.—"Our maintenance expenses are only divided between boiler department and generating department. These divisions are as follows:

| | Cents per Kw.-Hr. |
|---|---|
| Total generator-room maintenance | \$0.0466 |
| Total boiler-room maintenance | 0.0384 |
| Total | \$0.08508 |

"This gives a total operation and maintenance expense of 0.92308 cent per kilowatt-hour."

No. 85.—"Since July 1, 1922, we have made a great many changes in this plant, which was in very poor condition in the year 1921, and have raised its economy very materially. The coal rate has been reduced from 2.30 lb. per kilowatt-hour to 1.77 lb., reducing the B.t.u. from 33,350 to 25,665 per kilowatt-hour. Figures for the first three months in 1923 follow:

| | |
|---|---|
| Installed generator rating, kw. | 33,000 |
| Annual plant factor, per cent | 37.7 |
| Annual output, kw.-hr. | 26,925,400 |
| Peak load, kw. | 23,500 |
| Fuel consumption, short tons | 23,919 |
| Average B.t.u. per lb. | 14,500 |
| Average ash, per cent | 6.8 |
| Price of fuel delivered | \$6.80 |
| Lb. fuel per kw.-hr. | 1.77 |
| B.t.u. per kw.-hr. | 25,665 |
| Operating expenses (cents per kw.-hr. delivered): | |
| Fuel | \$0.612 |
| Wages and superintendence | 0.093 |
| Water, lubrication and supplies | 0.008 |
| Total | 0.714 |
| Maintenance: | |
| Building and structures | 0.003 |
| Boiler plant | 0.022 |
| Prime movers and auxiliaries | 0.007 |
| Generator and electrical equipment | 0.025 |
| Miscellaneous | 0.00003 |
| Total | 0.058 |
| Grand total | 0.773 |
| Rating of boilers (sixteen), each, hp. | 512 |
| Rating of generators: | |
| Three, each, kw. | 10,000 |
| One, kw. | 3,000 |

No. 208.—"The large coal consumption per kilowatt-hour for the period covered by this questionnaire was due to the fact that on account of an accident to our 5,000-kw. unit we were forced to operate the older equipment for several months. At present our coal consumption is about 2.5 lb. per net kilowatt-hour, using coal with a heating value of approximately 12,250 B.t.u. per pound."

No. 11.—Low cost of coal is due to station being contiguous to mines.

No. 49.—Since July 1, 1922, the following results have been obtained:

| | |
|---|---|
| Annual plant factor, per cent | 41.0 |
| Average ash, per cent | 9.07 |
| Lb. fuel per kw.-hr. | 2.57 |
| B.t.u. per kw.-hr. | 34,695 |

# Straight Lines as Rate Curves

## A New Method for Making Rate Studies by Using Graphical Charts—Hyperbolic Curves Reduced to Straight Lines Without Making Calculations—Greater Accuracy and Convenience Secured

By H. E. EISENMENGER
*New York Edison Company*

IF RATE schedules are to be graphically expressed by curves, the almost universally chosen method is to plot the cents per kilowatt-hour on a vertical scale over the kilowatt-hours consumed. This results in curved lines. Just as some other curves can be turned into straight lines by using a logarithmic scale so these curves can be straightened if the kilowatt-hours are plotted on a "reciprocal" or "hyperbolic" scale. The design of this kind of scale, which is a very simple matter, is explained in the article. A scale of this kind, once constructed, can be reproduced by blueprinting, photostating, etc., and used for all subsequent work with rate curves just as the ready-made logarithmic scales are used for other investigations.

The use of the hyperbolic scale not only results in a great simplification, with a consequent saving of time and work, but it has also several other advantages which are fully explained in the article. Its principal application is in the study of rates and in the design of new rates.

In the latter part of the article other methods of rate representation and of rate comparison are discussed which make use of straight lines only.

GRAPHICAL representation of central-station rates for the purpose of comparing different rates, for designing new rates, etc., is, as a rule, carried out by plotting the average charge in cents per kilowatt-hour against the number of kilowatt-hours. This will generally not result in straight lines, except in case of the first block of a block rate or in case of a step rate. In practically all other cases curved lines result, notably for the various kinds of block rates. Even in case of step rates, curved lines join the straight lines to one another where the stipulation is made that the application of the lower step shall not make the bill for a larger consumer less than for a smaller consumer or *vice versa.* In other words, where there is an unchanged bill over a certain range of kilowatt-hours, also where the cents per kilowatt-hour are plotted as a function of the load factor, curved lines as a rule result.

The construction of these curved lines is a tedious work and must be preceded by the calculation of a table giving the values for a sufficient number of points of the curve. Even with the use of a calculating machine or where a slide rule is accurate enough, this work takes up much time. The accuracy of the curve is rather limited because a curved line can be made to follow points which are slightly wrong and does not show the consequent distortion from its true shape as readily as a straight line will.

For these and other reasons it is desirable to replace these curves by straight lines through the use of an appropriate scale. Double logarithmic scales will accomplish this, but they require a shifting of the scale for every block, which makes them worthless for this particular purpose.

I have shown in my book on "Central Station Rates"* (pages 360-365) that the curves in question are equilateral hyperbolas, the vertical asymptotes of which are identical with the axis of ordinates—that is, with the axis of cents per kilowatt-hour—whereas the horizontal asymptote is raised over the horizontal axis, or axis of kilowatt-hours, by an amount which is equal to the cents per kilowatt-hour charged in the respective block for the incremental kilowatt-hour. In case of constant bills (intermediate stages in step rates, also minimum bills) the horizontal asymptote is identical with the horizontal axis.

These fundamental facts bring the thought near that it must be possible to stretch these curves into straight lines if we step off the horizontal distances (kilowatt-hours) on a hyperbolical scale, so that the change of the horizontal distances which corresponds to a constant vertical distance in the original curve is offset by an equal but opposite change of the length of the unit on the horizontal scale. The exact proof that the curves must actually become straight lines is easy with the material on hand in the theoretical part of the book mentioned above, but no space shall be taken up with this point in the present article, which is concerned with the practical side of the question only.

### How to Construct the Scale

The scale is constructed in the following manner: Take a convenient horizontal length *MN* (bottom of Fig. 1) as unit; for instance, 100 divisions of a cross-section paper. Step off from the right-hand side *N* toward the left one-tenth of this length and call the point thus received 10. Then step off from *N* to the left a length equal to one-ninth and call the point 9; the point at a distance of one-eighth to the left of *N* will be called 8, and so on until the point 1 is reached, which is at *M*. Fractional values are determined in the same way; for example, the point at the distance 1/1.5 to the left of *N* is called 1.5, etc. In this manner as many points of the scale as seems desirable are determined. On account of the small size of the illustrations fewer of these points are shown in Fig. 1 than will be used for purposes of practice. One could, of course, also continue to the left of the point *M* and enter the points 0.9, 0.8, etc., but this will seldom result in any advantage. The range from 0.5 to 1 in this manner would take up more space than the entire range from 1 to 10. The point *N* represents infinity and the vertical line drawn through this point (dash-and-dot line) will be called the "infinity line." The vertical scale is an ordinary arithmetical cents-per-kilowatt-hour scale.

The use of the sheets ruled in the manner just

*"Central Station Rates in Theory and Practice," by H. E. Eisenmenger, Fred J. Drake & Company, Chicago, 1921.

described is best explained by an example. Suppose we have a block rate of 10 cents per kilowatt-hour for the first 10 kw.-hr. and 5 cents per kilowatt-hour for each kilowatt-hour after the first ten.

Each unit of the horizontal scale is assumed to represent 10 kw.-hr., so that the figures at the bottom of the sheet are to be multiplied by ten in order to give the number of kilowatt-hours and the point $M$ denotes 10 kw.-hr. There is now one point of the curve obviously at the height 10 cents per kilowatt-hour above $M$; this gives the point $A_1$ in Fig. 1. All there is to do now to draw the curve is to step off 5 cents per kilowatt-hour (that is, the charge in the second block) on the infinity line upward from $N$, which gives the point $B_1$, and then to join $A_1$ and $B_1$. (For $\infty$ kw.-hr. the average charge per kilowatt-hour is 5 cents). This

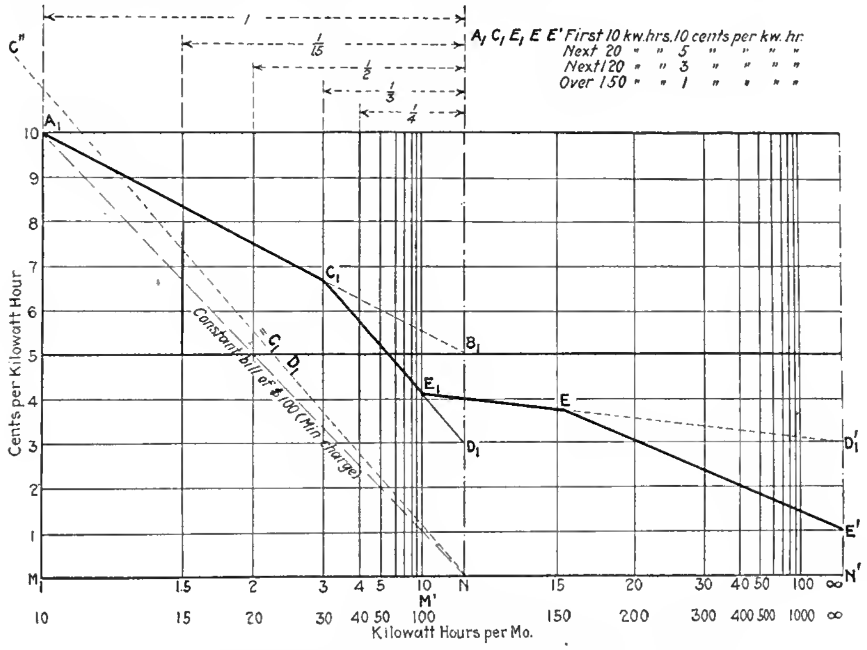

FIG. 1—CONVERTING BLOCK RATES TO STRAIGHT LINES

will immediately give the desired curve without any figuring.

Suppose now there is a third block commencing at 30 kw.-hr. and that all kilowatt-hours in this block are charged at 3 cents per kilowatt-hour; then one takes the intersection point $C_1$ of the rate curve $A_1B_1$ with the vertical which is laid through the point 3 (30 kw.-hr.) and joins it to the point $D_1$, which is found at the height 3 cents per kilowatt-hour on the infinity line.

Now, it will be observed that in the higher ranges of kilowatt-hours—say, above 100 kw.-hr.—the horizontal scale becomes very much compressed. If desired, this portion of the horizontal scale can easily be expanded in the following manner:

Draw a scale $M'N'$, which is identical with $MN$, but use figures ten times as large, placing $M'$ on the point 10 of the original horizontal scale. In this way another infinity line is obtained starting upward from the point $N'$. The old infinity line is then, as can be easily seen, located at the point $1/0.9 = 1.111$ of the new scale. Take now the intersection $E_1$ of the rate line with the vertical line drawn through the point 10 and connect it to the point $D_1$, which is situated at the distance 3 cents per kilowatt-hour above $N'$ on the second infinity line. This gives the equivalent of the portion $E_1D_1$ of the rate line over the expanded scale $M'N'$. The original and the added portion of the diagram shall be called "sections."

Just to carry the example further, assume now a fourth block beginning at 150 kw.-hr., all kilowatt-hours in this block to be charged at 1 cent. $EE'$ gives then the rate curve in this block.

One is, of course, not restricted to making the change of the scale at the point 10. It may be made at any other point that seems desirable, but as a rule this will be the most convenient point in practice. One can also, of course, add a third section to the right of $N$ representing 100-1,000 units; that is, in the case under consideration, 1,000-10,000 kw.-hr.

It is possible also (according to a suggestion by William B. Jackson) to run each section to the infinity line and start the next section a short distance, say one-half inch, to the right of the infinity line, so that each section is entirely separated from the other and no overlapping of scales occurs. With the former method the space between 10 and $N$ has two scales because the point $N$ represents infinity on the first section and 11.111 on the second. The gap between the line representing 10 in the first section and the line representing 10 in the second section must then be bridged by horizontal lines; in other words, the points on the line representing 10 on the section to the left must be projected horizontally to the beginning of the new section.

The line representing a minimum charge is constructed in an equally simple way with the use of a hyperbolic scale. For example, if there is a minimum charge of $1, the curve representing this charge is found in the following way: One dollar means at a consumption of, say, 10 kw.-hr., an average charge of 10 cents per kilowatt-hour, and point $A_1$ is therefore one point of the line. The bottom point of the infinity line $N$ must be of necessity another point of that line, because at infinity kilowatt-hours and a constant bill of $1 the average charge is zero. $A_1N$ is therefore the line representing a minimum charge $1.

The same applies for every constant charge such as are frequently found between the steps of step rates. Take, for example, a step rate as follows: If the consumption is 150 kw.-hr. or less, 8 cents is charged for every kilowatt-hour; if the consumption is more than 150 kw.-hr., 6 cents is charged for every kilowatt-hour. No bill for a larger consumption is, however, to be smaller than that for a smaller consumption. There results then (Fig. 2) a straight horizontal line at the height of 8 cents per kilowatt-hour until it hits the 150-kw.-hr. line. From there the straight line drops toward the point $N$ until it reaches the 6-cents-per-kilowatt-hour line (which, as the figure shows directly and without any computation whatsoever, takes place at 200 kw.-hr.), and from there on the rate curve proceeds as a straight horizontal line. The inclined straight-rate line also indicates, without figuring, how large that constant bill is. The line, produced, intersects the 1,000-kw.-hr. line at 1.2 cents per kilowatt-hour (or the 100-kw.-hr. line at 12 cents per kilowatt-hour), and therefore the bill is 1,200 cents or $12.

It will be noted that in each case the entire rate curve has been drawn without a single calculation, which compares favorably with the long tables that have to be tediously figured out to obtain a curve of similar accuracy under the old system with an arithmetical horizontal scale. The plotting of a large number of points from the table becomes also unnecessary with the new system.

A third advantage is that the loss of time connected with the tracing of curved lines is avoided.

If, therefore, the scale is once laid out, a very considerable saving of work and time is effected for all future rate curves. Printed sheets with rulings after a hyperbolic scale comparable to the well-known log or double-log sheets are not yet on the market as far as the author is aware. But an ordinary cross-section sheet of generous dimensions about 20 in. high and 10 in. wide for each section (to insure accuracy) can be easily ruled with a hyperbolic scale by any good draftsman in a short time and can then be cheaply and quickly reproduced in any quantity and any size by photographic methods as a photostat, blueprint or Van Dyke print. The method of reproduction preferred by the author is a Van Dyke negative direct-printed copy, from which positive contact prints are taken which may be blueprints or black or brown prints. The latter are preferable if it is intended to photostat the sheet after the rate curves have been entered, because blue lines will photostat poorly. It is advisable to rule three sections on this master sheet, every point of each section representing ten times as many kilowatt-hours as the corresponding point on the neighboring section to the left.

The advantages of saving time and work are not the only ones of this straight-line method.

Where two or more rates are compared by means of the curved-line method, the curvature distorts the impression to be conveyed by the curve. Supposing, for instance, as a simple case, that there are two rate curves, one running above the other at a constant vertical distance of 0.1 cent per kilowatt-hour, both curves will come very closely together in the range of the low kilowatt-hours where the curves are very steep, and this may go so far that the two curves finally even run together and cannot be distinguished from one another because their mutual distance is smaller than the thickness of the lines (Fig. 3). On the right-hand end of the curves, where the energy consumptions are high and the curves almost horizontal, the distance between the two curves is practically 0.1 cent per kilowatt-hour. The curves will therefore give the impression of converging toward the left, or even of crossing at some point near their left end, although their vertical distance from one another is constant and equal to 0.1 cent per kilowatt-hour. An experienced person may discount this apparent convergence, but where the vertical distance is only approximately constant he will not be able to tell without measurements where the curved lines are converging to the left and where they are converging to the right, or whether they are parallel. Measurements are uncertain in the steep parts of the curves. Straight lines have an unchanged slope, and it is seen at a glance with a great degree of accuracy whether the lines are converging to the right or to the left, or whether they are parallel. Similar considerations apply, for instance, where one curve is by a constant percentage (discount) higher or lower than the other.

At the end of each block the rate curve, whether under the old or the new system of representation, must show a characteristic break, a sudden change downward of its slope. If the change in the kilowatt-hour charge at the end of a certain block is not great, the angle caused thereby in the curved line may be so small that it is overlooked when tracing the curve, and the curve is thus wrongly smoothed out. This introduces a further element of uncertainty and inaccuracy into the curve and obliterates the expression of the law of the curve, as becomes particularly evident where there are two or more rate curves which run very close to each other. They may then, although plotted with great care, alternately converge and diverge in an apparently unjustified and confusing way, without pronounced breaks, which gives them an erratic, slovenly appearance and gives rise in the spectator to suspicions as to their accuracy. With a straight-line system the changes of slope at the end of each block are not only clear-cut and more pronounced, but they cannot possibly be overlooked when constructing the curve. This makes it much more easy for the eye to grasp the law which the various rates curves follow, even though the changes in slope be small and the curves close together.

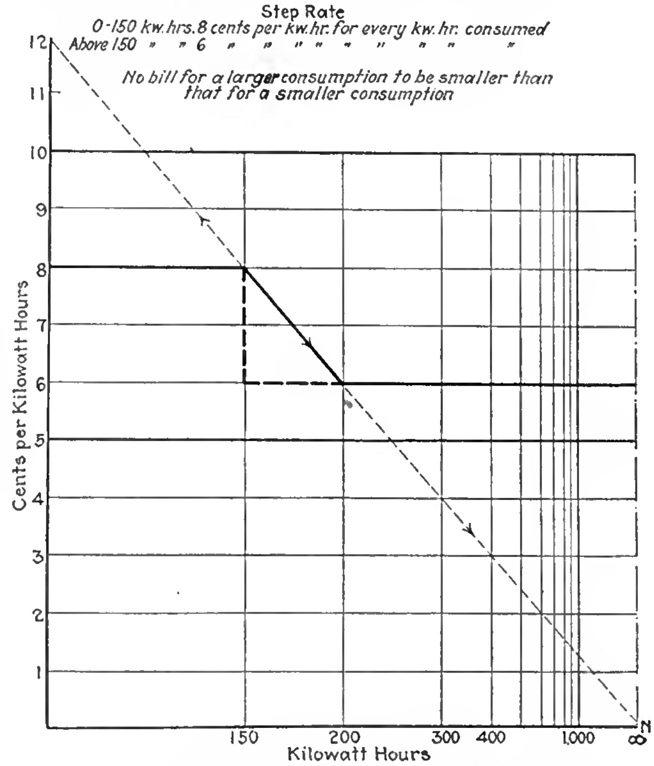

FIG. 2—CONVERTING STEP RATES TO STRAIGHT LINES

Another advantage is that the straight-rate lines are self-descriptive. By looking at a rate line of this kind one can read off the rate in words as easily as if it were printed, and even more readily. The breaks in the slopes indicate the ends of the blocks and the intersection of each straight line (or of its production respectively to the right) with the infinity line gives the cents per kilowatt-hour charged within the respective block. A rate curve under the old system has nothing to show to the eye what the charges are, and if the description of the sheet has been omitted or is not at hand, it is not possible to find what the rate is, except by solving equations with two unknown quantities.

This system of straight-line representation of rates is especially useful in designing new rates to take the

place of existing ones. In this case one wants to know what the resulting changes are in the cent-per-kilowatt-hour charges if certain features of the rates are changed—for instance, the length of a block or the charge per increment kilowatt-hour in that block, or both. The effect of these changes in one or more blocks can be demonstrated by simply tracing a straight line. The connection between the original rate and the tentative new rate is much clearer than under the old system with its elaborate calculations and curve tracings.

It is known, for example, that the rate line in every block of any block rate, no matter what the upper and lower limit of that block or how high the rate is for a certain energy consumption, converges to the same point of the infinity line as long as the increment kilowatt-hour charges within the block are the same. Two parallel rate lines indicate always that one rate is lower than the other one by a certain constant number of cents per kilowatt-hour, this number being given by the vertical distance between the two straight lines. Two lines intersecting at any point on the horizontal zero line (bottom line) of the diagram mean that one of the two rates is lower than the other one by a certain constant percentage—for instance, in consequence of a percentage discount.

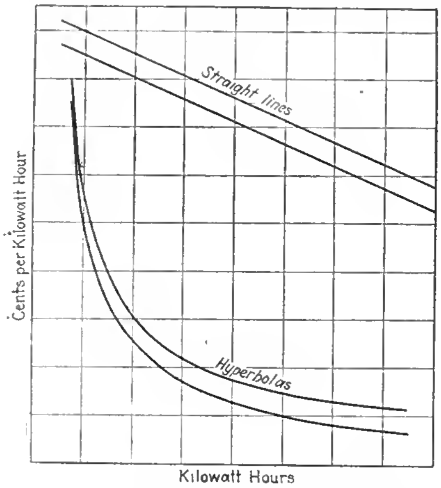

FIG. 3 — COMPARISON OF HYPERBOLAS HAVING A CONSTANT VERTICAL SEPARATION WITH STRAIGHT LINES HAVING A CONSTANT VERTICAL SEPARATION

As shown in the theoretical part of the book on rates quoted above, the total amount in dollars and cents charged under any block rate can be resolved into a constant amount plus another amount which is proportional to the total number of kilowatt-hours consumed. These two component parts of the charge are also easily evident from the straight-line representation. A parallel to the rate line is traced through the bottom of the infinity line. This parallel intersects the 10-kw.-hr. or the 100-kw.-hr. or the 1,000-kw.-hr. line, etc., respectively, at a height above the zero line which is one-tenth, one-hundredth, one-thousandth, etc., of the above-named constant component of the charges. The amount proportional to the total number of kilowatt-hours is, of course, equal to the kilowatt-hour charge per increment kilowatt-hour in the respective block and is given, as stated above, by the intersection of the rate line with the nearest infinity line to the right. Thus the equivalent two charges in the third block (3 cents per kilowatt-hour for every kilowatt-hour between 30 and 150) of the 10/5/3/1-cent rate dealt with in Fig. 1 will be found as 1.1 × 100 + 3 cents per kilowatt-hours, or \$1.10 + 3 cents per kilowatt-hour. This can be seen, on the one hand, from the intersection point of the parallel $C''N$, for instance, with the 10-kw.-hr. line, which takes place at 11 cents per kilowatt-hour, and, on the other hand, from the intersection of $C_1D_1$ with the infinity line at 3 cents per kilowatt-hour.

From this is seen the following general law: The slope of the line determines the additive constant (equivalent customer charge) of the respective block, and the intersection of the line with the infinity line determines the cents-per-kilowatt-hour charge for the increment kilowatt-hour in the respective block.

The hyperbolic scale offers the same advantages where the cents per kilowatt-hour are to be plotted against the load factor. This is often done to advantage where a certain charge is made per kilowatt with or without the addition of a separate kilowatt-hour charge. Here an even greater simplification is noticeable through the use of the hyperbolic scale.

Take, for example, as a simple case, the following Hopkinson rate: \$3 per kilowatt per month and 5 cents per kilowatt-hour. The average charge per kilowatt-hour varies not only with the energy consumption but also with the demand. With the energy consumption as abscissas, there would have to be separate curves for several representative demands; for instance, for 50, 100, 200 kw., etc. If, however, the cents per kilowatt-hour are plotted as a function of the load factor, a single curve will suffice which applies to every kilowatt demand.

To construct this curve choose one section of the scale for the range from 10 per cent to 100 per cent load factor (Fig. 4). If it is desired to take load factors of less than 10 per cent into the scope of the investigation, the preceding section might be used also or the scale extended back to 9 per cent, 8 per cent, etc., as desired. Choose, for example, a demand of 50 kw. (the demand cancels out later) at 10 per cent load factor. This means that the energy consumption is 0.10 × 50 kw. × 730 hours = 3,650 kw.-hr. The total bill is then (in cents) 50 kw. × 300 cents per kilowatt-hour + 3,650 kw.-hr. × 5 cents per kilowatt-hour, and the average charge in cents per kilowatt-hour is [(50 × 300) ÷ (0.10 × 50 × 730)] + 5 = 9.11 cents per kilowatt-hour. At infinity load factor the demand portion would be zero,

RATE SYSTEMS AND GRAPHICAL POSSIBILITIES

* In case of a Hopkinson or Wright rate without blocks, the same rate line applies to all demands with method 5 and to all energy consumptions with method 6.

and at the infinity line (which now represents "infinity load factor") the average charge per kilowatt-hour will be equal to the energy charge of 5 cents per kilowatt-hour. Connection is made on the chart by a straight line between the point 9.11 at 10 per cent load factor with the point 5 cents per kilowatt-hour on the infinity line, and the desired rate curve appears as *AB* (Fig. 4).

If there are blocks in the Hopkinson rate, even this load-factor rate curve will in general vary with the demand, and it will be necessary to draw separate rate curves for a number of representative demands.

Take, for example, the Hopkinson rate just quoted but modified by the addition of blocks for the higher kilowatts and kilowatt-hours, as follows:

$3 per kilowatt per month for the first 100 kw.
$2 per kilowatt per month for all kilowatts in excess of 100 kw.
5 cents for the first 5,000 kw.-hr.
3 cents for the next 5,000 kw.-hr.
1 cent for all kilowatt-hours in excess of 10,000.

The curve for 50-kw. demand will remain unchanged from the above until it reaches the load factor at which the first block of 5,000 kw.-hr. is filled, that is at 5,000 kw. ÷ (50 kw. × 730 hours) = 13.70 per cent* (point *C*, Fig. 4). From there on it is necessary to draw a straight line *CD* to the point of 3 cents on the infinity line. This straight line is the rate line until the second block of 5,000 kw.-hr. is filled, which takes place at 2 × 13.70 per cent = 27.40 per cent. Connecting the point *E* at 27.4 per cent of the last-named rate line with the point *F* at 1 cent per kilowatt-hour on the infinity line furnishes the rest of the rate curve up to the 100 per cent point. In like simple manner the rate curves for 100 kw. and 200 kw. are constructed. They are also entered in Fig. 4.

This example furnishes an instance of the general type of rate, inasmuch as the kilowatt charge and the kilowatt-hour charge decrease with increasing demand or energy consumption respectively. The average charge in cents per kilowatt-hour depends then on both the demand and the energy consumption in such a way that one can no longer use a single curve with the load factors on the base line, as was possible with the elementary Hopkinson rate (*AB*, Fig. 4). In this case nine different methods can be used for the representation of the rate on paper, as explained in the following. Only one of these nine methods has been applied in the example above.

### General Type of Rate

The monthly or annual charge made under any electric rate is practically always a function of not more than three variables, viz., the energy consumption, the demand, and the time at which the energy has been consumed. The latter element cannot be taken care of in the graphical representation otherwise than by tracing different curves for the different times at which the energy is being consumed or, in other words, at which the demand occurs. It can therefore be disregarded for the present purposes.

Instead of either one of the variables, demand and energy consumption, the load factor can be substituted as variable and the general problem thus becomes: What is the average charge per kilowatt-hour for any possible combination of values of the following sets of variables: (1) Demand and energy consumption, (2) demand and load factor, (3) energy consumption and load factor?

This means that there are the following combinations of variables: (A) Average charge, demand and energy consumption; (B) average charge, demand and load factor; (C) average charge, energy consumption and load factor.

Given any two variables in any of the three last-

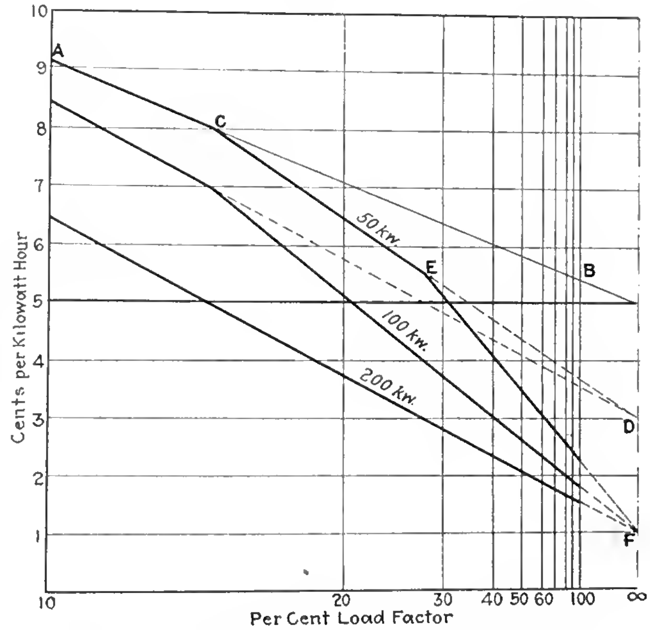

FIG. 4—HYPERBOLIC SCALES APPLIED TO RATES PLOTTED TO LOAD FACTOR

named combinations, it is requisite to show graphically what the third one is. This cannot be done by curves in a plane otherwise than by assuming one of the three variables at a number of representative constant values and drawing a separate curve between the two other variables for every one of these representatives values.

Thus under (A) one might draw a number of curves showing the average charge with varying energy consumption if the demand is 50 kw., another curve for a demand of 100 kw., another for 200 kw., etc. Or one may draw another family of curves showing the average charge (cents per kilowatt-hour) with varying demand, one curve for a given energy consumption of, let us say, 500 kw.-hr., another for 1,000 kw.-hr., a third one possibly for 1,500 kw.-hr., etc. Or it might be shown by a curve between demand and energy consumption how the energy consumption varies with the demand if the average charge per kilowatt-hour is, for instance, 6 cents, by another curve the variation is shown for a constant value of 5½ cents, then for 5 cents, 4½ cents, etc., as far as the circumstances make advisable.

Likewise three different types of curves are arrived at for combination (B) and three for combination (C) —altogether nine different possibilities for the representation of the rate on a plane. Seven of these result in rate curves which are hyperbolas if straight arithmetical scales are used vertically and horizontally; therefore they will turn to straight lines if the horizontal (or vertical) scale is a hyperbolic one as described above. The remaining two possibilities result in straight lines if straight arithmetical scales are used, and the use of a hyperbolic scale would therefore complicate matters in these two cases. The table

*On a regular hyperbolic sheet for practical use sufficient subdivisions will be entered to allow the point 13.7 per cent to be found with practical accuracy. If such is not the case, it is easy to find on the slide rule the distance of this point from the 100 per cent point of the scale, as 1/1.37 = 73.0 per cent of the distance between the 100 per cent and 10 per cent points of the scale.

enumerates the nine possibilities, and in addition it shows which of these result in straight lines on ordinary arithmetical scales and which require the use of the hyperbolic scale to straighten them.

The proof for the statements of the last two columns in this table follows naturally from the material provided in the present author's serial "Some Geometrical Aspects of the Three-Charge Rate System,"† especially with reference to its Figs. 7 and 8a to 8m, but no space shall be taken up with this proof here.

Where it is desired to compare two or more rates with either an explicit (Hopkinson) or an implied (Wright, etc.) demand charge, the comparison by means of the curves described so far—that is, by means of families of curves showing the average charges in cents per kilowatt-hour—becomes difficult and unsatisfactory.

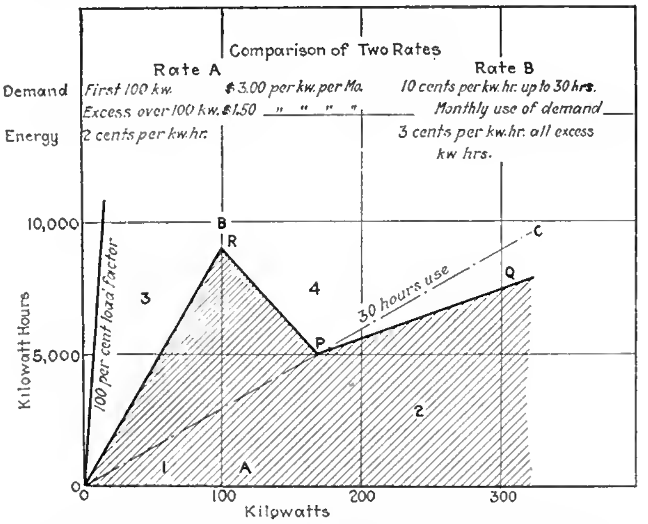

FIG. 5—ALL CUSTOMERS REPRESENTED BY POINTS IN THE SHADED AREA PAY MORE UNDER RATE A; THOSE IN THE NON-SHADED AREA PAY MORE UNDER RATE B

The following straight-line method is preferable. Lay out a system of co-ordinates with the kilowatts demand as abscissas (horizontal) and the kilowatt-hours consumption as ordinates (vertical) (Fig. 5). The points with equal load factors are then located on straight lines radiating from the origin 0. As far as the charges are concerned, every customer is characterized by a certain definite combination of demand and energy consumption; that means, he is characterized by a certain point in the system of co-ordinates just described. For the points on certain portions of the area of this system, rate A will be higher than rate B, and for the others the reverse will take place. One has now only to determine these portions of the area, and it can be seen at a glance for which customers rate A is higher and for which rate B. These areas are determined by straight lines whenever two three-charge rate systems are to be compared,‡ taking the term "three-charge system" in its widest meaning—that is, including those special cases where one or two of the three charges are zero. It will then be hard to find a rate system which does not come under the heading of "three-charge rate system."

A simple example shall illustrate this method. Let one of the two rates be a Hopkinson rate with the demand charge of $3 per kilowatt per month up to a demand of 100 kw., this charge to be reduced to $1.50 for every kilowatt above the first 100 kw. The energy charge is 2 cents per kilowatt-hour. The other rate, B, is a Wright demand rate as follows: 10 cents per kilowatt-hour for the first 30 hours' monthly use of the demand and 3 cents for every kilowatt-hour above that load factor.

Under rate A the average charge per kilowatt-hour follows a different law for the demand above 100 kw. from that for the kilowatts below 100. The line showing where rate A and rate B make the same charges may therefore be expected to have a break at the 100-kw. line *AB* in Fig. 5. Likewise the Wright demand rate B changes along the 30-hour monthly use *OC*. Thus there result four ranges (I, II, III and IV in Fig. 5), defined by the dash-and-dot lines *AB* and *OC*.

Calling $d$ the demand of a customer in kilowatts and $e$ his energy consumption in kilowatt-hours, then the total charges per month $a_A$ under rate A in cents per month will be $a_A = 300d + 2e$ as long as $d < 100$ kw.; that is, in ranges I and III (Fig. 5).

Where $d > 100$ kw. there results:

$a_A = 300$ cents per kilowatt $\times$ 100 kw. $+$ 150 cents per kilowatt $(d - 100\text{ kw.}) + 2e$

$= 15{,}000 + 150d + 2e$ ranges II and IV

Likewise we get for rate B:

$a_B = 10e$ ranges I and II

$a_B = 10 \times 30d + (e - 30d) \times 3 = 210d + 3e$ ranges III and IV

The locus of all combinations of demand and energy for which rate A charges the same as rate B is a straight line within each range. For all customers whose characteristic points are above this line rate A will be lower and vice versa. If it is desired to construct this straight line—for example, in Range IV—the amount $a_A$, which applies in this range, is set equal to $a_B$, also applying in this range, and there results:

$$15{,}000 + 150d + 2e = 210d + 3e,$$
$$15{,}000 = 60d + e,$$

which is the equation of a straight line.

To determine this line determine two of its points—for instance, the point on the line *OC* and the point on the line *AB*. In the former case $e$ will be $= 30d$, which changes the above equation to $15{,}000 = 90d$, from which $d = 166\frac{2}{3}$ kw.; consequently $e = 30d = 5{,}000$ kw.-hr. This gives point *P* in Fig. 5. The point on line *AB* is found by letting $d = 100$ in the equation of the straight line. This results in $e = 15{,}000 - 6{,}000 = 9{,}000$ kw.-hr. (point *R*). One thus gets the straight line *PR*, and repeated application of the same principle results in the construction of the broken straight line *ORPQ*. All customers whose demand and energy consumption is given by a point above that broken line will find the Hopkinson rate cheaper, the other ones the Wright demand rate.

†*Electrical Review and Western Electrician*, Feb. 11, 18 and 25, 1911.

‡Because the "rate surfaces" are planes. See "Rate Representation in Space," by H. E. Eisenmenger, ELECTRICAL WORLD, Nov. 4, 1911.

## Electrification Projects in Czechoslovakia

FOUR companies have recently been organized in Moravia, the leading agricultural province of Czechoslovaki, for the purpose of supplying the province with electric power. Plans include the utilization of power from Moravice and Dyje Rivers, says Consul C. S. Winans in a report to the Department of Commerce. Work has already been started on some of the plants. The cost of the scheme is estimated at 225,000,000 Czechoslovak crowns ($6,525,000), and most of the material will probably be purchased locally.

# The Residence Consumer—What He Costs and What He Is Worth

## Lack of Such Knowledge Prevents Intelligent Development Work—Attitude of Selected List of Middle Western Small City Companies — How Appliance Sales Increase Consumption

A GREAT deal is being said about the central-station commercial problem in convention and committee meetings. The sources of additional revenue open to some central stations, such as those in the big industrial centers, where all sorts of manufacturing industries are concentrated, are almost unlimited. In such sections the possibilities of commercial lighting and residence lighting and appliance loads are big, but smaller perhaps in the proportion of their total revenue-producing possibilities than the industrial loads. In these centers men of experience are available to work out the problem of proper development of all the varied kinds of business.

Unfortunately, from a load building standpoint, the larger area of the country lies outside these congested centers. By far the greater part is agricultural territory where population is limited. The general commercial activities of the central station are those necessary to serve the agricultural community, and such manufacturing projects as do exist are not an important source of load development. In such communities from perhaps 20 to 35 per cent, or at most 50 per cent, of the total revenue can be classed as commercial or industrial, and in some cases, particularly in very small communities, the revenue attributable to this class of business may drop as low as 10 per cent of the total. The direction in which revenue can be developed lies principally in the field of the small consumer and is largely a residential customer problem.

TABLE I—WHAT THE ORDINARY RESIDENCE CONSUMER PAYS TO THE SMALL-CITY CENTRAL STATION IN THE MIDDLE WEST

| Consumers | Average Monthly Kw.-Hr. of Residential Consumers | Average Monthly Revenue | Monthly Cost of Carrying Residence Consumers |
|---|---|---|---|
| 48 | 11.00 | $1.94 | ..... |

| 10,438 | 23 | 2 30 | 0.90 |
| 11,194 | 20.3 | 2.18 | 2.50 |
| 11,510 | 30 | 2.25 | 2.24 |
| 101,71 | | | |

These figures are taken from replies to a questionnaire on the subject of residential energy sales and revenue sent to thirty-five Middle Western utilities. They reveal a wide variation in monthly average consumption and revenue and indicate a widespread lack of knowledge of the cost of carrying residential consumers. The figures on these costs ranging from $2 to $2.50 per month are those which appear to be based on a careful study. In the majority of cases this sort of cost information is not in possession of utility organizations because no attempt has been made to analyze the costs.

At the convention of the Iowa Section of the National Electric Light Association in 1922 N. T. Wilcox said that the average residential lighting customer yields an annual gross income of about $20, and he went rather fully into the possibility of increasing this revenue through the medium of the electric range and small household refrigerator outfits as well as the smaller appliances. He made the statement then that through the medium of such devices there is the possibility of an annual revenue of more than $100 per kilowatt of station demand. The same possibilities were stressed in this year's convention of the Middle West Division of the National Electric Light Association at St. Louis.

In the various convention and committee discussions there has been evident a decided lack of knowledge as to just what the condition of the residential service is. Fundamentally there should be a knowledge of what it costs to carry the average residential consumer. By this is meant the fixed investment costs and maintenance of all plant equipment employed in this class of service plus the bookkeeping, meter reading and service costs without any charge for kilowatt-hours used.

### What the Residence Consumer Pays

Table I, which represents nearly 102,000 consumers, is taken from a recent survey made in the Middle West to ascertain if possible what the ordinary residence consumer uses in energy, the revenue that may be expected and the bare cost of carrying a consumer on the system before he is charged for energy. The figures are given exactly as they came from the various companies to show the wide discrepancies that exist for the highest and lowest reported average consumptions on different systems and the apparent lack of fundamental cost knowledge that prevails.

On the systems serving up to 1,000 consumers it seems that there is almost a total lack of knowledge of what it costs to carry a residential consumer. The four figures given are evidently an estimated cost of billing and meter-reading expense. On systems with from 1,000 to 5,000 consumers there is more information, though it is evident that there must be a serious lack of data as to the actual costs, since the discrepancies, after eliminating those that evidently cover billing and meter-reading costs only, is too great to represent a true knowledge of the situation, especially when studied in the light of the figures for systems having more than

5,000 consumers. On these latter systems, after eliminating several which clearly do not contain fixed investment and maintenance costs, costs of carrying residential consumers are given which show a monthly expense of \$2.25 to \$2.50. Nearly 26,000 consumers are represented in this group.

### WHAT THE RESIDENCE CONSUMER COSTS

In Table II are given some cost figures on residential consumers taken from data presented before the 1922 convention of the Northwest Electric Light & Power Association by George H. Davis of the Idaho Power Company and published on page 1398 of the Dec. 23, 1922, issue of the ELECTRICAL WORLD. The cost of carrying residential consumers is given at \$2.25 per month, or \$27 per year. In the Oct. 28, 1922, issue of the ELECTRICAL WORLD, page 929, in an article by Messrs, Greene, Schoonmaker and Gorton on the allocation of electric service costs, are found residential consumer costs of \$1.03 per month and demand costs of \$1, or a total of \$2.03. While these figures are not based on one specific community, they represent costs that are typical for many communities in Iowa. Another careful analysis covering very small communities on a large Middle West system the name of which cannot be given has shown a monthly cost of \$1.20 for consumer and \$1.20 for demand costs. This represents small communities containing in the aggregate several thousand consumers fed from a transmission system and the figures were prepared with enough care to render their practical accuracy unquestioned.

It would appear fundamental in dealing with residential business development that there is room for a great deal more work in ascertaining the cost of giving service. There is considerable ground for suspecting that the cost of carrying the average residential consumer on Middle Western properties, outside industrial districts, lies somewhere around \$2 to \$2.50 per month, or \$24 to \$30 per year, for all costs except the actual production cost of energy delivered. If this is the case, then the average revenues shown in Table I and that indicated in Mr. Wilcox's statement before the Iowa convention show a discrepancy between costs and revenue that is a serious problem and one only aggravated by the addition of such consumers.

The remedy is the development of greater use of energy by the individual consumers. Just how this is to be done is the question around which the present discussion is revolving. The three principal suggestions are: (1) An increase in the size of lamps used and a higher standard of illumination. This has obvious limitations. (2) An increase in the use of the smaller appliances. This again has limitations, although both in the number of appliances in use in a home and in the extent of their habitual use it is susceptible of a very great development. (3) The general adoption of the electric range and refrigerator in domestic service.

A number of companies that have made a definite attempt to increase the use of electric light in the household report considerable progress and benefit. There is a surprisingly large number of customers who buy lamps smaller than the 40-watt size and will continue to do so for many purposes, and there is also a lamentable proportion of empty sockets. Considerable can be accomplished, however, by informing and reminding the public of the advantages of larger lamps and better light, but in communities of this size in this section it is necessary, in order to influence the situation much, to obtain and sustain the co-operation of the local merchants who sell lamps. Lamps are sold in a large proportion of the general stores in small towns, and it is a matter of considerable importance to the lighting company that a working basis of co-operaton be established between all these retail outlets and the utility both for the service of the public and the guidance of lamp selection.

In canvassing this selected list of thirty-five Middle Western small city central stations the direct question was asked: "What special efforts are you making to increase your average monthly residential bills?" One reported that it was pushing larger-voltage lamps primarily, sending men from house to house to repair bad sockets. Another said that it was campaigning on the sale of a kitchen lighting fixture which uses a 150-watt lamp. Several mentioned activity in this field of lighting as a part of a general effort to get more business. Twenty-five companies particularly specified appliances as their chief interest at the moment. The following statements are typical:

1. "Pushing the sale of appliances both in our jobbing department and also by drug stores, hardware stores, plumbing shops, etc., that might sell such appliances in our city."
2. "Holding demonstrations for the sale of electrical appliances, particularly cooking devices."
3. "Promoting the use of grills, small stoves, percolators, washing machines, cleaners, etc. Most customers now have flatirons."
4. "Pushing the sale of appliances of all kinds."
5. "By maintaining a free inspection service, following the regular meter routes, we are able to sell and demonstrate the use of appliances and better lighting. These appliances are carried in an electric truck as a base."
6. "Sending men to homes of consumers to make minor repairs to appliances and ascertain just what they have, so we may know where to push lamps and appliances."
7. "Having our salesmen concentrate on revenue-producing appliances. Considering developing an electric home for display purposes."
8. "Pushing electrical appliances in general and making special effort on ranges."
9. "Selling ranges, washing machines, irons, sweepers, electric incubators, etc."
10. "We have built a model electric shop and have a low cooking rate and make a special effort to develop this business by selling electric ranges at cost and donating the wiring. Electric cooking, we believe, offers the biggest chance for expansion in the residence field."

Two companies made a particularly interesting report on their experience in the sale of electric ranges, which will be made the substance of a further article. They are successfully concentrating on the development of a range load, considering it their most promising opportunity.

### BILLS LARGE ENOUGH

Letters were also received from ten other companies reporting no effort to increase business. These are interesting, too, as indicating a lack of appreciation on the part of some central-station executives that the unit of residence business is, after all, the home and that every household is susceptible to the appeal of electric service if its many diverse benefits are adequately interpreted. One man says in answer to the same question ("What effort are you making to increase residence bills?"): "None. Feel that bills are large enough. Irons and lights are about all the small-town man can use electricity for to advantage in his residence. Believe it more satisfactory to get more customers than to run bills up on present consumers." Yet it is surely a fact that floors must be swept in the small-town home, and clothes must be washed, and coffee is made, and toast also, and baby bottles are warmed, and a cool

breeze is as much enjoyed as in any dwelling in the large city. Moreover, the small-town man has money which he is quite as glad to spend on the things his family needs and wants, as is evidenced by the number of automobiles that are owned in every village, and there is a considerable proportion of them that are medium-priced or expensive cars. The families that use these cars should certainly buy electrical appliances if they are properly sold.

Another company writes: "None. Rates as low as we can possibly make them to the customer on our investment." The assumption here seems to be that the only way to sell more service is to cut the price. But the small-city public does not buy these things on price or it would buy transportation only in the form of Ford cars. With the low rates obtaining in this town there should be no obstacle to the sale of more and more appliances and better and better light until the houses are all completely equipped and properly illuminated.

Several other companies report no capacity, and the

TABLE II—COST OF CARRYING RESIDENTIAL CONSUMERS
(Presented by George H. Davis, Idaho Power Company, at the 1922 Convention of the Northwest Electric Light and Power Association.

| | |
|---|---|
| Annual generation, transmission and transformation costs | $14 25 |
| Annual distribution costs | 5.25 |
| Annual customer costs | 7.50 |
| Total annual costs | $27.00 |
| Average per month | 2.25 |

rest simply answer that they are doing nothing to build up business. The predominant note for the entire list, however, is optimism and confidence, and no man can doubt that all of them will recognize the opportunity.

Just what can be accomplished in increasing residential consumption by introducing larger lamps and by the sale of more appliances is shown in the series of curves herewith. These four curves are taken from the records of a Middle Western transmission system and embrace twenty-nine towns ranging in size from about 80,000 to less than 1,000 population. On this system special attention is paid to the merchandising of appliances from the central-station salesroom and also to the encouragement of the independent dealers to do a better merchandising job and become more prosperous. Every town where an office is maintained has a display room appropriate to the size of the town, and no reasonable expense is spared to make it the most enterprising and attractive electric shop in town. Sales campaigns are carried on from time to time in which seasonable appliances are pushed. These campaigns are not heavy, whirlwind selling ventures, with a slump between times, but a steady, consistent effort in which the particular articles featured are varied to suit the season of the year.

These curves are typical for the entire system, being selected to show the results for the largest, the medium and the small-sized communities served. The records extend back to 1917, and the monthly average kilowatt-hour consumptions for 1921 and 1922 are available. The average monthly consumptions since 1917 have increased between 50 and 100 per cent for all the communities that have been served during that period. The appliance load involved consists mainly of the smaller household equipment, and with all that has been accomplished it seems fair to question whether these devices alone are of sufficient energy-consuming capacity to

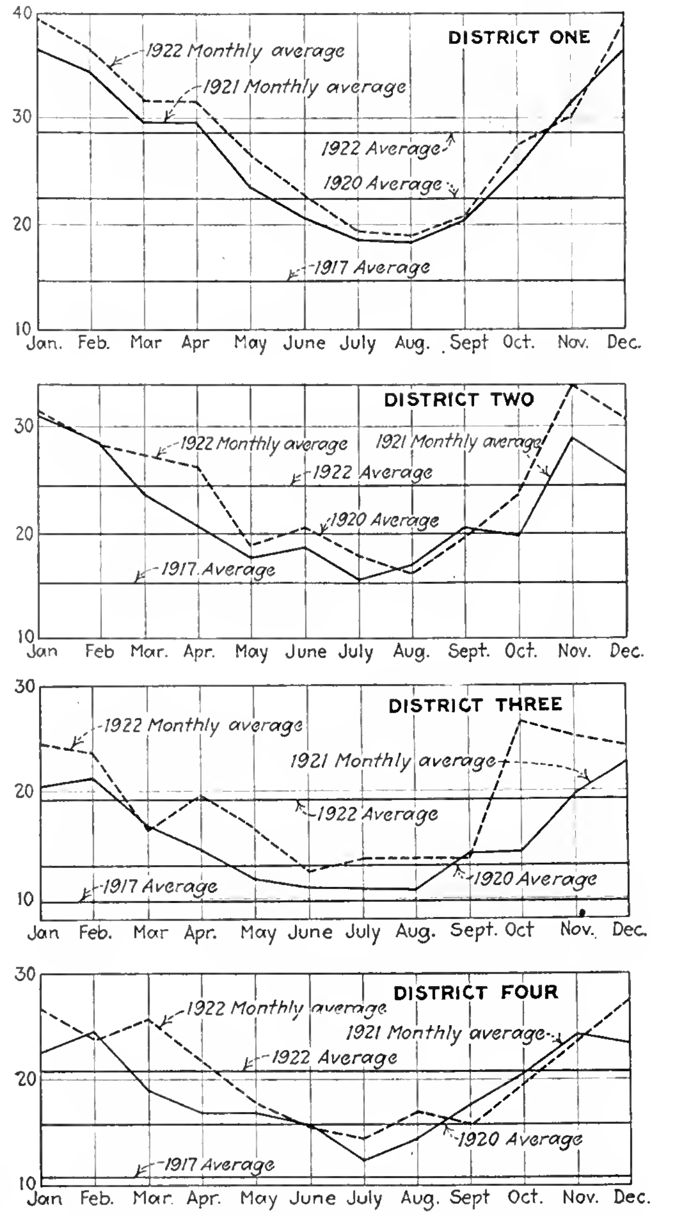

FIG. 1—RESULTS FROM INTELLIGENT EFFORT IN PROMOTING BETTER RESIDENCE LIGHTING AND SALE OF APPLIANCES

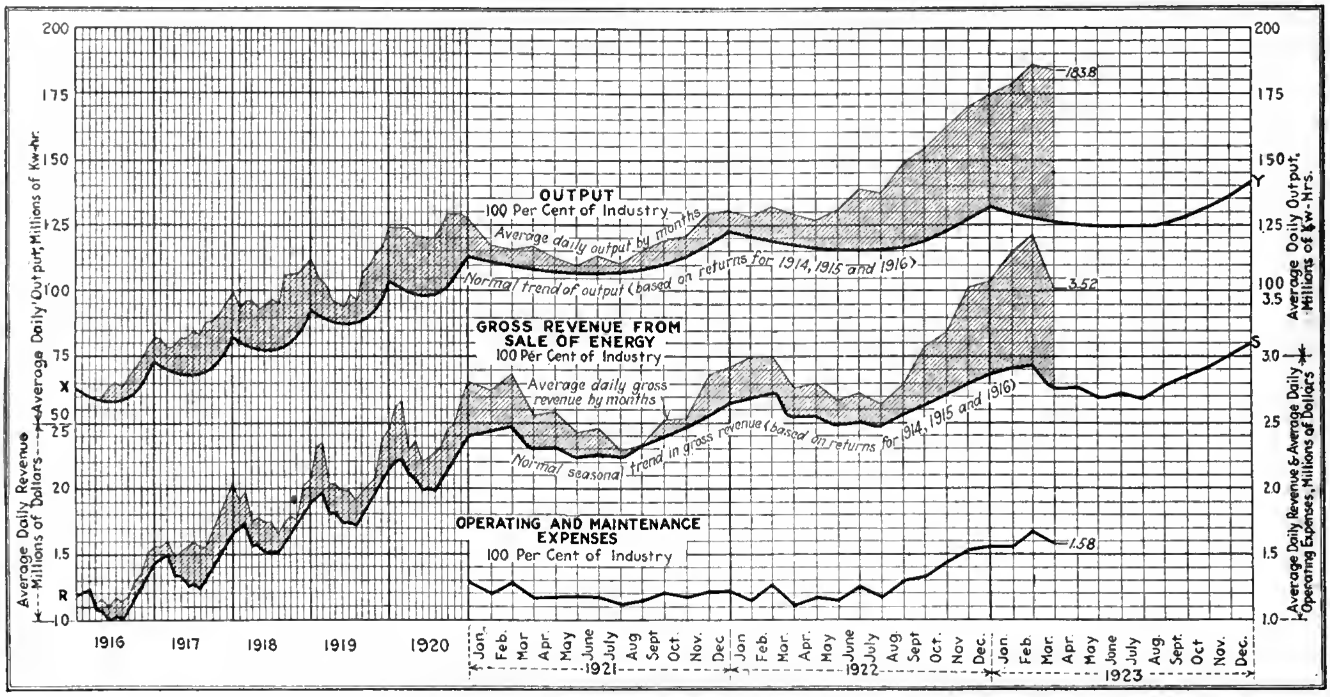
District 1 is for a city of 80,000 population, District 2 for one of 10,000, District 3 for one of 1,500 and District 4 for one of 1,100.

bring the average to a point where the residential service ought to be.

This statement in no way questions the value of ordinary appliance sales, but merely points the fact that usage is such that the smaller appliances alone are not a solution of the problem. They provide a profitable load whose importance is tremendously enhanced by their effect in popularizing electricity in the home. Opinion, however, seems to be steadily strengthening that adequately to solve the residential service problem more attention must be given to the electric range.

## Two Chief Factors

To sum up the principal factors in the present discussion of the Middle Western smaller central-station situation as it affects the residential customer, it seems fair to question, in the first place, whether there is an adequate knowledge of the bare cost of handling such consumers, and without this knowledge no really intelligent means of solving the problem can be devised.



DURING MARCH THE CENTRAL STATIONS OF THE COUNTRY SOLD A TOTAL OF 5,690,000,000 KW.-HR., OR A DAILY AVERAGE OF 183,812,000 KW.-HR.

in its solution the smaller electric appliances are a necessary factor and extremely important because of their effect in popularizing electricity in the home.

The final factor in increasing residential consumption, in as far as the present outlook goes, appears to be the use of the larger appliances, such as the electric range and the household refrigerating outfit. There are ample data available to indicate that the range is no longer an experiment. In the smaller communities where gas is not a possibility the electric range has arrived as a commercial proposition and needs only intelligent handling. The refrigerator has so far been somewhat an object of suspicion because it is not so far advanced as the range; but one unusually capable central-station executive in the Southwest told an ELECTRICAL WORLD representative this spring: "We are satisfied that the refrigerator has arrived. This year we will put all our energies behind it and expect to influence our residential sales materially."

## Record Output During March

REPORTS received by the ELECTRICAL WORLD for the month of March from central generating and distributing companies representing 72 per cent of the installed generator rating of the country indicate that a new output record was established by the industry during the month.

The average daily output during March was 183,812,000 kw.-hr., which was slightly below the record figure set during February. However, the total output for the month of March was 5,690,000,000 kw.-hr., which was about 160,000,000 kw.-hr. in excess of the previous record figure set during January of this year. This was the first instance in the recent history of the industry in which the operations during March have exceeded the previous December, January and February. In the first quarter of the year the central-station companies of the country sold a total of 16,400,000,000 kw.-hr. of electrical energy, which was 27.8 per cent over the amount sold during the first quarter of 1922. Such operations point unmistakably to the most prosperous year in the history of the central-station industry.

The average daily revenue from the sale of energy during the month was $3,522,000, which was $402,000 under the record figure set during February. The total gross revenue for the month was $49,100,000, which was about $300,000 below the record figure for revenue set during January. The total gross revenue for the first quarter of the present year was $149,200,000, as against $119,000,000 for the first quarter of 1922, or an increase of 25.2 per cent. If these percentage gains in output and revenue were to continue throughout the year, the indications would be that the output of the industry is doubling about every three and a half years and that the revenue doubles about every four years. Given the proper background of general industrial prosperity, there is no doubt that this rate of growth will continue for several years to come.

# National Superpower Scheme

## Frank G. Baum, After an Extensive Study and Survey of the Power Resources of the Nation, Outlines a Constant-Potential Transmission System of Immense Magnitude

READERS of the ELECTRICAL WORLD are familiar with the superpower survey made by the United States Geological Survey in the district extending from Boston to Washington. A much larger survey, nation-wide in its scope, has been completed by Frank G. Baum, well-known consulting engineer of San Francisco, whose most recent accomplishment was the Pit River development of the Pacific Gas & Electric Company. Mr. Baum has divided the country into twelve regional power districts, all of which would be interconnected to obtain the greatest possible benefits from diversity, service, insurance, etc. The main features of such a system are given here: Mr. Baum in his "Atlas of U. S. A. Electric Power Industry," now in press, gives a wealth of supporting data from which his conclusions are drawn.

On page 1274 are shown the suggested regional electric power districts and proposed main routes for lines representing such a national power system. For some of the Eastern states a system of this kind has been very much needed. The reasons which led Mr. Baum to choose the routes indicated are given by him as follows:

"Lines to be built from the Adirondacks to New York with a connection to District 1 are shown, in view of the New England States being short of water power. District 1 may in addition in time get some water power from Canada, and two proposals for bringing power from Canada are now under consideration. From the Adirondacks the line would finally extend back to the St. Lawrence water power. A second line would be required to take the St. Lawrence power to New York, and this could be from the St. Lawrence River southerly toward Utica and then to the metropolitan areas. In time two tower lines over each route to carry a total of 1,200,000 kw. may be required for the Adirondack and St. Lawrence power.

"A line is shown extending from Niagara Falls southeasterly to the metropolitan area and connecting southerly through the Susquehanna River region with the Susquehanna power at Holtwood and the Niagara power and the St. Lawrence power, interconnected as shown, through Philadelphia and the industrial regions of eastern Pennsylvania west of New York. From Niagara a second line is shown extending westerly to Erie, Cleveland and Toledo, connecting with the power systems of Michigan and going westerly, finally connecting with the large steam plants on Lake Michigan. The two lines from Niagara would require 600,000-kw., 60-cycle power, available at Niagara. Steam reserve for District 2 may come from District 5 over the connecting lines shown. This will result in great savings of anthracite coal and reduce rail transportation of coal over the Allegheny Mountains.

"A line is shown in district 5 extending westerly from Pittsburgh to Columbus, Dayton (connecting with Indianapolis), Cincinnati and Louisville. This is an easterly and westerly high-tension power route to which available water-power and large steam-power stations should supply their output. Some water power can be delivered to the Pittsburgh district by power lines from branches of the Allegheny, Monongahela and Youghiogheny rivers. A line is shown running southeasterly from Cincinnati and from near Columbus, Ohio, to Charleston, W. Va., and thence over the Appalachian range, connecting with the system of the Southern Power Company. The upper Kanawha River and the New River can be developed to yield quite a large amount of water power, sufficient to justify a double-circuit, 220,000-volt transmission line. Along the Kanawha and New Rivers there could also be large steam plants using the coal of this region. This line would serve a very valuable function in feeding power into District 5 and also acting as a steam reserve plant to District 3 for the systems east of the Allegheny Mountains. District 2 may finally get some steam power from this region.

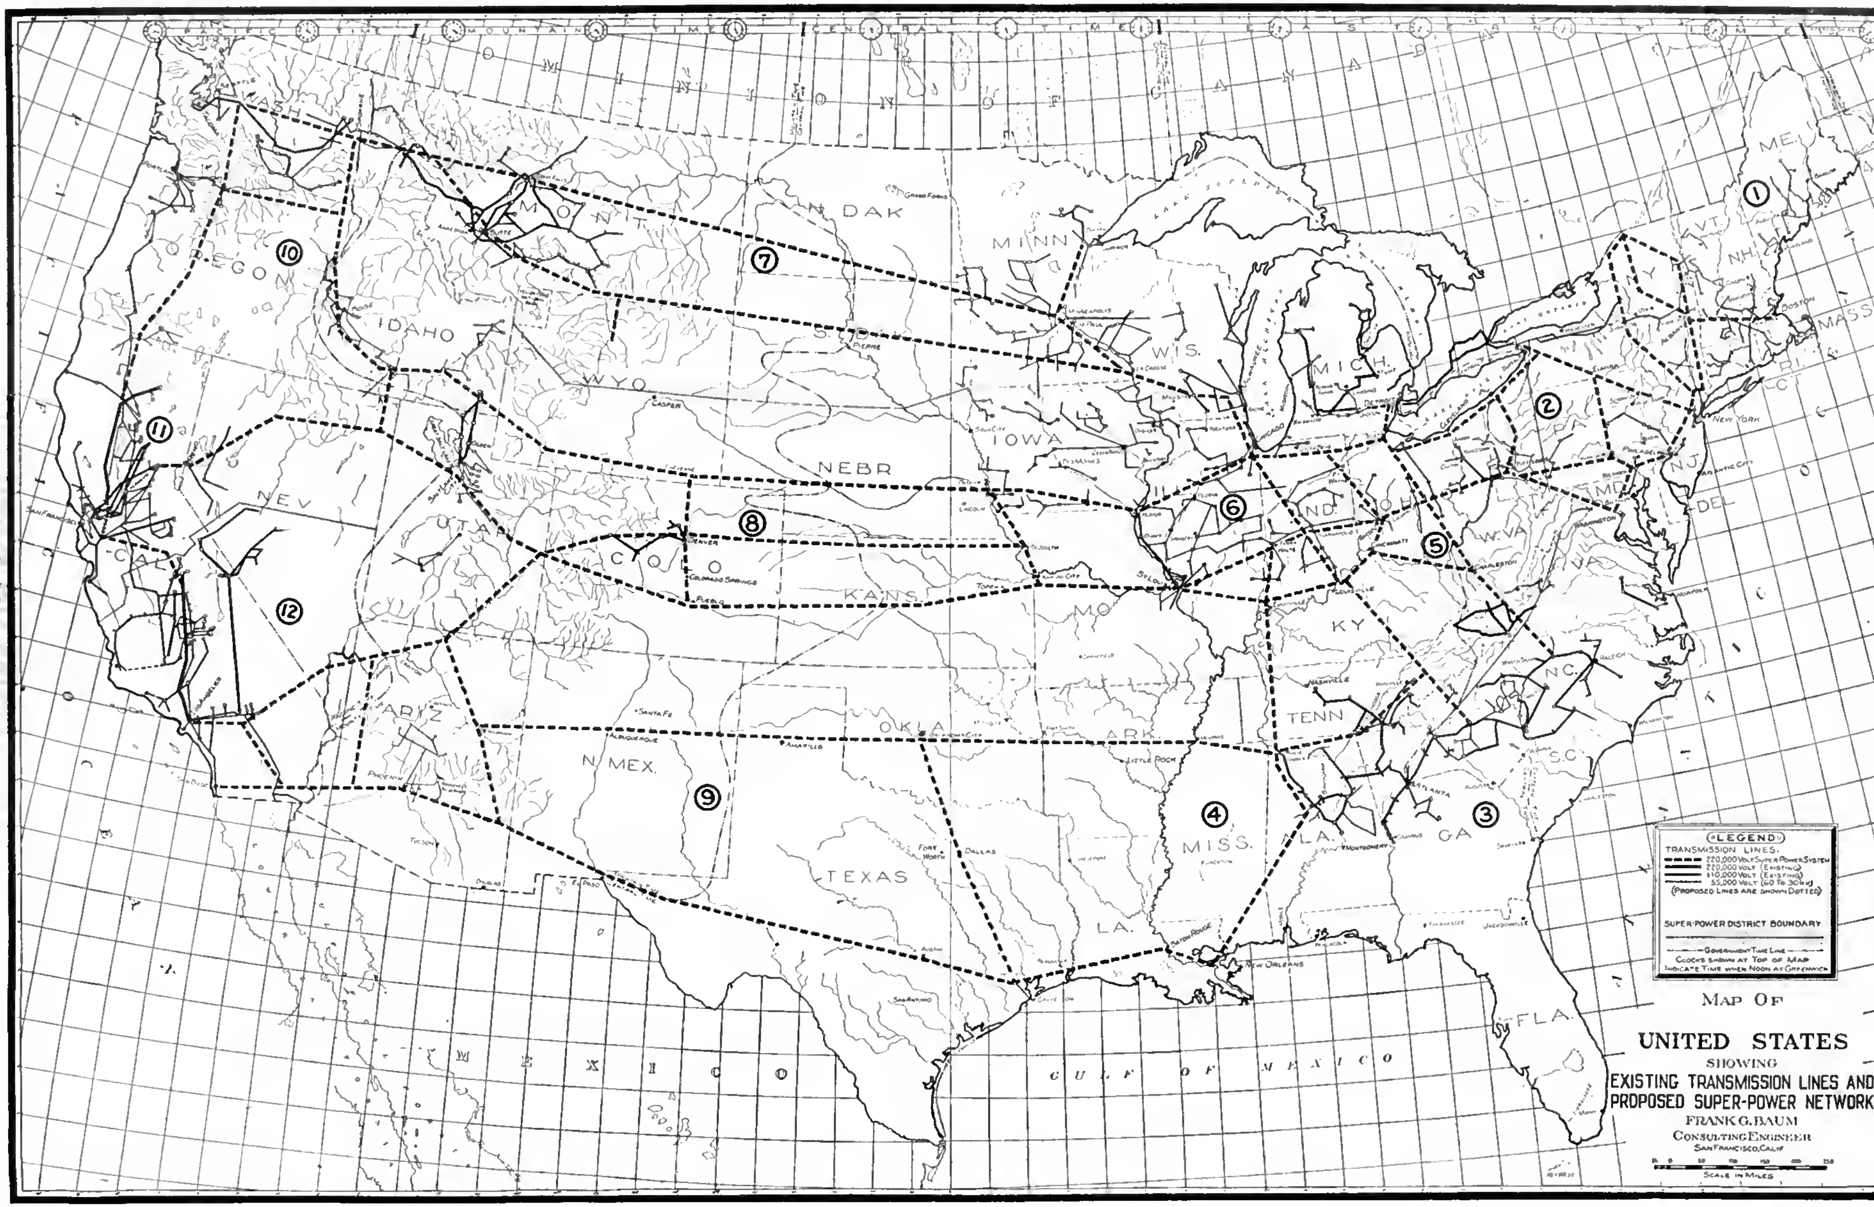
"No 220,000-volt lines are shown in District 3 except those bringing steam reserve and water power over the mountains from Districts 5 and 4. From Louisville, extending southeasterly, another trunk line is shown, going to the branches of the Tennessee River, where a considerable amount of water power can be developed. It is probable also that steam plants could be located on this line and a line connected across the mountains for reserve to the systems in District 3, east of the Appalachians, as shown. Another line is shown extending from Muscle Shoals northerly, to connect with the trunk line to Louisville and St. Louis, as this seems the best means of disposing of this power at this time.

"It would seem logical that the Muscle Shoals power should finally be used largely in District 4, but it will take some time for this market to develop, as outside of Alabama no large market is now available. But with the reclamation of the lower Mississippi, which contains the largest undeveloped land area in the United States, large amounts of power will be required, and I have therefore shown the Muscle Shoals lines as running westerly across the Mississippi near Memphis and southerly to New Orleans, and westerly from New Orleans into Texas, connecting with the power lines finally to be built to supply Region 9 from the power of the lower Colorado River and power developments in Texas and Oklahoma. Some of this power could be developed from the waste gases of the oil fields. The lines radiating in eastern Oklahoma are to take away the power from the gas fields.

"District 6 is largely a steam-power district, which may be used to balance the water power flowing toward this district from all directions. Fortunately District 6 has large coal resources. District 6 may finally get some water power from Minnesota and Manitoba.

"From the power available on the upper Missouri River and its branches trunk lines are shown going easterly which could supply the three northern railway routes with power for electrification, one main power line going to Minnesota and St. Paul and connecting finally with Milwaukee as shown.

"From the upper Colorado River three lines are shown



**Baum Plan for National Superpower Development, Utilizing Natural Resources to Maximum Advantage**

Four main power problems confront the industry. One is the development of water powers and supply of markets in District No. 2. The second involves the same problems for District No. 5. The third is to find a market for Rocky Mountain power. The fourth involves the same problem for District No. 10.

going easterly, one along the route of the Union Pacific, another along the route of the Santa Fé, the third being intermediate.

"In the Pacific Coast states, in District 10, the market conditions have not yet developed sufficiently to determine all the main trunk transmission routes. Districts 11 and 12 have already 220,000-volt lines, which are shown as part of the entire system as outlined. The new plant being built on the Tuolumne River for San Francisco should connect the 220,000-volt lines of District 11 with those of District 12 as indicated. This is a practical example showing the value of such a transmission system.

"It is thus seen that there are four main power problems confronting the industry. One is to develop the water powers and supply the markets of District 2. The second is to develop the water powers on the Ohio River drainage to supply the markets of District 5. The third problem is to find a market for the power in the Rocky Mountains, and it seems that this latter must be done largely by taking the power easterly along the railway routes as shown. (This problem of taking the surplus power from the Rocky Mountains to the Mississippi Valley may require in the future 330,000 volts, but initially 220,000 volts will suffice.) The fourth problem is to find a market for the very large amount of water power available in the states of District 10—Washington, Oregon and Idaho—and in this region should be located at various points some large power-using industries, such as are now near Niagara. All of these problems require for their best solution large-capacity transmission systems."

# Superpower as a National Policy*

## Not Engineering Obstacles but Legal, Political and Financial Difficulties Stand in the Way of Vast Interstate Networks—Mining and Railroad Loads Waiting—Civilization and Superpower

By M. H. AYLESWORTH
*Executive Manager National Electric Light Association*

THE idea of bulk supply is not new. It is as old as the electric lighting industry itself. From the very beginning it was recognized that the economics of the situation demanded that the supply of electricity for the home, for the store, for the factory and for transportation come from one central source. Superpower is merely an elaboration of the central-station principle making for the greatest possible economies and conservation and enabling the electric light and power industry to keep the price of its service constant in the face of enormous increases in the cost of labor, fuel, equipment and supplies.

Considering the numerous and marked advantages which accrue from superpower stations and systems, and the desire of the electric light and power industry to engage in a progressive and far-reaching program of expansion, one is naturally surprised that the number of superpower stations in existence is not larger. Certainly it is not for want of vision on the part of the industry, nor yet for want of load. Our companies have great difficulty even in normal times to keep abreast of demands for service, and they are erecting and will erect superpower stations just so fast as financial and economic conditions warrant and handicaps are brushed aside. It is a matter of great national interest, however, whether the billions of horsepower-hours produced in this country shall be produced at an expenditure of six pounds of coal per horsepower-hour in a small plant or one pound of coal in a superpower station. It is also a matter of public concern whether we shall continue to be prodigal in the utilization of our fuel resources and at the same time permit our water powers to run to waste.

### LEGAL DIFFICULTIES

According to the second annual report of the Federal Power Commission, applications have been made for licenses for the development of an aggregate of 20,000,000 hp. on lands over which the federal government has jurisdiction. This is twice the water power which has been developed in the United States to date and is from five to six times greater than the aggregate of all applications filed with the federal government since hydro-electric development became an art. Obviously the inclination and desire to develop water power in this country has not been lacking; the right to do so under reasonable legislation has only just been granted.

Now, the source of half the power represented by the applications in the hands of the Federal Power Commission is found in three rivers, the St. Lawrence, the Colorado and the Columbia, and every one of these streams is at present involved in legal entanglements. The St. Lawrence, for instance, is an international boundary stream, and until a treaty with reference to its greater canalization and control is negotiated between the United States and Canada no American water-power projects of any magnitude can be undertaken.

The Colorado River is involved by a compact signed in Santa Fé, N. M., last November. This compact must be ratified by the seven interested states—all but Arizona have already signed—and then by the National Government. The treaty between the states allocates the water of the Colorado between the geographical divisions and provides for flood control, irrigation and power development. Thus far the Federal Power Commission has taken no final action on the applications involving this stream, and it is not likely to do so until some unity of action is agreed on by the States of California, New Mexico, Nevada, Utah, Wyoming, Colorado and Arizona.

The Columbia River has been under investigation by a special board to determine the relation between water power, irrigation and navigation, and for these reasons action on almost all the projects on that river has been suspended for the time being.

To cap the climax, the State of New York has brought suit in the United States Supreme Court to have the federal water power act of 1920 and the activities of the

*Part of an address made before the Pittsburgh convention of the A. I. E. E., April 25, 1923.

Federal Power Commission thereunder declared unconstitutional. Already Pennsylvania and seven Western states have announced that they will fight the suit, and it is not unlikely that in the end as many as forty states may appear against New York. Annulment of the federal water-power act would produce a chaotic situation in Western states, where much hydro-electric development has begun under it, and would open the way to further selfish state discrimination such as now obtains in the State of Maine. Until, therefore, the federal law is upheld by the United States Supreme Court, all permits issued by the Federal Power Commission are under a cloud, and because of that fact very little money will be available for water-power development. It is just as difficult to sell bonds on a hydro-electric property thus encumbered as it is to raise a mortgage on real estate the title to which is not clear. Other superpower streams, like the Delaware, also are involved in legal controversies, and until these are settled many hydro-electric superpower projects will be effectually checked.

It will be recalled that the United States Geological Survey made an exhaustive study of the Boston-to-Washington power zone and brought to light the enormous economies procurable through a proper co-ordination of steam and water-power resources in the district. Were it merely a matter of engineering, the recommendations of W. S. Murray and the other engineers who made the survey would now be carried out; but legal and financial difficulties are not easily disposed of. As it is, the plans laid down in that report are already being carried out in part through the natural evolution of the business.

The electric light and power companies are not pessimistic over the outlook. On the contrary, they are going right ahead with characteristic enthusiasm and optimism, building huge stations here and extending transmission lines there in spite of handicaps. The road is not strewn with roses, however, nor do the handicaps always go down before a frontal attack. More often they necessitate a long siege.

## National Aspects of Superpower Supply

Manifestly, if we are to maintain the high standard of living which is characteristic of America, the per capita earnings of the country must also be high. The United States, through its great use of machinery and electricity, is able to maintain a higher standard of living than any other country because its labor produces more and earns more. During the twenty years prior to the war, the annual national per capita earnings in the United States increased 116 per cent, those of Germany 52 per cent, France 27 per cent, and Great Britain 21 per cent.

These percentages reveal much. They show what an enormous influence cheap power, which means electricity, has on the productive capacity of a nation and people, and it is chiefly because they are such great users of electricity that Americans excel in so many directions. But if we are to continue to enjoy an abundant and cheap supply of power, we must concentrate more and more in its production; we must erect fewer but larger stations; we must develop our water powers, conserve our fuel resources and through interconnected networks of transmission lines make power available in every market.

Thus the water power of the Sierras will be the mainstay of industry on the Pacific Coast; the Rockies will provide sufficient power for local needs and large blocks of energy ought to find their way into the prairie states far to the east; the Middle Atlantic and New England States must look for hydro-electric developments on the Niagara and St. Lawrence Rivers to augment their supply of energy, the watersheds of the Southern Appalachian range ought to provide additional power for the states bordering on the Ohio River in addition to meeting the fast-growing needs of the South.

## Economic Advantages of Water Power

There are in existence numerous examples of electric superpower stations and systems which have not only justified the faith which the electrical industry has in them but have also proved their value to the nation and to its industrial development. A romance could be written around the use of hydro-electric energy by the electrochemical industry at Niagara Falls, and one of the most interesting chapters could be devoted to tracing the use of those electrochemical products manufactured through the instrumentality of cheap electricity in the thousand and one essential industries scattered throughout the country. It would be vain to dilate on the application of electricity in California and what hydro-electric development means to it. It is an open book, and the story can best be told by a citizen of that state.

The Montana Power Company furnishes 85 per cent or more of all the electricity used in the State of Montana. This energy is derived from numerous hydro-electric stations which are interconnected and which feed high-tension transmission lines traversing the greater part of the State. The mining and production of copper is the chief industry of Montana. Before the present hydro-electric stations on the Missouri River were built the mines of Butte and the smelters of Anaconda were depending on steam power to the extent of 35,000 hp., and it was costing them on an average $85 a horsepower-year. Hydro-electric energy was transmitted into the district from Great Falls, 130 miles away, and sold to the mines at $30 a horsepower-year. In other words, the mining companies were enabled to carry on their operations for $2,000,000 less money a year than it cost before. But the most significant fact of all is that this cheap electric power made it commercially porfitable to refine and reclaim tens of millions of tons of low-grade copper ore that otherwise would have had to be passed by—and the United States is the largest producer of copper in the world.

The question of transportation is one of the most active in the national mind today, and in its solution the electric light and power companies will play a most prominent part. As indicative of the savings which electrification makes possible, the case of the Chicago, Milwaukee & St. Paul Railway, which receives electricity for operating its transcontinental line from central-station sources, may be cited. At the time the Milwaukee road was electrified a long-term contract was made with the Montana Power Company for power to be delivered over 450 miles of the road. The cost of the electricity was something like $550,000 a year, whereas, although the Milwaukee railroad furnished its own coal from its own mines and one-third of its equipment was used in hauling the coal, the cost of the coal to operate the steam trains over the same section that was afterward electrified was approximately $1,750,000 a year. The same power company provides electricity for the Butte, Anaconda & Pacific Railroad Company at the same price and practically under the same conditions as it does to the Chicago, Milwaukee & St. Paul Railway Company. The cost of electrical energy

for the Butte, Anaconda & Pacific Railroad Company a year after its electrification was $8,000 a month, whereas it formerly cost the railroad $22,500 a month for coal alone.

Aside from the advantage which accrues to every shipper over these railroads owing to the more dependable and cheaper electric power, such an arrangement possesses other marked advantages. It saves coal in the ground and utilizes an absolutely waste product—water power—which until recently was permitted to flow unmolested to the sea. It also contributes not a little to the growth of the state because it enables industry to locate in the territory and assures it of low-priced power anywhere along the line of the railroad.

The acquisition of a large amount of railroad load is especially beneficial to electric public utilities in that it makes for cheaper operation in direct proportion to the volume and diversity of the business, and this in turn means cheaper money and lower rates to the consumer. It is the experience of every public utility operator that under regulation the only way to be successful is to follow the modern plan of big volume and small margin. For purely economic reasons little plants and distributing systems and little companies in the electric public utility field have gone forever. Even in the case of the great steam-railroad systems of the country, traversing as they do many states, it has been found that the best interests of the public as well as the railroads lies in still greater consolidation of railroad groups under a single management.

### CIVILIZATION AND SUPERPOWER

Superpower is a measure of advancing civilization. It is machinery raised to the *n*th degree, superseding municipal and state boundaries and becoming national and continental in its character. It can find no abiding place in countries where life is primitive and labor cheap. A superpower system in China or India, for instance, would manifestly be a wild extravagance. The simpler manufacturing processes, the only ones that are performed in primitive countries, are in those lands more economically carried on by man power than they could be through the use of electrical energy, even at a rate that will barely pay interest on the cost of setting up the generators and building the transmission lines. But, as civilization grows in backward nations, the demand for machinery will grow, and a time may come when progress will not only bring with it the multiplication of steam and hydro-electric stations, but will cause their energy to be carried for scores or hundreds of miles to supply light, heat and power to every district and to turn the wheels of innumerable factories.

In America that day has already come. Electricity is demanded in ever-increasing quantity. Kilowatt-hour output grows by leaps and bounds. It is becoming a matter of common knowledge that to build a central station in every little town is as wasteful as it was to install a plant in every building. The individual plants once so numerous will soon be almost things of the past. So, too, will the small central stations, disadvantageously situated, disappear as the economy of service from greater stations, built near mines or on water-power sites, becomes more and more apparent. Interconnection, already a proved boon to consumers in economy of rates and reliability of service, will extend until the isolated system becomes a rarity, and over all parts of the land networks will be built offering power to every user at a rate relatively far less than he would otherwise pay.

# Letters from Our Readers

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

## Relays on the West Penn System

*To the Editors of the* ELECTRICAL WORLD:

In the May 5 issue of the ELECTRICAL WORLD, in the report of the A. I. E. E. convention in Pittsburgh, page 1029, the report of my remarks in the discussion on relays is slightly in error in other ways besides the prefix of wrong initials to my name. I am made to say that the voltage-restraining relay scheme on the West Penn system was discontinued on account of the purchase of properties equipped with other relay schemes. This is not correct. The reason for discontinuing the relay was the growth of the system, involving additional generating plants and a multiplicity of loop connections. It is further stated that I advocated test of all relays in the laboratory before installation, but this is not the case. My statement was to the effect that many companies are adopting this scheme of laboratory test before installation, whereas out of a total of approximately 600 relays installed within the last two years not more than ten have been in our laboratory, and that our present program allows the relays to be shipped direct from the factory to the job, where they are installed on panels and tested in place.

H. A. P. LANGSTAFF,
Relay Engineer.

West Penn Power Company,
Pittsburgh, Pa.

## Transmission Towers

*To the Editors of the* ELECTRICAL WORLD:

Your editorial of May 19 commenting on the diversity of tower design is extremely pertinent. It can hardly be possible, however, to standardize designs when there is no universal acceptance of loading conditions. The most important of the various test loads, that corresponding to one or more broken wires, is variously estimated by different engineers as equal to (a) the maximum wire tension plus 35 per cent for safety factor and allowance for impact, or (b) the maximum wire tension, or (c) the maximum wire tension less 30 per cent to allow for the reduction in stress when the insulator string swings into line with the wire, or (d) 3,000 lb., being the maximum load which the suspension clamp will carry before it slips.

If a wire is strung for a maximum tension for 5,000 lb., then the broken-wire load on the cross-arm may be variously estimated as (a) 6,750 lb., (b) 5,000 lb., (c) 3,500 lb., or (d) 3,000 lb.

For strain and anchor points (c) and (d) do not apply, but for suspension towers each and every one of the above assumptions is used in different locations, according to the opinion of the engineer concerned. Obviously they cannot all be right, and either the towers are far too heavy with assumption (a) or far too light for condition (d).

With the present widespread use of heavy conductors, especially of steel-cored aluminum, strung with a maximum tension of between 5,000 lb. and 8,000 lb., a more uniform and satisfactory method of estimating the broken-wire load is called for. ERNEST V. PANNELL.

New York, N. Y.

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Testing Transformer Polarities

THE proper connection of instruments and relays with potential and current transformers necessitates polarity marks on the primary and secondary side of transformers. This applies to distribution transformers also, aiding the linemen to make proper connections.

Manufacturers as a rule check the instrument transformers and mark the proper polarity at primary and secondary terminals. This work is often checked by the purchaser, and in case of errors the mistakes are corrected. Distribution transformers are often supplied with the statement of "subtractive polarity," and if polarity marks are preferred a proper check is necessary to prevent any mistakes in marking.

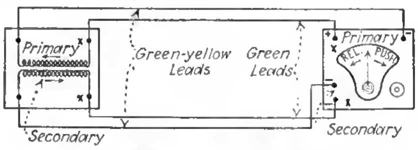
In order to check up polarities of transformers by a simple and quick method an instrument was constructed by the writer which consists of a 3-0-3-volt differential voltmeter to be connected across the secondary terminals of the transformer under test. A battery of three ordinary dry cells in series is connected to the primary terminals of the transformer with a push-button making and breaking the current contact.

The instrument with batteries, terminals with polarity marks, push-button and leads is mounted in a wooden box. Its weight complete is 18 lb., and the dimensions are 11 in. x 9 in. x 7½ in.

The instrument shown in the illustration is not a standard instrument, on account of its 3-0-3-volt scale. However, it is not necessary to have this scale range. Any scale up to 10 volts can be used, but for a larger scale higher-battery voltage is necessary, thus increasing the size and weight of the apparatus.

An instruction sheet placed in the cover of the testing apparatus gives the operations to check polarity. These instructions are given below the accompanying diagram. The different-colored leads are used to simplify the hook-up and to prevent any mistakes being made by the inspectors. An approximate cost list of materials is given in the accompanying table.

East Orange, N. J. E. J. MOMMO.



APPARATUS FOR DETERMINING POLARITY OF TRANSFORMERS

Connect green leads to the terminals with polarity marks and green-yellow leads to remaining terminals of test set. Connect the leads from primary terminals of set to the high-potential side of transformer, and from secondary to the low-potential side of transformer. Push the button; deflection should be low and to right-hand side of scale. After the pointer returns to zero release the button; deflection should be high and to left-hand side of scale. Then the polarity marks should go to the terminals of the transformer, where the green (polarity) leads are connected. If the deflections are reversed as compared with the above, reverse either primary or secondary leads at transformer terminals and repeat the operation. In cases where the deflections are too small, connect primary terminals of set to the low-voltage side of transformer and secondary terminals of set to the high-voltage side of transformer.

PRICE OF MATERIALS USED IN POLARITY TESTING SET

| Bill of Material | Price |
|---|---|
| One box, with hinges, etc. | $5.00 |
| Three dry cells, at 45 cents. | 1.35 |
| Four binding posts, at 10 cents | 0.40 |
| Four name plates (primary, secondary and two blanks) | 0.16 |
| One carrying handle | 0.50 |
| 25 ft. lamp cord at 3 cents. | 0.75 |
| One differential-scale voltmeter, 3-0-3 volts | 15.00 to 30.00 |
| One bakelite panel, 8½ in. x 7 in. x $\frac{3}{16}$ in. | 1.80 |
| Total cost | $24.96 to $39.96 |

## Foundry Flasks Repaired by Arc Welding

ONE of the most recent applications of arc welding in foundry practice is that of repairing worn flasks. This operation is proving to be such a success and to bring about so marked a saving that all foundry superintendents should learn how to take advantage of the process to help reduce their foundry expenses.

After use, the malleable iron lugs of the flasks become worn to such an extent that the pin on the other half of a flask will not fit in it tightly enough to hold the parts in alignment. The method of making repairs in the past was to ream out the hole to a diameter of ⅞ in. and then press in a bushing having a ⅝-in. hole. When the bushing wore too large it was replaced with a new bushing.

The new method of repair, however, is even less expensive and much more satisfactory. The practice is to ream out the hole to ⅞ in. diameter and then fill the hole completely, using the metallic electrode arc-welding process. A piece of copper is placed under the hole and the welding is done, using about 175 amp. and a $\frac{5}{32}$-in. welding wire. The time required to weld one hole is about three minutes. When these holes are again worn too large it is not necessary to ream them out before the welding operation. The time required to weld a hole is then reduced to about two minutes.

The cost of welding each hole as originally drilled to ⅞-in. diameter is about as follows:

| | |
|---|---|
| Labor, at 70 cents per hour | $0.035 |
| Welding wire, at 8 cents per pound | 0.016 |
| Electric power, at 3 cents per kw.-hr. | 0.013 |
| Total | $0 064 |

A question naturally arises as to why it is necessary to drill a ⅞-in. hole in the casting when only a ⅝-in. hole is required. The reason for this is that there will be a layer of very hard chilled high-carbon cast steel about $\frac{1}{16}$ in. thick in the region where the deposited metal unites with the casting; therefore it is necessary to

have the original hole ¼ in. larger than the final hole so that no difficulty will be experienced in drilling the final hole through the deposited metal.

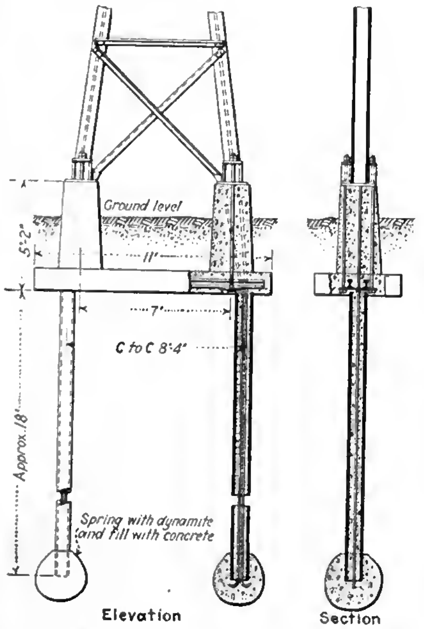
A. M. CANDY,

General Engineering Department.
Westinghouse Electric & Manufacturing Company,
East Pittsburgh, Pa.

## Steel Towers Illustrate Interesting Design

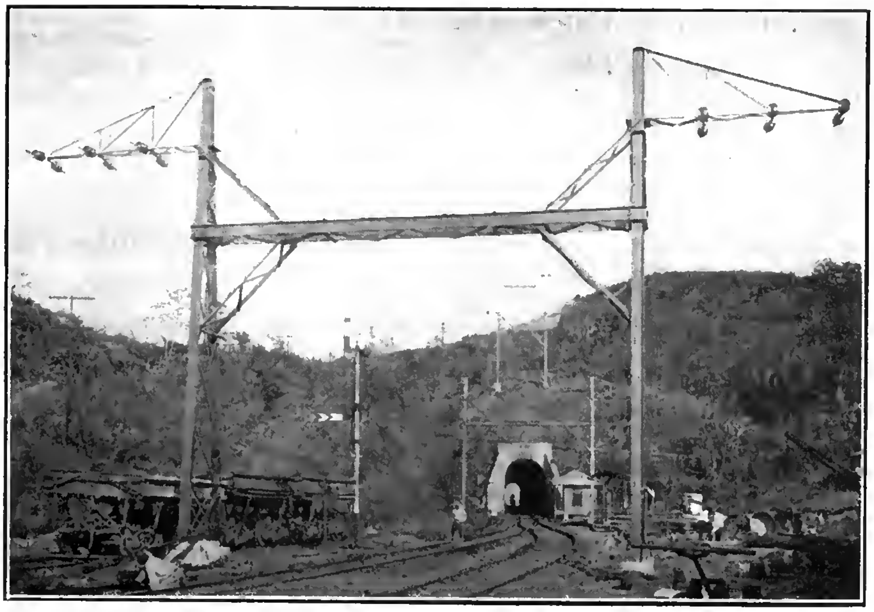
AN ANCHORAGE for transmission-line towers described by A. W. Malone in the ELECTRICAL WORLD of March 3, 1923, page 524, recalls a similar design used ten years ago by the Isthmian Canal Commission in the construction of a 44,000-volt transmission line for the Panama Canal. Mr. Malone's anchorage for transmission line towers consists of a drilled hole with a dynamite-sprung bottom, filled with concrete embedding a steel anchorage.

The Panama Canal transmission line on which the dynamite-sprung anchorage was used is shown in the two accompanying illustrations. The transmission line and its anchorage were described rather completely in the *Canal Record* of July 9, 1913. About 800 towers were erected, and the anchorages aggregated more than 3,200.



RESISTANCE TO OVERTURNING INCREASED BY THIS CONSTRUCTION

The transmission-line tower of the Panama Canal is essentially a track-span structure that provides for the support of a three-phase circuit on bracket arms at each side, with a ground wire at the apex of each side frame. Provision was made in the design for a possible future installation of compound-catenary trolley wires.



DOUBLE TRACK SPANNED BY TRANSMISSION TOWER CONSTRUCTION

The foundation under each of the side frames consists of two concrete pedestals cast upon a slab with a 4-ft. x 11-ft. base, 1 ft. thick. The base slab, which is reinforced longitudinally with used steel rails, provides the necessary foundation area for the worst assumed condition of broken conductors, and the weight of the backfill on top of the slab provides to a certain extent for the overturning moment.

Additional resistance to overturning is secured in the dynamite-sprung anchorage, which for each slab consists of two 8-in. holes, bored with a well drill to a depth of about 18 ft. The bottoms of these holes were sprung in exactly the same manner that drilled holes were sprung on the canal excavation work, to provide sufficient space for large dynamite charges. Steel-reinforcing rods having ends bent over at the bottom were inserted down the drilled hole, reaching to the bottom of the cavity, which with the 8-in. hole was solidly filled with a rich concrete mixture, well tamped.

The concrete ball at the bottom of the anchorage, when called upon to function in resisting overturning of the tower, bears directly on virgin earth (or shattered rock if the hole is drilled in rock), instead of bearing on the backfill of the customary transmission-line footings.

## Cost of Transformers

AN EASTERN central station company located about 200 miles from the factory which supplied the equipment tabulated the cost of its distribution transformers purchased during 1922, and from these data the accompanying table has been prepared showing the cost per kva. at the factory for the different sizes purchased. All were 60-cycle designs. The cost of some miscellaneous equipment is also included.

TABULAR ANALYSIS OF 1922 DISTRIBUTION TRANSFORMER PURCHASES

| Rating, Kva. | Voltage Ratio | No. | Price: Total | Price: Per Kva. |
|---|---|---|---|---|
| 0.5 | 2,200/122/244 | 3 | $99.84 | $66.50 |
| 1.5 | 2,200/122/244 | 22 | 735.36 | 22.20 |
| 3 | 2,200/122/244 | 27 | 1,291.68 | 15.90 |
| 5 | 2,200/122/244 | 24 | 1,547.52 | 12.90 |
| 7.5 | 2,200/122/244 | 9 | 758.16 | 11.20 |
| 10 | 2,200/122/244 | 14 | 1,434.16 | 10.25 |
| 15 | 2,200/122/244 | 39 | 5,313.36 | 9.10 |
| 5 | 2,200/608 | 3 | 193.44 | 12.90 |
| 10 | 2,200/608 | 6 | 614.64 | 10.20 |
| 15 | 2,200/608 | 12 | 1,634.88 | 9.10 |
| 25 | ...... | 3 | 592.80 | 7.90 |
| 50 | 2,200/608 | 3 | 976.56 | 6.50 |
| 100 | 2,200/608 | 2 | 979.63 | 4.90 |
| 100 | 13,800/600/2,400 | 3 | 1,950.00 | 6.50 |
| 1.5 | 575/115/230 | 1 | 36.48 | 24.30 |

## Boiler Settings Patched to Prolong Life

THE life of boiler settings can be prolonged by carefully patching when the opportunity affords. More serious repairs may be saved if small cracks or open joints are attended to before the brick or tile becomes loose. Success in the work depends on the method of application as well as the materials used. The method used in patching the boiler of a large company in the Middle West has given very good results.

In this method the clinker was first removed and the surface chipped and nicked until most of the glaze was gone and the original texture of the brick exposed. Care was taken in this work so that the bricks would not loosen. Then the entire surface to be patched was brushed until free from dust. This surface was then well saturated with a thin milky wash of "hytempite," which was quickly absorbed by the exposed brick surface. The foundation for the patch, consisting of a somewhat thicker mixture, was then applied as a bonding coat. Where the surfaces were large this was done in sections so as to insure a moist surface for applying the patching mixture. The patching material consisted of diluted hytempite to which carbosand was added gradually until thoroughly mixed. The consistency was such that no free moisture showed when the mixture was squeezed in the hand. Care was taken to apply the patch while the foundation coat was still moist. The dark portions of the patching as seen in the background of the illustration show the method of applying the patch to a large surface by plastering on a small section at a time.

After the patching was completed on all large and small surfaces it was allowed to set for about an hour before applying a final surfacing of the same mixture as used for the bonding coat. The object of the final coating was to fill pores and small voids and give a smooth surface that would resist pitting action of flames and hot gases.

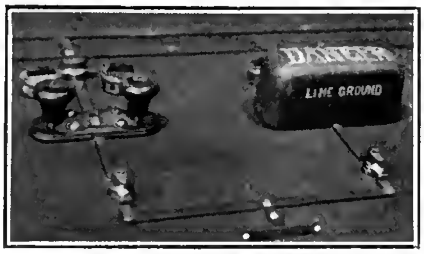
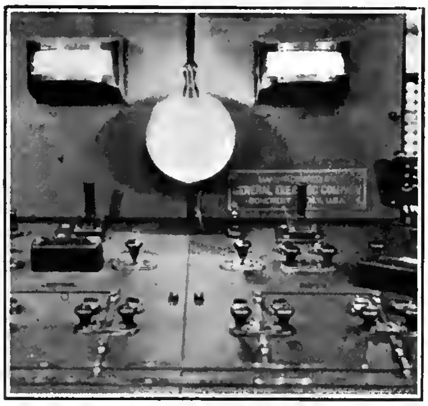
PATCHING MATERIAL APPLIED TO BOILER SETTING AVOIDS MORE SERIOUS REPAIRS

## Guards on Switchboard Prevent Mistakes

ON MODERN power-plant switchboards it is necessary to take some precaution to prevent accidental or thoughtless closing of high-tension switches that have been opened for making repairs on equipment or for other reasons. This is generally done by tagging the switch in some manner, but the operators at Big Creek No. 1 power house of the Southern California Edison Company use the wooden block shown in the accompanying illustration for this purpose. Two holes are drilled in a wooden block, which is then chiseled out so it will fit over the oil-switch control knobs on the switchboard. On the top of the block is the word "Danger," on one side is "Line ground," meaning that the line is grounded at the station, and on the other side is "Men working." An operator would certainly have to be very careless or in a bad state of coma to remove this guard and close the oil switch without stopping to think whether everything was clear.



SIMPLE GUARD PREVENTS CARELESS CLOSING OF OIL SWITCH



GENERATOR FIELD SWITCHES PROTECTED AGAINST ACCIDENTAL OPENING

Similar guards are used to protect the oil switch-control buttons on the generator field switches. The turbine governor-control switch is located right alongside the field switch-opening button. The governor switch requires frequent manipulation, and if an operator should carelessly pull the field-switch button instead of the governor-control button, the generator field switch would be opened and serious damage might result. G. C. HECKMAN,

Superintendent Electrical Construction,
Southern California Edison Company,
Big Creek, Cal.

## Venting of Transformers Direct to Air

IN the ELECTRICAL WORLD for March 31, page 753, there was an article regarding the experience of a Southern power company which operates its transformers with open air vents to encourage the circulation of air above the oil level, the idea being to sweep out the oil vapors. We have taken samples of oil from the transformers to which you refer and this oil has shown excellent color and dielectric characteristics. However, we believe that the company's success with this method of ventilation is due to the fact that its transformers are all operated at low temperature. It is

well known that the oxidation which occurs at temperatures usually encountered in power transformers is much reduced at abnormally low temperatures.

However, if the oil temperatures were as high as usual in power transformers, the sludging and deterioration of the oil would most certainly be accelerated by the circulation of air over the oil level. We should be interested to know by what theory the oil could possibly be kept in better condition through contact with air than by isolation from air.

# Extracts from an Operating Code

BY FIELD EDITOR ELECTRICAL WORLD
New York, N. Y.

## How to Remove Scale from Evaporator Coils

"CRACKING down" of the evaporator effects is to remove the scale which is deposited on the coils. The rapid expansion of the metal of the coils, due to the sudden changes of temperature obtained, will crack the scale from the tubes. The specific instructions for cracking down evaporators as abstracted from the operating code of the Philadelphia Electric Company are given below:

CRACKING DOWN EVAPORATORS—FIRST EFFECT

1. Close the hand valve on the automatic feed-water valve control.
2. Close the steam valve to the coil and blow down the first-effect evaporator shell completely through the blow-down meter.
3. Close the blow-down valve.
4. Open the vent valve.
5. Fill the first-effect evaporator with cold filtered river water to the top of the gage glass.
6. Close the vent valve.
7. Close the vapor valve on the first effect.
8. Open the steam valve on the first-effect coil suddenly.
9. Close the steam valve when the cracking ceases and see that the pressure does not exceed 15 lb. or 20 lb. in the shell.
10. Blow down the shell to the discharge tunnel, completely.
11. Close the blow-down valve.
12. Open the hand valve on the automatic feed-water valve control.
13. See that the shell fills the hot water to the normal running level.

SECOND EFFECT

1. Close the hand valve on the automatic feed-water valve control.
2. Close the vapor valve on the second effect.
3. Open the vent on the low-pressure shell.
4. Blow down the shell completely through the blow-down meter.
5. Close the blown valve.
6. Fill the second-effect evaporator with cold filtered river water to the top of the gage glass.
7. Close the vent valve.
8. Admit steam suddenly to the second-effect coils through the steam line connected to the vapor line. Do not exceed 60 lb. pressure.
9. Close the steam valve when the cracking ceases and see that the pressure does not exceed 5 lb. on the shell.
10. Blow down the shell to the discharge tunnel, completely.
11. Close the blow-down valve.
12. Open the hand valve on the automatic feed-water valve control.
13. See that the shell fills with hot water to the normal running level.

FIRST AND SECOND EFFECTS

1. Open the vapor valves.
2. Proceed to put in operation according to rules for "Putting an Evaporator Into Service" given in the last issue of the ELECTRICAL WORLD.

## Correcting Reversed Polarity on D. C. Generators

FOUR methods for correcting reversed polarity of direct-current generators are given in the operating code of the Philadelphia Electric Company. The first method is applicable only to compound-wound generators which can be paralleled with one or more compound-wound generators of correct polarity carrying load. The equalizer switches of these machines, when closed, connect the inner terminals of the series field windings of two or more generators in parallel, equalizing the potential at these points and thereby causing proper division of the total load current among the series-field windings. When the equalizer switches of all the machines in operation are closed and when the equalizer switch and the bus switch on the same side of the reversed machine are also closed, the series field of the reversed machine is placed in parallel with those of the machines in operation and so takes its normal share of the total load current. The current in the series field of the reversed machine is in the same direction as the normal operating current and thus tends to build up a field of proper polarity; if strong enough to overcome the residual magnetism, it will reverse the polarity to normal.

If this method fails to reverse the polarity, the method about to be described should be used. This method applies to shunt-wound or compound-wound generators when the bus can be energized from a source of correct polarity. By this method, with the positive machine switch open and the positive shunt-field lead connected to the positive bus, current flows through the shunt field circuit, but not through the armature when the negative and circuit breaker and negative machine switch are closed. This develops a field of correct polarity in the field circuit, and when the machine is shut down the residual magnetism will be of correct polarity. Therefore, when the machine is again started up, it will build up with correct polarity.

When no source of correct polarity is available, a third method known as "flashing" may be used. In this case the shunt-field leads are reversed and the circuit through the shunt field is closed for an instant while in this reversed condition. This causes a wave of current to flow through the shunt-field circuit in the normal direction and of sufficient strength to reverse the existing residual magnetism. If the machine is then started up normally, the field will build up with correct polarity.

The fourth method is applicable to motor-generators which can be started from the direct-current end. This method is based on the fact that a shunt-wound or compound-wound generator of given polarity must be supplied with current of the same polarity in order to operate as a motor in the same direction. When current of normal polarity is supplied to such a machine, it reestablishes the normal polarity of the field and, consequently, that of the generator.

# Radio Communication Being Developed in the West

THAT radio communication is rapidly being adopted by Western power companies as a means of maintaining communication with their distant power plants during times when wire lines are inoperative was a feature brought out at the recent meeting of the sub-committees of the Technical Section of the Pacific Coast Electrical Association.

The Great Western Power Company is now using a carrier radio-telephone system between its Caribou plant and its receiving substation in

Oakland, a distance of 156 miles. This system is used for all dispatching and has been in successful operation for several months. The Pacific Gas & Electric Company is installing a similar system between its Pit River No. 1 plant and Vaca substation for operation over 200 miles of 220-kv. transmission line.

The Southern California Edison Company is using continuous wave wireless telegraph as the only means of communication between its main field office at Big Creek and its five construction camps in the upper Sierras. A total of 300,000 words a month are handled between these stations. This company is also experimenting with carrier radio telephone with a view to utilizing it as a means of communication between its Big Creek plants and the dispatcher in Los Angeles, a distance of 240 miles over its two 220-kv. Big Creek transmission lines. Carrier radio telephone seems to be generally favored where it is possible to utilize a transmission line running in a direct route between the two stations it is desired to keep in communication with each other.

On account of the character of the transmission system of the San Joaquin Light & Power Corporation conditions are not favorable for carrier radio, and it is experimenting with straight radio telephone. While carrier radio is working successfully in many cases, it is felt that a number of improvements will have to be made before it can be absolutely relied upon under all operating conditions.

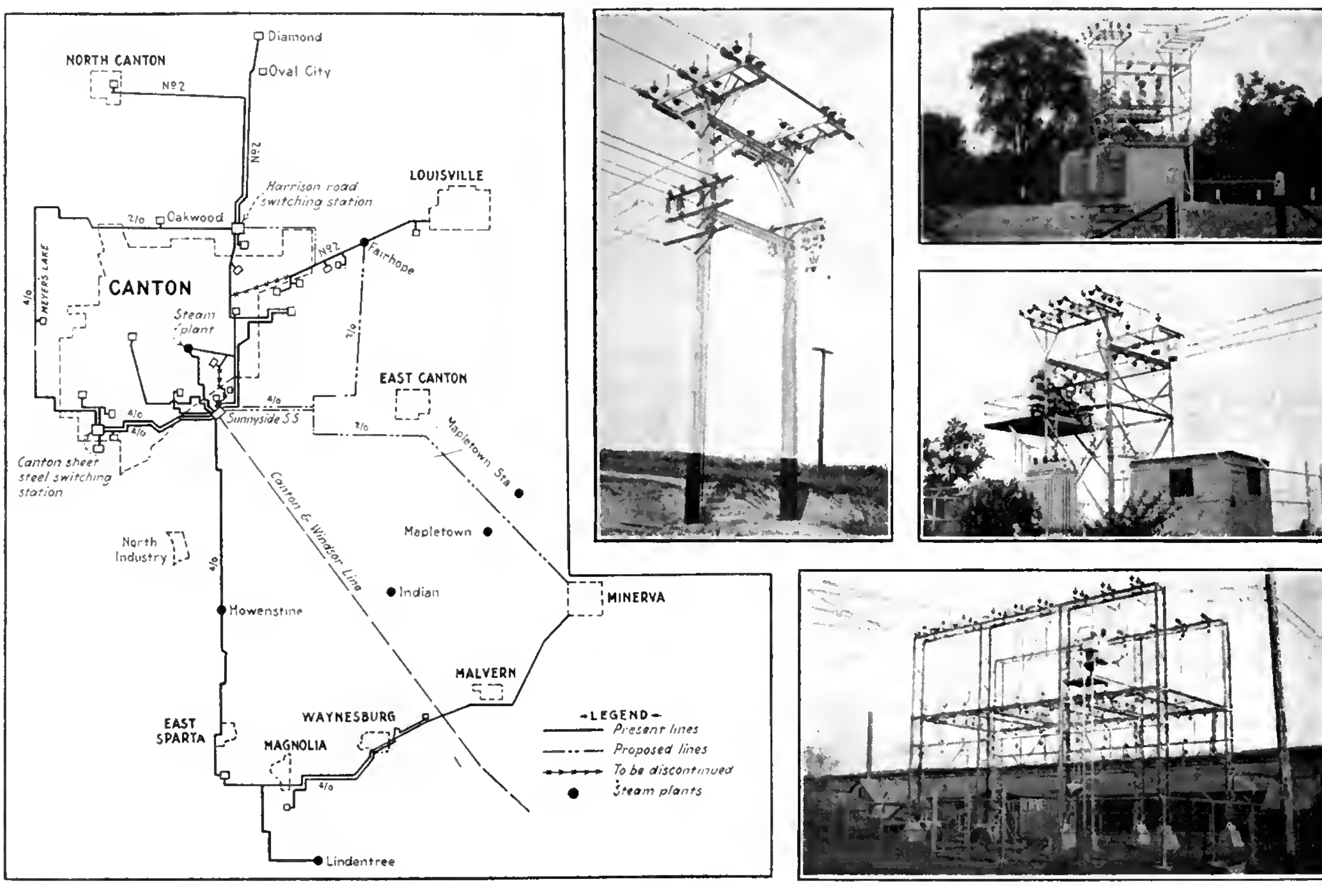
## Belt-Line System Solves Distribution Problem

THE Ohio Power Company at Canton, Ohio, has had a very large increase in load during the past few years. This growth of business made its distribution problem complicated. The situation was met by building a 22,000-volt wooden-pole belt line around the city with transforming and switching stations at intervals. The line is complete with the exception of the south link, which will tie the Bryan Avenue switching station to the station at sunnyside, the terminus of the 130-kv. line from Windsor. The line is built on wooden-poles with No. 4/0 wire. The Harrisburg switching station is used as a sectionalizing point and controls the tie line to Sunnyside and feeders to heavy industrial loads. The Oakwood substation will distribute at 4,000 volts to a district two miles distant. Meyer's Lake station will supply a section two miles each way at 4,000 volts, while the Bryan Avenue station will control the south tie to Sunnyside and the west section of the belt line and in addition some heavy industrial feeders.



DISTRIBUTION PROBLEM SIMPLIFIED IN CANTON, OHIO, BY 22,000-VOLT TRANSMISSION BELT AROUND CITY

Left—General layout of transforming and switching stations. Upper right and right center—East Sparta and 750-kva. Oakland substations, typifying type of construction employed. Right bottom—Bryan Avenue switching station, terminus of 130-kv. line from Windsor. Top center—Oakland sectionalizing station.

At each switching station the incoming 22,000-volt lines go to a high-tension outdoor structure equipped with air-break switches, oxide-film arresters, etc., and thence to outdoor transformers. The secondary leads enter a concrete or brick switch house at 4,000 volts. In this switch house meters, relays, breakers and low-tension buses are installed. Underground construction is used from switch house to secondaries.

# Central Station Business

**Advertising, Selling and Service Methods**
**Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences**

## Should Central Stations Merchandise?*

**Considered from the Consumer's and Central Station's Viewpoint—Where a Utility Works with Dealers Experience Shows More Active Local Interest in Appliances**

By A. W. Krueger
Edison Electric Appliance Company, Chicago

SHOULD the central-station company sell appliances? Our experience permits only one answer: "Yes—most emphatically." Everybody benefits through central-station appliance selling activity. The reasons for this are readily apparent.

Let us take the consumer. Not nearly the number of women today would know of and enjoy the benefits of electrical household devices had central stations remained inactive or indifferent to their educational responsibilities. Most of them would still be pushing a broom over their carpets instead of using a vacuum cleaner and realizing its tremendous labor saving. In most cases they would still be turning a flywheel on the family washing machine. They would not be enjoying the advantages of electrical cookery and many other similar benefits.

This one constructive factor in itself is sufficient reason for the central station to merchandise appliances, because by so helping their customers they render a real service as a public utility through bringing the public to a realization that electrical service only starts with lighting. Helping to educate the public, the central station benefits not merely through good will but very materially in dollars and cents because of increasing the energy day load, most of which is consumed at the lighting rate. In addition, nearly all central stations which sell appliances today are receiving from their commercial departments a merchandising profit.

The story of these benefits does not stop here. The widespread public acceptance of electrical appliances has automatically created thousands of electrical appliance dealers. They effectively supplement central-station activity. Their success means additional central-station day-load revenue. They are a valuable asset in broadening the appliance field and are well worth the c'osest cultivation and co-operation.

### Merchandising Progress Gradual

In the early days of central-station merchandising thousands of flatirons were distributed at cost. In a great many cases they were actually given away. It was good business then because the increased day load more than offset the expense involved. The public began to realize the labor-saving advantages of electrical household devices. They began to appreciate that electrical service meant something beyond lighting bulbs. This, however, was not conducive to dealer expansion, for they could not compete. The practice was relatively short-lived because it was soon found that the public responded to intensive campaigning and people were ready and willing to pay reasonable prices for electrical conveniences. Central stations abandoned the earlier plan of no merchandising profit and put their individual commercial department on a profit-producing basis. They realized the advantage to themselves as well as to the dealer of the active co-operation of all electrical appliance-selling outlets, such as electric specialty shops, hardware stores, department stores and electrical contractors—in fact, every legitimate merchandising outlet for household devices. Manufacturers' suggested list prices were maintained, and an extremely healthy condition resulted—a condition that holds true today in virtually all communities.

It is unfortunate that there are today some dealers who still carry the point of view that the game is one-sided in favor of central stations. They have not stopped to analyze the facts of the case. A great deal of progress has been made in educating the dealer and making him a better merchant, but there is still room for a lot more good work that can be promoted by the central station to produce more harmonious relations between these branches of the industry.

George A. Hughes once declared: "Show me an inactive central station and I will show you a dead appliance town." This statement clearly defines the facts. Consider a concrete case, that of a busy Mid-Western city with a population of 250,000 inhabitants. Up to a few years ago the policy of the local utility was to sell energy and lamps only. "Leave it to the dealer," was its motto. Did the dealers appreciate this situation? Did they get busy and make the most of their opportunity? Did they advertise on billboards? Advertise in the newspapers? Conduct demonstrations? Circularize their mailing list? Did they ever make an appliance analysis of the town? Not so you could notice it! They sat back and wondered why their appliance business was not better.

### Utility a Gage of Activity

The central station in question finally came to a realization of this condition. It decided to get busy and to become an active merchandiser and it believed in "doing the job up brown." A location was secured in the heart of the shopping district. No expense was spared in fitting out the display room as the outstanding appliance showplace of the city. Neither was any money spared in widely advertising that fact. A tremendous howl went up from the dealers. Appliance business was going to be ruined! The central station would wreck the whole merchandising works. It would kill what little had been accomplished.

What actually happened? The town just began to wake up to the value of appliances. Nobody had ever taken the trouble to tell it the

*An abstract of a paper presented before the Commercial Section, Indiana Electric Light Association, Indianapolis, May 3, 1923.

real story before. The central station used billboards, newspapers, sales letters, attractive windows and freely advertised the appliance shop. The public's interest was aroused. People were soon thoroughly "sold" on the electrical household idea. Appliance sales increased by leaps and bounds. Dealers who had bitterly fought the movement sold more appliances than they ever dreamed was possible. Department stores opened special electrical departments. Electrical specialty shops with high-grade equipment and merchandise sprang into being. Hardware stores got busy. Everybody was benefited. Even the dealers admitted that. Had the central-station company not changed from a passive to an aggressive merchandising policy, that city today would still be plodding along in the same old way.

There are a few exceptions, of course, where, for instance, the central station does not actually sell merchandise, but where it does actively co-operate with the dealers through showroom and window displays, billboards, newspaper advertising and special electrical shows. These cases, however, are exceptions to the general rule. Selling merchandise at cost has been proved unnecessary. Both merchandise and energy profit can be produced at the same time. Maintaining list prices puts everybody on an equal footing. The more everybody sells, the more the central station benefits; the more everybody sells.

Another concrete example of the result of central-station inactivity is the experience, some years back, of our company. Our selling records included a comprehensive map tack system. A black tack was placed on every town showing the location of our dealers, which in those days reflected the town's appliance activities in a large sense. The map was pretty well covered throughout the state with the exception of an area in central California that was practically barren of dealers. An investigation easily revealed the fundamental cause—central station passiveness and inactivity. The public was not "sold" on the electrical household idea. It was surprising to note how quickly this condition changed when these central stations interested themselves in appliance merchandising. The barren area filled up rapidly with tacks as new dealers sprang into existence.

Almost every central station maintains an office with a large amount of display room available. In the majority of cases they are active merchandisers. Great numbers of people come into their offices during the month to pay their bills. Aside from other considerations, this puts the central station in a very favorable position to merchandise which is not enjoyed by the majority of other classes of merchants. It is good business from every angle because the display room can be made to pay overhead and show a profit. How could we answer the question of "Should central stations sell appliances?" with anything but "Yes"? We believe that individual experience will justify this answer.

## How Syracuse Connection Service Stood Up on Moving Day

THE account of the Syracuse (N. Y.) Lighting Company's method of connecting customers' service within three hours after the signing of the application which appeared in the ELECTRICAL WORLD of April 14 has aroused much interest among central-station men. One question has been raised as to how the system would operate under stress of abnormal conditions such as are presented by the annual moving of many customers from one house to another. Manager G. I. Vincent answers this question in describing the annual moving rush, which comes in Syracuse the last few days in April and the first two or three in May. He says:

"In a normal day about 150 orders go over the counter at our customers' department. About as many more go directly to the order executing department, as all trouble orders coming in on the telephone pass the customers' department altogether. In addition, the men pick up some orders themselves. On April 30 759 orders went over the counter. I watched the operations myself several times during the day and do not believe that any customer waited more than thirty seconds for attention. This flexibility is obtained by having a number of employees in adjacent departments trained to wait on the customer. These employees are engaged in work which does not have to be done instantly so they can drop it on call and return to it later. A buzzer at the customers' counter connects with this department, which is immediately adjacent. A touch of the button calls an employee at once. During one short period on April 30 there were sixteen employees at work on the counter.

"The number of orders of all descriptions executed in normal times is about 350 per day. On May 1 1,042 orders were completed and on May 2 2,322. As nearly as we can ascertain there was absolutely no customer left without service who desired it on either of these two days. Of course, very many had to request postponement from the first to the second of the month because they were unable to secure the services of the movers. The flexibility in the order executing department is obtained by using all alternates who are regularly engaged in other work and by dropping all routine work, such as changing meters.

"No attempt was made to keep actual time lapses because any of our customers securing service on these two days would be more than satisfied. On normal days we still maintain easily the bogey of two minutes for transmission and three hours for completion."

ONE OF THE SYRACUSE COMPANY'S EIGHTEEN SPECIAL TRUCKS USED IN ITS THREE-HOUR CONNECTION SERVICE

# If 1923 Appliance Sales Were Increased 20 per Cent

CENTRAL-STATION companies recognize the importance of domestic appliances as load builders, but their full value becomes apparent only when it is considered that they may add over $75,000,000 to the annual gross income of these companies this year. This does not mean money received from the sale of merchandise—it is purely operating revenue from energy sales, and most of it at profitable rates. If the expectation, based on data compiled by *Electrical Merchandising*, is realized, $287,875,000 worth of appliances will be sold during 1923. These figures embrace in all 12,956,000 appliances classified as the accompanying table shows. And it is estimated that the income value of these appliances to be added to the lines in 1923, in revenue for energy consumed, will approximate $83,000,000. Consumption on the appliances included is calculated at a 10-cent rate and on the following annual income basis:

| | Per Year |
|---|---|
| Washing machines | $8.00 |
| Vacuum cleaners | 4.00 |
| Portable lamps | 3.00 |
| Flatirons | 12.00 |
| Fans | 2.00 |
| Ranges | 60.00 |
| Refrigerators | 60.00 |
| Radiators | 18.00 |
| Toasters | 4.00 |

Naturally, these figures are only estimates, as no adequate definite information on this subject exists. Sewing machines, ironing machines, dishwashers, kitchen power units, violet rays, vibrators and utility motors have not been figured in because their consumption is still more difficult to estimate. Heating pads, curling irons, waffle irons, grills, hot plates, fireless cookers, hair driers and miscellaneous heating appliances, totaling in all 626,000 appliances, are lumped as good for probably $2,000,000 in revenue to the central stations.

Taken this way, as mass statistics, these totals carry little inspiration. It is interesting to consider, however, what any extra effort to increase the sales of these commodities would mean. On the above basis, if a 20 per cent increase were realized, this would mean a gain in sales to the central stations, dealers, contractors and other retailers of 2,591,200 additional appliances, bringing an additional income from sales of $57,575,000 and an increase in annual revenue to the central station of $16,303,000.

In an average city of 100,000 population it is estimated from these figures that electrical merchandise sales would be swelled by at least $100,000 and the local light and power company would secure an increase in residence appliance income of approximately $30,000. This calculation is based on the rough assumption that half the population of the United States is beyond the reach of power lines and would not be affected.

WHAT 20 PER CENT INCREASE IN APPLIANCE SALES WOULD MEAN

This tabulation is based on *Electrical Merchandising's* estimate of electrical appliance sales for the year 1923. It shows what a 20 per cent increase in sales would mean in terms of the various household appliances which, according to this estimate, will be sold this year.

| | | | | | If 1923 Estimates Could Be Swelled 20 per Cent the Increase Would Be | | |
|---|---|---|---|---|---|---|---|
| Items | Est. No. Sold, 1923 | Est. Reta Value | Energy Consumption per Unit per Year* | Estimated Annual Value of Energy Consumed by 1923 Sales | Number of Machines Sold (Increase) | Value of Sales (Increase) | Annual Value of Energy Consumed (Increase) |
| Washing machines | 600,000 | $75,000,000 | $3 | $1,800,000 | 120,000 | $15,000,000 | $360,000 |
| Vacuum cleaners | 1,000,000 | 50,000,000 | 4 | 4,000,000 | 200,000 | 10,000,000 | 800,000 |

* Note.—Energy consumption figured at 10 cents pec kilowatt-hour in case of all appliances except ranges and refrigerators, where 5-cent rate is assumed.

## Purchased Power Gaining in Cement Industry

THAT the advantages of electric drive are well recognized by the portland-cement manufacturers is evident from the United States Census Bureau's recently published figures on that industry. The heavy power requirements of cement making and the development of conflicting tendencies with reference to the purchase of power from central stations give these figures especial significance. The trend toward the purchase of central-station power is verified by recent observations in the cement industry.

The total primary horsepower reported by cement manufacturers for the year 1919 was 488,808. With a liberal allowance for the comparatively small amount of natural and pozzuolanic cements made, over 485,000 hp. must have been devoted to the manufacture of portland cement. This, includes purchased power, all of which was electrical. The average horsepower per plant was well over 4,000, while the total ranked the industry tenth among all manufactures.

Rented primary power increased nearly 23 per cent in the ten-year period 1909 to 1919, raising the percentage from 14.6 in the former year to 37.3 in the latter. Of the total power, 70.7 per cent was utilized to operate electric motors. Slightly over half of this electrical power—52.8 per cent, to be exact—was obtained from central stations.

Since the number of cement plants operating last year, the record year in the industry, was greater than in the slack period extending through 1919, and since the 1922 output was about 40 per cent larger, the power needed for cement making was also considerably more. The increase in installed horsepower was by no means proportional to the gain in production, however, for the plants were operating at only 60 per cent of capacity in 1919 and much of the manufacturing equipment was idle or running under light load. The

record output of last year was about 78 per cent of the producing capacity of the plants.

All recently built cement mills have been equipped for electric power, and several of the older establishments have changed over to the use of electricity since the last census was taken, in most cases buying power.

The consumption of power in the cement industry is chiefly in the many crushing and grinding operations. The raw materials, including the coal for the burning, must be finely pulverized and the resulting clinker reduced to a fine powder to produce cement. From the nature of these operations wear on cement-mill equipment is rapid. In consequence stoppages for repairs or replacements are frequent, making unit motors convenient and economical. Because of this suitability and the industry's heavy power requirements, it offers an important market for electrical energy—a market equal to that furnished by the manufacturers of glass, agricultural implements, paints and hardware combined.

The change to electric drive in some cases has brought unexpected complications. For instance, an electrically operated shovel was put to work in a cement-mill quarry alongside two steam shovels. The electric machine was repeatedly tied up by breaks in the shafts, while such mishaps were unknown on the steam shovels. Finally it was ascertained that whenever the electrical shovel took too big a bite the motor, instead of stalling, would momentarily carry 100 per cent overload, stressing the shaft to twice its designed capacity. As the load was suddenly applied, this proved enough to break the shaft, whereas with the steam equipment the engine merely stalled when the dipper was overloaded.

Since the shafts could not be made larger without a radical change in design, a special nickel-chrome steel shaft, carefully heat-treated, was employed. The new shafts then had twice the elastic limit of the metal used in the original shafts and were sufficiently ductile to withstand all usual shock and vibration, yet they were no larger.

BATTERY OF MOTORS OPERATING FINISHING MILLS IN CEMENT PLANT

Opposing the tendency to purchase power for cement-mill operation there is one factor to which cement manufacturers are giving careful consideration. That is the installation of waste-heat boilers for the utilization of the heat in the gases which leave the kiln at 1,200 deg. to 1,600 deg. F. in dry-process plants and 800 deg. to 1,100 deg. in wet plants. Though a number of these installations are in operation, their cost is high and involve large initial expenditures. Not only is the boiler equipment itself expensive, but the arrangement naturally entails a generating plant for which the cost of operation, maintenance, interest and depreciation may offset the apparent savings of the waste-heat boilers.

## Customer's Monthly Bill and Check Combined

THE Bloomfield Utilities of Bloomfield, Ky., uses the reverse side of the customer's bill as a check should the customer at that time be without blank checks. Wherever possible the money is collected at the time of reading the meter. The meter readings are entered on this check, the bill figured and a 5 per cent discount allowed if the bill is then paid on the spot. By thus combining both the bill and a readily available check it is a very simple matter for the consumer to pay the bill on presentation, for all he has to do is to write the name of his bank, the amount of the check and his name.

## What Other Companies Are Doing

**Minneapolis, Minn.**—As a result of an active employee-ownership policy the Northern States Power Company has increased the number of employee shareholders from 15 to 83.5 per cent. Out of the 2,180 employees, 1,820 now have one or more shares of the company's stock. This campaign was started a short time ago under the direction of R. F. Pack, vice-president and general manager, in order to induce the employees to share in the company's earnings.

**Boston, Mass.**—Fifteen thousand persons visited the electric home established by the Boston Electrical League April 14 to May 5, and sales of household conveniences and of house wiring appear to be directly traceable in many instances to this exhibit. A feature of the display was the visiting of the home by various groups of people residing in distant communities, automobile parties being made up for this purpose with provisions for their comfortable reception by members of the organization and their employees.

**Illinois.**—Following the example of the Commonwealth Edison Company, the Public Service Company of Northern Illinois has published a thirty-two-page year book, which presents to its stockholders detailed information relative to the business, properties and finances of the company in which they hold part ownership. The year book reviews the business of 1922, when the company served 220,160 customers, and points out the interesting fact that 36 per cent of the company's stock is now held by women.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Midway Plant of the San Joaquin Light & Power Corporation.*—E. A. QUINN.—The presence of large quantities of natural gas developed as a byproduct from oil wells in its district had a definite bearing upon the locating of a steam-electric plant of the San Joaquin Light & Power Corporation at Buttonwillow, Cal. The low cost of the gas enables this company to supplement its hydro-electric power with the energy generated in this steam plant. Some of the features discussed are the boiler-room equipment and turbo-generators, which are rated at 10,000 kw., 11,500 volts, 80 per cent power factor, three-phase, 60 cycle.—*Journal of Electricity and Western Industry*, April 15, 1923.

*Pulverized Fuel Plant at Providence.*—The United Electric Railways of Providence is making power-plant improvements which will cost upward of a million dollars by installing new boilers equipped to burn pulverized coal in one-half of the present boiler house. An interesting feature of this installation is the method of ventilating the boiler walls. Drawings show the vertical section of the boiler plant and a plan view of boiler showing pulverized-coal equipment and cross-section of burner and mounting.—*Electric Railway Journal*, April 28, 1923.

## Generation, Control, Switching and Protection

*Short-Circuit Forces in Transformers.*—J. BIERMANNS.—The electrical and the mechanical design of a transformer are frequently opposing problems, requiring a compromise solution satisfying fully neither of them. For example, from the standpoint of electrical strength it would be highly desirable to abstain from any solid material coil-supporting structure, because good oil is still the most dependable insulator. For mechanical reasons, however, the coils have to be strongly braced, to withstand safely the pressure of many tons exerted upon them during overloads or short circuits. The theory of short-circuit forces on transformers is not fully developed yet. Little can be found in textbooks, and nothing has been published as yet on the influence of asymmetries, such as must occur in the process of manufacture or the bringing out of leads and taps, upon the resulting unbalance of mechanical forces. In order to arrive at definite conclusions, the author was forced to idealize some of the conditions with which he deals, but this has been of such a nature as not to cause any appreciable difference between theory and practice. The developed formulas were checked on a 10,000-kva. transformer and gave values slightly higher than those actually measured. In his highly mathematical paper the author calculates the forces on a cylindrical transformer winding and modifies the equations for other types of coils, such as disk coils, etc. The short-circuit forces are first calculated for perfect symmetry between the windings themselves and between windings and the magnetic core and are then investigated for slight asymmetries. — *Bulletin de l'Association Suisse des Electriciens*, April, 1923.

## Transmission, Substations and Distribution

*Rotary Converters to Improve Power Factor.*—E. EVERS. — A theoretical paper showing to what an extent the power factor of a network can be improved by using standard rotary converters. A six-phase converter is compared in its phase-regulating ability with other devices for the same purpose, and it is shown that a rotary can be used with economical advantage if the phase advance in the net does not exceed that equivalent to 80 per cent power factor, measured at the collector rings. For larger displacements the synchronous motor will be more advantageous owing to its lower cost.—*A. E. G. Mitteilungen*, March, 1923.

*Unusual Sleet Formation on a 120,000-Volt Line.*—C. DUVAL.—The double three-phase, 120-kv. transmission line of the Basse-Isère plant, connecting Beaumont with Saint-Etienne, passes over Mont Pilat (1,186 m. in height) and traverses a country of extremely rough climatic conditions. The cables used are steel-aluminum. In the most endangered sections the cross-section of this cable is increased from 102 sq. mm. to 148 sq. mm., while at the same time the normal span of 140 m. is reduced to only 80 m. Various forms of sleet formation on the line are described.—*Revue Générale de l'Electricité*, March 31, 1923.

*Electricty on the Farm.*—J. W. PURCELL and A. G. LANG.—A nine-page review of progress up to date in the Province of Ontaria as concerns electric light and power in the rural districts. The authors consider the difficulties encountered, the limited rural demand for power, basis for estimating rates, primary distribution, installation of power lines, pole spacing, underground construction and electrical appliances that may be utilized on farms. —*Electrical News*, April 15, 1923.

## Units, Measurements and Instruments

*Measurements of Oil Flow in Transformers.* — F. MÜLLNER. — Two new methods are given for measuring the speed of the oil flow in transformers caused by the heating of windings. By the first method the time is determined which it takes for a thermometer to drop from a preheated point down to the temperature of the flowing oil. The faster the oil flows, the faster the mercury will drop. Calibration curves are given for these measurements, not only for oil, but also for water and air. The second is an electric method and is recommended for all cases where it would be impossible to read the indications of a thermometer. A very small ball of fine, insulated copper wire is wound, its diameter being only about ¼ in., its ohmic resistance at 15 deg. C. about 0.15 ohm. This measuring ball is used with three adjustable resistances in a Wheatstone bridge connection. The ball is inserted in the flowing oil, and the amount of watts is measured which is required to keep this ball heated to a constant temperature. This is accomplished indirectly by determining the resistance of the ball. The other three resistances of the bridge are varied in such a way as to keep the current through the bridge galvanometer zero. Calibration curves are given for different temperatures. — *Elektrotechnik und Maschinenbau*, April 8, 1923.

*Production of Porcelain for Electrical Insulation.*—F. H. RIDDLE.—This article deals with ceramic raw materials, chiefly clays, quartz and feldspar used in making insulators or insulating materials. Porcelains are now being used in which natural and synthetic sillimanite, reclaimed quartz and alkaline earth replace alkali.—*Journal of the A. I. E. E.*, May, 1923.

## Illumination

*Illuminating Business Districts.*—S. B. WILLIAMS.—The author considers the reasons why an ornamental lighting system is an asset to the business district of every city, together with information gathered from numerous sources on desirable practice under present conditions for size of lamp, pole heights, spacing and arrangement, glassware, posts and illumination intensity, cost and the necessity for a maintenance schedule. Several types of painted posts and glass-globe units, suitable for white ways, are illustrated. —*Electrical Record*, April, 1923.

*Flexibility in a Lighting System.*—J. M. KETCH and A. F. IRISH.—The author shows the value of flexibility and how it can be obtained by adequate wiring and switching, correct spacing of outlets and selection of proper lighting reflectors. Among the factors that contribute toward flexibility of an electric system are the proper spacing of outlets, so that, regardless of the lamp wattage, a uniform level of illumination may be obtained over the entire work-

ing surface, an illumination of sufficient high foot-candle value to care for the most exacting work carried on, sufficient copper to permit more light or wattage to be obtained when needed, a switching arrangement that will economically provide light at the desired time and place, and the selection of a reflector that will allow for a future change in lamp size and wattage.—*Industrial Engineer*, May, 1923.

### Motors and Control

*Large Sump and Night Pumping Lower Peak Load in Coal Mine.*—A. F. Brosky.—By employing a large sump and pumping the water out of the mine during non-peak load, the Hecla Coal & Coke Company, at Isabella, Pa., has effected a very large saving. The water in this mine was originally pumped out by steam pumps, which have recently been replaced by electric pumps. Pumping at non-peak hours was made possible by employing a reservoir that holds over a million gallons into which the water gathers during the daytime. The electrical features of the installation for pumping are considered.—*Coal Age*, April 19, 1923.

*Application of Electric Motors for Driving Tube Mills.*—F. Jeffrey.—One method of individual drive is through the medium of a reduction-gear unit, the main gear of which is an integral part of the tube mill proper, and a low-speed direct-current motor. When dust and dirt are prevalent the gears may be inclosed and occasionally run in oil, although it is always advantageous to eliminate the foreign matter from the surrounding air if possible. Another method of individual drive is through the medium of the gear unit, but a high-speed motor is used and belted to a countershaft. Group drive is used extensively, and in cases of this kind the tube mills are usually belted to a line shaft. Such a method of drive presents a different problem, which may, however, be studied from a knowledge of the requirements of each individual mill and the results then combined in such a manner that all overlapping will be properly considered. The author discusses the application of the slip-ring-type induction motor and squirrel-cage motor to the tube mill, and the application of a synchronous motor to the tube mill.—*Journal of the A. I. E. E.*, April, 1923.

### Heat Applications and Material Handling

*Dimensioning of Contact Trolleys on Cranes.*—E. Rosseck.—The paper gives data on a great number of three-phase brake magnets and on a few brake motors, stating the current demand at the start and for holding the torque, etc. The motor brakes are electrically better and require much less current, but their high cost prevents their more general use. In a practical example, in which the current consumption of the lift motor of a crane is calculated and vectorially checked for each controller contact, the great importance of considering the large current demand by the brake magnets is illustrated.—*Elektrotechnische Zeitschrift*, March 29, 1923.

*Heat-Insulating Materials for Electrically Heated Apparatus.* — J. C. Woodson.—While there are numerous grades of heat insulators on the market, there are none that can compete with electrical insulators. Of all the different grades, there are only a few fundamentally different sorts. In all of these materials the insulations are utilized almost entirely in the entrapped dead-air spaces of their structure. While the conductivity of an insulation is of primary importance, other thermal characteristics must be considered, such as specific heat and specific weight. The application also has to be considered with regard to the physical properties of the material.—*Paper presented before American Electrochemical Society, New York*, May 3-5, 1923.

### Traction

*Magnetically Controlled Track Switch*—E. Halle.—This apparatus, used to some extent on European street-railway systems, serves to set track switches from the running trolley car by means of an auxiliary contact on the trolley wire and a magnetic solenoid, actuating with a lever the tongue of the switch. Passing the contact with the current in the car on or off sets the switch in one or the other direction. A different trolley contact has to be installed for the arch-type or the wheel-type current collector. The apparatus may be erected above or entirely below the surface of the road and is in both cases built waterproof. To enable the motorman to see safely in which direction the switch is set during the night hours an automatically operated luminous arrow sign is usually part of the switch equipment. — *A. E. G. Mitteilungen*, March, 1923.

*Locomotives for the Swedish Riksgräns Railway.* — P. Friebel. — The paper describes in great detail the freight and express locomotives being built for the Riksgräns railroad. This is a single-phase, 14,000-volt, 15-cycle main-road electrification, used primarily to haul heavy ore trains. The power transmission from motors to drivers is accomplished with an elastic pinion and gear to a jack shaft and with horizontal rods to two or four drivers. The freight engines are of the O-D-O type, whereas the express engines are built as 2-B-B-2 and represent two identical halves coupled together. It is of interest that the entire electrical equipment of one-half of the express-type locomotive is in every respect the same as that of the freight-type engine. Some of the characteristic data of these two machines are given in the accompanying table.—*Elektrotechnik und Maschinenbau*, April 22, 1923.

CHARACTERISTICS OF FREIGHT AND PASSENGER LOCOMOTIVES

| | Freight | Express |
|---|---|---|
| Length over all, m | 11.25 | 21.4 |
| Diameter of drivers, mm | 1,350 | 1,350 |
| Weight complete, metric tons | 68.6 | 123.2 |
| Weight of electric part, metric tons | 42.1 | 70.6 |
| Weight of mechanical part, metric tons | 26.5 | 52.6 |
| Maximum speed, km.-hr | 60 | 100 |
| Maximum torque at start on circumference of drivers, kg | 18,000 | 16,000 |
| One hour output of locomotives, hp. | 1,130 | 2,260 |
| Number of motors | 2 | 4 |
| Motor current for one hour rating, amp | 1,700 | 1,700 |

### Telegraphy, Telephony, Radio and Signals

*Use of Loud Speakers in a Hospital.*—A unique use of telephonic loud speakers has been made in a French hospital where medical students can watch operations performed by a surgeon. Above the operating room is a glass roof through which the procedure of the operation can be observed. The surgeon, who gives during his work an explanation of what he is doing, talks into a microphone, the current of which is amplified by a battery of ten electron tubes, and actuates a number of loud-speaking telephones in the upper observation room so that the students not only see what the surgeon is doing but receive also the necessary explanations at the same time.—*Radio Electricité*, April, 1923.

*Theory of Electric Wave Filters Built Up of Coupled Circuit Elements.*—L. P. Peters.—An abstract of this paper may be found in the Electrical World report of the A. I. E. E. midwinter convention, Feb. 24, 1923, on page 442.—*Journal of the A. I. E. E.*, May, 1923.

*Some Improvements in the Poulsen Arc.*—P. O. Pederson.—The possibility of increasing the efficiency of the Poulsen arc by burning it in a non-homogenous magnetic field is mathematically investigated and experimentally verified.—*Proceedings of the Institute of Radio Engineers*, April, 1923.

*Development of Cables Used in the Bell System.* — F. L. Rhodes. — The author discusses early types of cables, loaded cables, the application of repeaters to loaded circuits in cable, quadded cables and various types of sheathing for cables. — *Bell Telephone Quarterly*, April, 1923.

### Miscellaneous

*Methods of Analyzing Power Costs.*—A. J. Whitcomb.—An analysis of the different ways in which power costs can be checked and distributed among departments or processes in proportion to the amounts required. The author deals with the auditing of power-service requirements and tells what a proper distribution of power costs is and what it is not. He points out that power in kilowatt-hours represents dollars and cents of the same kind that go into the pay envelopes for labor. For the same reason that the paymaster is not allowed to make an error of 10 or 15 per cent in figuring his payroll, the method of accounting for power used should not permit such a range of guesswork.—*Industrial Engineer*, April, 1923.

# News of the Industry

## Discuss Power Test Codes

**Public Hearing at Montreal Convention of A. S. M. E. Arouses Interest—To Work with N. E. L. A.**

MEETING in Montreal for its annual spring convention on Monday to Thursday of this week, with a registration of more than six hundred, the American Society of Mechanical Engineers held a public hearing on two of the nineteen power test codes being framed for suggested international adoption. These two codes deal with standardized measurements for power equipment and for internal-combustion engines. The hearing created great interest and much discussion. The general opinion was that it would be desirable to co-operate with the National Electric Light Association's code committee on the same requirements.

H. G. Acres, hydraulic engineer of the Hydro-Electric Power Commission of Ontario, predicted the use of propeller-type turbines for the St. Lawrence development and stated that the Johnson valve and surge tank, the spreading draft tube and the Kingsbury bearing had made possible large turbine development. Recent tests showed that the turbine in which the hydrocone extended to the runner hub was the most efficient type. The Queenston unit gave 93 per cent efficiency by the Gibson method, he said. Prof. R. W. Angus said that Mr. Acres' paper applied also to low-head plants. H. B. Taylor and L. F. Moody agreed with the statements made in the paper. Mr. Taylor said there was no limit to the size of units from the construction standpoint.

A paper on steam-line sectionalization and control presented by Peter Payne Dean, president Payne Dean, Ltd., Stamford, Conn., was well received.

## Power Survey Bill Becomes Law in Pennsylvania

Governor Pinchot of Pennsylvania has signed the power survey bill passed by the Legislature at his instance. This law creates a board, consisting of the Governor, Attorney-General, Commissioner of Forestry, secretary of the Water Supply Commission, chairman of the Public Service Commission, Secretary of Agriculture, Commissioner of Labor and Industry, State Geologist and a Deputy Attorney General, to undertake an outline survey of the water and fuel resources available for the state and of the most practicable means for their full utilization for power development. The board is also empowered to recommend in outline a policy with respect to the generation and distribution of electrical energy to railroads, farms and homes.

The Governor has also signed the bill providing for a board to confer with similar agencies of New York and New Jersey on the regulation of the flow of the Delaware River

## Los Angeles' Public Service Body Wants $35,000,000

A thirty-five-million-dollar bond issue to cover the projected activities of the Public Service Commission of the city of Los Angeles will be voted on at the municipal election June 6. Approximately $10,000,000 will be spent in rehabilitating the city distribution system and in improvements to the present hydro-electric system, if the voters indorse the issue. The remaining $25,000,000 is to be used for power development at Boulder Canyon on the Colorado River when the dam at that location is completed. The bond issue is being opposed by the Taxpayers' Association, a newly formed organization.

## Los Angeles Loses Again

**Highest Court Decides Against Its Power to Acquire Property Already in Use to Serve Public**

THE United States Supreme Court has recently dismissed the petition of the city of Los Angeles for a rehearing of the city's case against the Southern Sierras Power Company for condemnation of property owned by the power company on the Owens River, in southern California. The decision of the Supreme Court ends a controversy which has been in progress since February, 1920. The first decision, handed down by the United States District Court, granted the city a right to condemn the property. The power company appealed to the United States Circuit Court, and Nov. 5, 1922, that body decided that no showing had been made that the public use of natural resources by a municipal corporation was more necessary than use by a public utility privately owned and serving other communities. The decision of the lower court was thus reversed.

Throughout the litigation the cities of Riverside and San Bernardino gave legal assistance in the fight against the city of Los Angeles.

A bill designed to give Los Angeles the power sought and now finally denied her was recently tabled in the State Senate.

## Contracts for 240,000 Kva.

**Generating Equipment Ordered from Canadian Westinghouse by Quebec Development Company**

EIGHT hydro-electric generators rated at 30,000 kva. each at 80 per cent power factor, generating 13,200 volts, three-phase, 60-cycle, at 112½ r.p.m., have been ordered from the Canadian Westinghouse Company, Hamilton, Ontario, by the Quebec Development Company. These generators are to be of the vertical-shaft type equipped with Kingsbury thrust bearings. A directly connected exciter with a capacity of 225 kw. at 250 volts will be supplied with each generator. The contract also includes the installation of this equipment in the new plant of the Quebec Development Company at Isle Maligne, on the Saguenay River, 3 miles from Lake St. John. The apparatus covered by this order was designed by the engineers of the Canadian Westinghouse Company in collaboration with the engineers of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., and is of standard Westinghouse construction. It will all be built in the Hamilton shops of the Canadian Westinghouse Company.

In December, 1922, James B. Duke, president of the Southern Power Company, and Sir William Price, president of Price Brothers & Company, Ltd., of Quebec, incorporated the Quebec Development Company for carrying out the great hydro-electric and paper-mill project described in these columns at that time. A potential development of 1,200,000 hp. through the construction of a dam at the Grand Discharge from Lake St. John at the head of the Saguenay River is foreseen.

Price Brothers will erect two new mills in which much of the new power will be used, and existing mills will be converted to the use of electric power. They have agreed to take from the company 200,000 hp., perhaps the largest contract ever placed by a consumer for electric power. It is estimated that the saving of coal thus effected will amount to $1,500,000 yearly. The cost to Price Brothers of building the new mills and making alterations to the old ones is put at about $17,000,000.

Of the eight officers and directors of the Quebec Development Company, six are American and two are Canadian. The company, which is incorporated under Canadian law, is capitalized at $25,000,000, the entire capital stock being supplied by Mr. Duke and Sir William Price.

## Federal Board Activities

**Declarations Filed Affecting Development of Delaware and Future Status of Muscle Shoals**

A DECLARATION of intention has been filed with the Federal Power Commission by the Pennsylvania Power & Light Company, a subsidiary of the Electric Bond & Share Company, covering a large project in the vicinity of Scranton, where it is proposed to construct a reservoir storing 9,000,000,000 cu.ft. of water. It is proposed to develop 47,000 kw. in the Wallenpaupack River. This reservoir will have an important bearing on the development of the Delaware River. Plans being considered for the development of this river call for the ultimate harnessing of 450,000 hp. between Hancock, N. Y., and Belvidere, N. J.

Another declaration of intention has been filed with the commission covering a project on the Pigeon River in North Carolina. The Pigeon River is a tributary of the French Broad River, which in turn is a tributary of the Tennessee. While the Pigeon River project concerns a development of only 30,000 hp., it is regarded as possessing great significance. This proposal, together with projects on the Clinch, Powell and Holston Rivers, indicates that big interests in the power and industrial fields have turned attention to this important region. It is understood that most of the power is being sought for electrochemical and electrometallurgical use. It is fully expected that the next few years will see the power resources of this region developed as they have been on the eastern slope of these mountains by the Southern Power Company. These developments, however, are being actively opposed by certain interests concerned with the development of Muscle Shoals as it is feared they may detract from carrying through cherished hopes.

As much as possible of its pending business will be disposed of by the commission prior to June 15. On that date two of its members, Secretary Work and Secretary Wallace, will leave with the President on his Alaska visit. This will preclude any further meetings of the commission until early fall, and for that reason a large amount of important business will be transacted in the next two weeks.

## Electric Steel Founders Pursue Research

The "electric steel founders' research group" held a regular meeting of executives of the five electric steel foundries conducting co-operative research work at Wernersville, Pa., on May 14 to May 17. Representatives were present from the Electric Steel Company of Chicago, Fort Pitt Steel Casting Company of McKeesport, Pa.; the Lebanon Steel Foundry of Lebanon, Pa.; the Michigan Steel Casting Company of Detroit and the Sivyer Steel Casting Company of Milwaukee, in addition to R. A. Bull, research director of the group.

The various phases of the research work being done by the members of the group to improve the quality of steel castings and increase efficiency in methods were discussed in detail. Formal reports giving the status of the present research investigations were read on such subjects as facing-sand mixtures, core-sand mixtures, electric furnace practice, heat treatment of steel castings, production control, porosity in castings, etc. Plans were made for conducting research investigations on additional steel foundry problems. The results obtained from the work done have, in the opinion of the research group, been so beneficial as to make it highly desirable to study intensively some of the additional complex problems involved in making thin-section electric steel castings of intricate design.

# Missouri Operators Sail the Mississippi

**Transmission Economics, Oil Engines for Small Central Stations and a Manufacturer's Viewpoint of Utility Problems Are Discussed at Annual Convention Afloat**

ELECTRICAL transmission problems dominated the proceedings of the seventeenth annual convention of the Missouri Association of Public Utilities, which was held aboard the steamer Harry G. Drees on May 23-26. The paper on this subject had been prepared by L. W. Helmreich and N. C. Mann, engineers of the Missouri Public Service Commission. Besides explaining the economics and value of interconnection, four factors were considered in analyzing the future growth of long transmission lines, namely, absorption of acquired isolated plants, formulation of equitable rate structures for transmission groups, financing of initially unremunerative projects, especially rural service, and, lastly, conflicts with communication systems.

With regard to the financing of rural lines, Mr. Helmreich reviewed the practices adopted by other states and concluded that while transmission and primary rural extension lines may be viewed simply as extended urban primaries, the main rural lines represented an investment serving a restricted, unchanging group.

F. S. Dewey, Kansas City, warned operators of a future day when rural reconstruction will be a still harder problem for the utility and the farmer if the utility does not require a high grade of construction at the present time. J. E. Hillemeyer, St. Louis, urged that more study be given to the uses of power on the farm in order to reduce the fixed charges and energy rates. He failed to see why a telephone company operating a grounded system should be allowed to blame unbalance on the power companies. W. F. Corl, Mexico, declared that since electricity would eventually decentralize industry by bringing it out to the country it was better to give the farmer service than eventually to face a farmers' "bloc."

### Plan for Rural Rates

N. C. Mann presented an illustrated paper on proposed rates which would be proportional to the product of the connected load and its distance from the generating plant. The plan was to isolate and deduct from the total system charges those peculiar to transmission elements. The remainder would form a basic rate structure applicable throughout the entire group. The deductions properly allotted would determine the differential to be added in each case to the basic structure.

On Thursday morning George A. Hughes, president Edison Electric Appliance Company, Chicago, treated public utility problems from a manufacturer's viewpoint with special reference to social and economic unrest. He pleaded for an avoidance of prejudice as well as of socialistic pitfalls.

W. H. Henby reported on the year's work of the Missouri Committee on Public Utility Information, which is now distributing 1,900 copies of its weekly bulletins to 600 state newspapers, high schools and members of the Legislature. He felt that if utilities based their story on the development and conservation of national resources, they would encounter little difficulty when asking for higher rates.

J. D. Van Maur, St. Louis, thought that the public was fair-minded when once it was told all the facts in terms it could understand. He drew especial attention to the published letters from high-school principals commending the committee for its work with the classes in economics and science.

### Diesel-Engine Costs

The paper on the application of oil engines for small central stations prepared by Stanley Stokes, St. Louis, was read in his absence by J. E. Hillemeyer. Cost data were included from five plants ranging from a capacity of 50 kw. to 1,000 kw., with a net monthly generating cost per kilowatt-hour varying from \$0.0369 to \$0.1833. Since it was the load factor which created such a wide variation in costs, the investment costs must be kept at a minimum. Costs on the Diesel type will run \$168 to \$187 per kilowatt of rated capacity fully installed.

J. B. Sheridan, manager of the Public Utility Information Bureau, gave a comparison of utility earnings for 1915 and 1921 during a period when the total operating expenses of Missouri electrical utilities had increased 136.3 per cent with a decrease in net return of 33.9 per cent. For the same period taxation had increased 170 per cent, coal costs had jumped 170 per cent and labor 131 per cent.

A question-box session was conducted Saturday morning. J. E. Hillemeyer, St. Louis, advised a continual checking up of suspicious bills and favored informing the public of the new state law which holds that a discovered "jumper" is prima facie evidence of theft of electrical energy. Some apprehension as to lawsuits for damages in case of failure to secure conviction was expressed, but John C. Hall St. Louis, urged that utilities should not hesitate to apply the law.

PRESENT VALUATION

The reproduction-new basis of valuation was questioned by C. C. Hellmers of Maryville, James R. Abercrombie of St. Joseph and F. S. Dewey of Kansas City, since it would require continual revaluations without consideration of high costs of construction during a boom period. W. F. Corl and Ben H. Locke, Mexico, felt that since prices of other commodities varied with exchange values utility rates should be based on the same principle.

F. S. Dewey said that since a utility's turnover usually is only once every five years instead of four to five times yearly, it would not need much argument to make the business man see the absolute necessity of an 8 per cent return.

For the coming year the following officers were elected: President, H. C. Blackwell of Kansas City; vice-presidents, J. D. Von Maur of St. Louis, C. L. Proctor of Joplin and Wiley F. Corl of Mexico; secretary and treasurer, F. D. Beardslee. The members of the executive committee will be L. P. Andrews, chairman; E. R. Locke, Herman Spoehrer, F. S. Dewey and John P. Casey. The attendance on this trip numbered 150.

## Westinghouse Jobbers in Session

The eleventh annual convention of the Westinghouse Agent-Jobbers' Association has been in session this week at Hot Springs, Va. The only open meeting was held on Monday afternoon. E. W. Lloyd, chairman of the Joint Committee for Business Development, opened the program and described the work of that organization and its plans. The need for a wider appreciation on the part of the dealer of the fact that his prime function is that of purchasing agent for the public was discussed at length by Howard Ehrlich, editor of the *Jobbers' Salesman*. He pointed out that too many dealers maintain the point of view that they are merely representatives of the manufacturers, whereas the public looks to them for actual advice and assistance in the acquiring of electrical equipment for their homes.

An interesting analysis of the present set-up in retail distribution of electrical merchandise and appliances was presented by H. A. Lewis, manager of *Electrical Merchandising*, in which he pictured the present position of the department store, the hardware store and the drug store in the electrical market. There are at the present time, he said, four thousand department stores and ten thousand hardware stores selling electrical appliances. The department store has a distinct feminine appeal and is chiefly interested in selling staples. The hardware store appeals particularly to men and is organized and habituated to selling established specialties, among which it has gathered a considerable number of electrical devices. About one thousand drug stores are selling electrical merchandise also, principally through window and counter display, and with practically no creative selling. Because the electrical manufacturer in the effort to protect the electrical trade is not selling these retailers quality merchandise, they are largely stocking cheap goods and the public is receiving an improper impression of the quality of electrical merchandise. Mr. Lewis recommended that the electrical industry meet this situation by selling the non-electrical retailer quality merchandise so that the public may select electrical appliances intelligently and not with only cheap goods before them.

Frank E. Watt, editor of the *Electrical Record*, discussed "Liquid Capital as a Check on Business Depression." William L. Goodwin presented the present program of the Society for Electrical Development. An extensive program of committee reports and discussions was scheduled to fill the rest of the week.

# Jobbers Launch Simplification Program

### Many Recommendations Made for Elimination of Excess Varieties—Committee Appointed to Work with Manufacturers and Department of Commerce

DECIDED impetus was given to the promotion of a practical program for simplification in the electrical industry at the last day's meeting of the Electrical Supply Jobbers' Association at its annual summer convention at Hot Springs, Va., last week. Definite recommendations were made by a number of the commodity committees for the elimination of excess varieties in several important lines. The general principle of simplification was enthusiastically indorsed, and a committee was appointed to get in contact with the manufacturers and endeavor to influence a larger reduction in stock varieties and also to call upon Secretary Hoover of the United States Department of Commerce and enlist the aid of the Bureau of Simplified Practice.

COMMITTEE RECOMMENDATIONS

The committee on wire conductors recommended that the number of varieties of heater cord be reduced to one or two and that silk cord be reduced from the twenty-four colors and styles now listed to five or six. The committee on pole-line hardware reported many excess varieties, notably in cross-arm braces, and recommended to the manufacturers a careful study of the existing duplications and the elimination of as many styles as possible. The committee on wiring devices reported that the General Electric Company has recently dropped 860 numbers from its line, Bryant Electric Company 500, Harvey Hubbell, Inc., 400, and Hart & Hegeman 157. The committee held a meeting earlier in the week with representatives of the wiring-device manufacturers, who were present at the convention, and discussed the progress that has thus far been made and the possibilities for further action. An urgent request was made that other manufacturers take similar action in regard to their lines and that these removals be eliminated from all new catalogs both of the manufacturers and the jobbers.

The committee on heating devices called upon the manufacturers to reduce the number of varieties of household appliances, particularly hollow ware, and a questionnaire is being prepared for the purpose of determining what devices should be dropped. Special emphasis was given to the need for standardization of contact pins and plugs at the appliance end of the cord, and manufacturers were asked to adopt the practice of dropping one of the older models whenever a new style is brought out. A resolution was offered by this committee and passed by the meeting addressed to the National Electric Light Association commending the work of the N. E. L. A. wiring committee. The committee on fans recommended the complete elimination of the 16-in. non-oscillating fan, now already abandoned by several manufacturers, and reported that the cost of the ceiling fan is at present entirely out of proportion to the cost of desk-style fans and is seriously interfering with its sale, urging the manufacturers to readjust fan prices on a more equitable basis. The outlet box manufacturers were reported to have already reduced the number of styles from 116 to 21, and it was stated that they are ready to go to one finish as soon as the conduit manufacturers will standardize on one finish for conduit. In support of this situation conduit manufacturers were urged to give consideration to the possibility of the elimination of black iron conduit and the adoption of the galvanized finish as a single standard.

GOING TO HOOVER

Universal enthusiasm marked the delivery of an address by W. A. Durgin, chief of the Division of Simplified Practice, United States Department of Commerce, in which he pictured the progress that has been made in various indus-

tries in the elimination of obsolete, duplicate and other excess varieties. A resolution was passed requesting the Associated Manufacturers of Electrical Supplies to invite Mr. Durgin to give his address at the coming convention of this group of manufacturers in New London on June 26, and a committee on standardization and simplification was appointed, consisting of E. C. Graham (chairman), W. I. Bickford, F. W. Van Winkle, Frank S. Price, Clarence Wheeler, George Cullinan and George W. Johnston. This committee was instructed to confer with the standardization committee of the manufacturers' association in an effort to promote co-operation in the development of the purposes of simplification within the electrical industry and to proceed to Washington for a conference with Secretary Hoover.

## Alabama Company Ready to Develop Tallapoosa

The Alabama Power Company hopes to begin preliminary work on the first of its Tallapoosa River projects by June 15. It will be necessary to build 25 miles of railroad so as to connect the site with transportation. Ultimately the company expects to develop six sites on the Tallapoosa. Plans for this project have just been completed by O. G. Thurlow, the chief engineer of the Alabama Power Company, and provide for the initial installation of two 50,000-kva. units and the ultimate installation of another similar unit.

Application has been made to the Federal Power Commission for the license covering the first development. It is the lowest location on the river and is known as the Cherokee Bluffs project. A dam 105 ft. high is to be built at that point, which is 12 miles above Tallassee, Ala. This dam will create a reservoir with a superficial area of 22,000 acres. The company will be required to discharge a certain maximum flow so as to meet the requirements of navigation in the Alabama River below Montgomery. This requirement is being drafted in such a way that the discharge in the Coosa and the Tallapoosa may be co-ordinated in the satisfying of navigation requirements. Very little storage is possible on the Coosa, so that in high water the Tallapoosa can be stored and the load carried on the company's Coosa plants, while in low water the load will be put on the Tallapoosa plants.

## Training for Leadership to Be Keynote of S. P. E. E.

For its thirty-first annual meeting at Cornell University, Ithaca, N. Y., on June 20-23, the Society for the Promotion of Engineering Education has adopted as its general theme "Training for Leadership." An address with this title will be made by Dexter S. Kimball, dean of the College of Engineering, Cornell. Other prominent educators who will speak or take part in discussions on this and closely related subjects are C. F. Scott, J. H. Dunlap, M. E. Cooley, F. W. McNair, D. C. Jackson, H. E. Dyche, F. E. Turneaure, G. B. Pegram, F. L. Bishop, G. O. Frampton and Ira N. Hollis. "The Engineer as a Leader in Public Service" will be discussed by T. H. MacDonald, chief of the Bureau of Public Roads, Washington, D. C.; "The Engineer as a Leader in Industry" by Oliver S. Lyford, representing the National Industrial Conference Board, and "The Engineer as a Leader in Business" by W. E. Wickenden of the American Telephone & Telegraph Company.

Others who will take prominent part in the proceedings are Profs. J. Raleigh Nelson of Michigan, Edward Bennett of Wisconsin and L. S. Marks of Harvard and Chancellor J. A. Bowman of Pittsburgh. On Wednesday evening, June 20, President Livingston Farrand of Cornell will make his welcoming address, responded to by Professor Scott, president of the society; on Thursday evening the annual dinner will be held, and on Friday evening a "round-table" smoker.

# May Yield Advances to 6.47 per Cent

A TOTAL of $52,026,000 in new electric light and power public utility financing was placed on the market during the month of May. This figure represents a decrease of more than $13,000,000 under April and of more than $17,000,000 under May, 1922. The offerings were large in number—twenty-one—but small in volume. Only two issues exceeded the five-million-dollar mark. The largest single issue was the ten-million-dollar issue of the Illinois Power & Light Company, offered at par and yielding 7 per cent. The average rate of return yielded the investor advanced considerably, from 6.38 per cent in April to 6.47 per cent in May, and was the highest since December, 1922. While the tendency toward long-term securities is still evident, three short-term issues appear in the accompanying tabulation.

SECURITY ISSUES OF ELECTRIC SERVICE COMPANIES IN MAY

| Name of Company | Amount of Issue | Period, Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Arkansas Central Power Co. | $2,500,000 | 25 | First and refunding mortgage gold bonds | To provide working capital | 6 | 94½ | 6.45 |
| Paducah Electric Co. (Ky.) | 1,006,000 | 15 | First mortgage sinking-fund gold bonds, series A | Refunding | 6 | 97½ | 6.25 |
| Counties Gas & Electric Co. (Pa.) | 6,600,000 | 30 | First and refunding mortgage gold bonds | Additions and refunding | 6 | 98 | 6.15 |
| Illinois Power & Light Corp. | 10,000,000 | 30 | Sinking-fund debenture gold bonds, (closed issue) | Refunding and to provide working capital | 7 | 100 | 7 |
| Salt River Valley Water Users' Assn. (Ariz.) | 1,800,000 | 5–24* | Gold bonds | Extensions | 6 | 99 | 6.10 |
| Tennessee Electric Power Co. | 2,500,000 | 24 | First and refunding mortgage gold bonds, series A | Additions, extensions and refunding | 6 | 94½ | 6.45 |
| Arkansas Light & Power Co. | 500,000 | .... | Cumulative preferred stock | Extensions | 7 | 92½ | .. |
| Penn Public Service Corp. | 2,500,000 | 15 | Convertible gold debentures | To acquire common stock of Erie Lighting Company and provide additional working capital | 6½ | 97 | 6.80 |
| Coast Counties Gas & Electric Co. (Cal.) | 250,000 | ... | Cumulative first preferred stock | Improvements and refunding | 6 | 86 | 6.98 |
| Great Lakes Power Co. (Ont.) | 320,000 | 20 | First mortgage gold bonds, series A | | 6 | 97½ | 6.25 |
| Potomac Electric Power Co. (D.C.) | 4,000,000 | 30 | General and refunding mortgage gold bonds, series B | Refunding and to reimburse for construction | 6 | 101½ | 5.88 |
| Pennsylvania-Ohio Power & Light Co. (Ohio) | 2,000,000 | 3 | Secured gold notes | Refunding and additions | 6 | 99 | 6.35 |
| American Public Service Co. (Ill.) | 300,000 | 19 | First lien gold bonds | To provide working capital | 6 | 91½ | 6.80 |
| Eastern Connecticut Power Co. | 1,500,000 | ... | Cumulative first preferred stock | Extensions, purchase of securities and retirement of floating debt | 7 | 100 | 7 |
| Jersey Central Power & Light Corp. | 3,500,000 | 25 | First lien sinking-fund gold bonds, series A | General corporate purposes | 6½ | 97 | 6.75 |
| Kansas Gas & Electric Co. | 3,500,000 | 29 | First mortgage sinking-fund gold bonds, series A of 1922 | Construction | 6 | 95½ | 6.35 |
| Power Corporation of New York | 1,000,000 | 19 | First mortgage sinking-fund gold bonds (series B) | Additions | 6 | 94½ | 6.50 |
| Utica Gas & Electric Co. | 500,000 | ... | Cumulative preferred stock | Additions | 7 | 102 | |
| Edison Electric Illuminating Co. of Boston | 1,000,000 | ¾ | Notes | | 5 | ... | .... |
| Utah Power & Light Co. | 3,500,000 | 21 | First lien and general mortgage gold bonds | General corporate purposes | 6 | 99 | 6.10 |
| Metropolitan Power Co. (Pa.) | 3,250,000 | 30 | First mortgage gold bonds, series A | Construction | 6 | 96 | 6.30 |
| Total | $52,026,000 | | | | | | |

* Due annually.

## Supersystems for New York

**Two Zones, 25-Cycle and 60-Cycle, Will Probably Be Necessary in Interconnection Schemes**

THE plan outlined in considerable detail on page 741 of the ELECTRICAL WORLD for March 31 for interconnection of transmission systems in New York State and connection between New York State systems and those of other states was discussed at the recent Utica meeting of the Empire State Gas & Electric Association by E. P. Peck of the Utica Gas & Electric Company in the light of work done by a committee of the association just named. Mr. Peck said that there was no desire to try to force any recommendations the committee may make on any company, but only to make suggestions for future guidance when interconnection becomes an urgent question.

Owing to the large 25-cycle power system that exists in Niagara Falls and New York City, and because 60-cycle systems are used extensively in other parts of the state, it will probably be necessary in any plan of interconnection to divide the state into 25-cycle and 60-cycle zones. Niagara Falls could never be expected to change from 25 cycles to 60 cycles, because all its power development can be utilized locally and because the only help available to it is from the 25-cycle system across the river. The 25-cycle system in the metropolitan district will never be embarrassing because it is used almost exclusively for railways. For immediate needs it would be adequate to the purpose in view to construct 66,000-volt lines for the interchange of energy, but the towers should be designed for 110,000 volts with more distant requirements in view.

### LOAD-DISTRIBUTION COMMITTEE'S WORK

Considerable work has been done by the load-distribution committee in studying magnitude of loads in different centers, the distances between these loads and between generating stations, the distances between adjacent systems and the amount of power which may be required for interchange, and the most desirable voltage, Mr. Peck said. A map showing the results of this study, as well as systems in adjoining states with which it may be desirable to interconnect some day, is in preparation. The cost of making these interconnections is also being thoroughly studied.

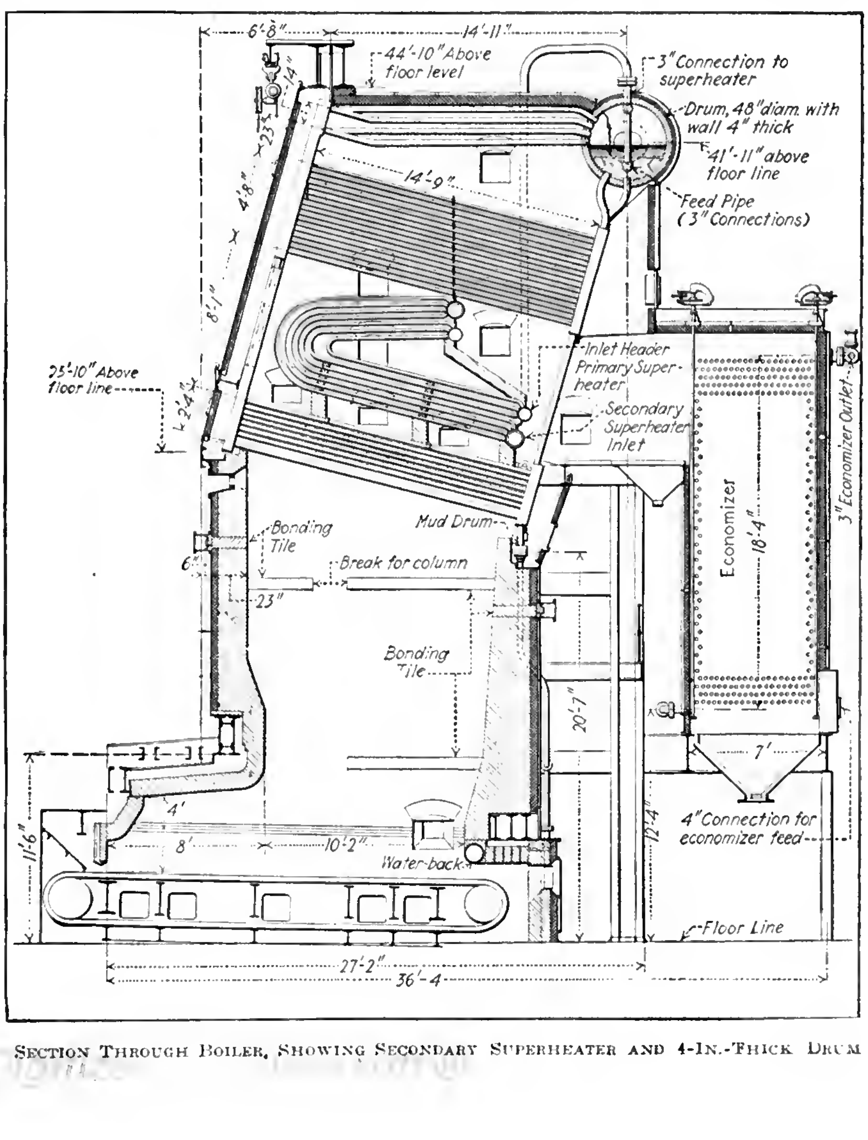
If interconnections are anticipated, declared Mr. Peck, the ultimate expense will be greatly reduced and interconnection hastened. With several sources of emergency supply, the small plants will benefit by interconnection through the assurance of more reliable service. Contrary to the usual impression, low-voltage ties can be used to exchange energy between distant companies without the equivalent transmission loss, because the company nearest the system which has surplus power can utilize that energy in its own system and transmit its power on to the next system and so on, thus relaying the energy to the company which is in need of power. Neither does the plan contemplate parallel operation. Only in emergencies will the companies be connected together. After the engineering problems have been solved and contractual relations settled by executives, the chief problem will be one of load dispatching or adjustment of frequencies and voltages. This problem will be minimized if a friendly spirit is stimulated among the various load dispatchers and their activities are co-ordinated. In its present construction work as well for the future the Utica Gas & Electric Company is planning for such interconnections, as are other companies.

## Commonwealth Edison Innovations

**Experimental Installation Using Steam at 1,200 Lb. Pressure to Be Made in Calumet Station—Design for Turbine Lay-out in Crawford Avenue Has Unusual Features**

AN EXPERIMENTAL installation of a boiler designed for an operating pressure of 1,200 lb. per square inch is to be made at the Calumet station of the Commonwealth Edison Company, Chicago. With it will be coupled a small extra-high-pressure turbine exhausting at 300 lb. pressure into the steam mains which supply the large turbines of the station. The turbine has not yet been ordered and the details of the system have not been completely worked out. The details of the boiler design, however, have been practically completed by the Babcock & Wilcox Company in conjunction with the consulting engineers of the Commonwealth Edison Company.

The unit will be of the inclined-header, cross-drum type and comprise a lower deck of 2-in. tubes in sections eight high, having a setting height of 25 ft. 9⅝ in., a primary and a secondary superheater in an interdeck space 8 ft. 1¼ in. between decks, an upper deck of seventeen-high sections of 2-in. tubes, horizontal 3¼-in. circulating tubes entering a 48-in. cross-drum, and a Babcock & Wilcox steel contraflow economizer. The lower deck will not be baffled, but the upper deck will have a vertical baffle, causing the gases to



SECTION THROUGH BOILER, SHOWING SECONDARY SUPERHEATER AND 4-IN.-THICK DRUM

make two passes. The complete unit is to be about 28 ft. wide and 36½ ft. deep, including the economizer, and 45 ft. high above the floor. The heating surfaces have not yet been definitely fixed, but they will be approximately as follows: Boiler, 15,750 sq.ft.; primary superheater, 2,120 sq.ft.; secondary superheater, 3,300 sq.ft.; economizer, 9,230 sq.ft.

The headers will have 1¼-in. thickness front and back and ⅝-in. sides, and are designed to give the tubes a stagger of nearly 4 in. The eight tubes in each section of the lower deck are to be expanded into nine-high headers, the tube space not filled being that next to the bottom. The mud drum is to be 7¼ in. square, 1 in. thick and extend through each side of the setting, with a flange for blow-off valves at each end.

The cross-drum is to be a forged-steel cylinder 48 in. in diameter and 4 in. thick, with integral drum heads, each with a manhole closed by a 12-in. x 16-in. manhole fitting. In order that the holes for connecting the circulating tubes to the drum may have the largest practicable ligaments between circumferential rows of holes, an unusual arrangement of connections has been adopted. At the top of each uptake header two horizontal circulators will be connected, but the circulators from each alternate header will be bent downward and sidewise so that they will be connected to the drum in the same circumferential row as the circulators without such bends. This will make the distance between these circumferential rows about 16 in.

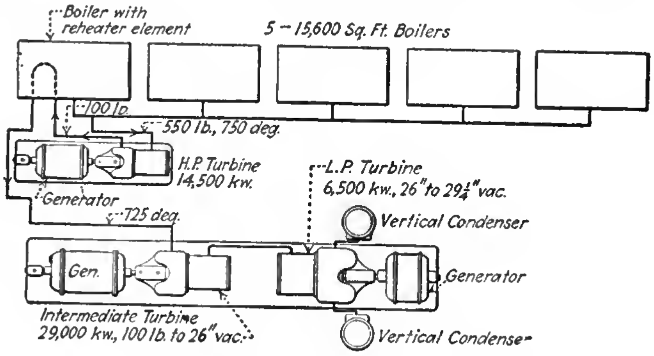
In the same way, the downtake nipples will not be straight, but bent so that two downtake headers will be connected to each of these circumferential rows of holes in the drum. The drum will have four 3-in. nozzles for safety valves, a 3-in. nozzle for the saturated-steam connection to the lower header of the primary superheater, and two 3-in. nozzles for connections to a feed pipe extending the length of the drum below the water line.

The primary superheater will have 8-in. headers drilled for three staggered rows of tube holes, with seventy-two tubes in each row. It is designed to raise the temperature of the steam under 1,200 lb. pressure to 750 deg. The secondary superheater has 11¾-in. headers drilled for four staggered rows of seventy-two tubes each. This secondary superheater incloses the primary superheater and is intended to raise the temperature of the exhaust from the extra-high-pressure turbine to 750 deg. The economizer will have forty-four rows of tubes.

## Arrangement of Parsons Turbine in Crawford Avenue

An unusual arrangement will characterize the 50,000-kw. unit which C. A. Parsons & Company of England are building for the new Crawford Avenue station of the Commonwealth Edison Company. This unit will consist of three turbines, a 14,500-kw. high-pressure element running at 1,800 r.p.m., a 29,000-kw. intermediate turbine running at 1,800 r.p.m. and a 6,500-kw. low-pressure turbine running at 720 r.p.m. Each will have its separate generator, but the intermediate and low-pressure turbines will be arranged in tandem on the same bedplate with the generators at either end.

Two other units, as previously stated in these columns, are already on order for this station, from the General Electric Company a 60,000-kw. cross-compound machine consisting of a high-pressure turbine running at 1,800 r.p.m. and a low-pressure turbine running at 1,200 r.p.m., each with its separate generator, and from the Westinghouse Electric & Manufacturing Company a cross-compound unit of 50,000-kw. capacity, consisting of a high-pressure turbine running at 1,800 r.p.m. and a low-pressure turbine at 1,200 r.p.m., each element with its own generator.*



ARRANGEMENT OF 50,000-KW. PARSONS UNIT

Instead of the usual arrangement all the turbines will be supplied with vertical condensers, two for each unit, these condensers standing alongside of the low-pressure cylinders. A steam pressure of 550 lb. and temperature of 750 deg. F. will be carried at the turbines. Provision will be made for reheating the steam at about 100 lb. pressure to a temperature of 725 deg. F.

The boilers for the Crawford Avenue plant will be of the Babcock & Wilcox high-pressure design, but will be built for a maximum working pressure of 650 lb. per sq.in. For each unit there will be five boilers, each with about 15,600 sq.ft. of steam-making surface, except that one boiler on each unit will be of special design and equipped with the interstage superheater.

*Adding the ratings of the three units under order by the Commonwealth Edison Company, a total of 160,000 kw. is found, which should be substituted for the 70,000 kva. given in the table on page 1231 of last week's issue. The figure given for Calumet—60,000 kva.—was also an underestimate, new equipment under order reaching 67,000 kw.

The Crawford Avenue station is being laid out for an ultimate rating of 500,000 kw. or possibly 600,000 kw.

## Electric Power Club Issues June Program

The program for the annual meeting of the Electric Power Club, to be held at The Homestead, Hot Springs, Va., on June 11-14, has just been issued. In addition to the section meetings and the usual reports from the officers and committees, C. L. Collens, 2d, will discuss the accomplishments of the Electrical Manufacturers' Council and tell what happened at the Geneva meeting of the International Electrotechnical Commission, A. M. MacCutcheon will deal with technical standardization, E. R. Harding with commercial standardization and A. H. Moore with Electrical Safety Conference activities. A. L. Ashby of the Westinghouse Electric & Manufacturing Company will make an address on "Contracts," and R. W. Gardner will speak on "Waste Prevention in Manufacturing."

At a dinner to be held on Tuesday evening F. M. Feiker of the McGraw-Hill Company will talk on "New Tasks for a Manufacturers' Association." Entertainment plans include golf tournaments, tennis, driving and riding, mountain climbing and dancing.

## Standardizing Pipe Joints

At an informal conference held in New York City last week between representatives of manufacturers and users of pipe flanges, engineers and others concerned, in the interest of standardization, a letter was read from C. F. Hirshfeld of the Detroit Edison Company, chairman of the prime movers committee of the National Electric Light Association, asking, on behalf of that association, that an agreement be reached for various pressures and temperatures covering allowable working stresses of different materials, gasket pressure, specifications for material and methods of testing, and the rational pressure for which standards should be specified.

Users of pipe fittings as well as manufacturers recommended that in standardizing fittings as few sizes be used as practicable. This means fewer patterns for the maker and fewer spare parts for the power plants. New standards appeared desirable. A method of reducing the number of standard fittings strongly advocated was to standardize the outside diameter of pipe for a given size and vary the internal diameter to suit pressure conditions. This would make one, or possibly two, standard flange diameters possible, from 250 lb. to 1,200 lb.

A motion was passed that pressure standards of 250, 400, 600, 800 and 1,200 lb. be recommended. The need of haste was emphasized, as in some cases fittings for 600 lb. and higher were being made with no official standards to follow.

## Electric Truck Show Will Be Held Convention Week

New York's annual electric truck show will be held in the Irving Place showroom of the New York Edison Company from June 2 to 9. More than twenty manufacturers of trucks and accessories have accepted the company's invitation to exhibit. A newcomer will be the Autocar Company. This company has just added an electric model to its line which will be exhibited for the first time at the truck show.

In the accessory exhibits will be shown new charging apparatus, which, according to Charles R. Skinner, Jr., manager of the automobile bureau of the New York Edison Company, will make the charging of electric truck batteries as simple a matter as connecting an electric flatiron.

An electric truck session forming part of the N. E. L. A. convention will be held at the Commodore Hotel on Monday afternoon, June 4. Among the speakers announced are E. S. Mansfield of Boston, who will report for the electric vehicle school committee; Charles S. Morris, past-president of the National Furniture Warehouse Association; Col. John Stilwell, general superintendent of transportation, Consolidated Gas Company, and William Van C. Brant of the Electric Storage Battery Company.

## Progress of Electric Arc Welding

At a recent meeting of the electric arc welding committee of the American Bureau of Welding, the sub-committee on arc welding of cast iron gave a description of hardness tests which had just been completed. These tests, carried out in accordance with a pre-arranged program, indicated that the hard zone exists in the cast iron near the junction line, not in the deposited metal.

The arc welding of non-ferrous metals was discussed, and a sub-committee with O. H. Eschholz of the Westinghouse Electric & Manufacturing Company as chairman was appointed to prepare a summary of the art to date and lay out a program of research. Specimens are to be welded by various companies and sent to Union College, Schenectady, for test.

Harold Ewertz was appointed to collect data and prepare a summary on the subject of the speed of welding and its effect on the weld. No definite program of investigation of the arc welding of thin-sheet metal was laid out, but R. E. Wagner was appointed to collect such data as could be obtained.

The subject of the application of arc welding to structural steel work was discussed, and it was decided that test specimens would be prepared by several welding companies and tested if possible at Union College. Specifications for these tests are to be prepared under the direction of H. M. Hobart.

# Brief News Notes

**Large Bushing for City of Seattle.**—The accompanying photograph shows what is probably the largest roof bushing ever manufactured. It weighs 2,600 lb., has an over-all length of, roughly, 17 ft. and is designed for a normal voltage of 187,000. It is one of four built by the Westinghouse Electric & Manufacturing Company for the Skagit River development of the city of

Seattle. Three of the bushings will be used for connecting a 165,000-volt bus line with a bank of three 10,000-kva., single-phase transformers, and the fourth will be used as a spare.

**Tirso River Reservoir Completed.**—Consul Russell reports from Rome that the hydro-electric reservoir on the Tirso River in Sardinia is completed and is now being filled. This artificial body of water will have an area of 19.305 square miles and will contain 460,000,000 cu.m. of water. It is calculated that this storage will produce 50,000,000 kw.-hr. of electrical energy for industries and will irrigate 74,000 acres of land.

**Insulator Tests at Purdue University.**—On May 15 and 16 insulator tests were carried out in the high-voltage laboratory of Purdue University, Lafayette, Ind., under the direction of Prof. C. F. Harding, head of the electrical engineering department. These tests were witnessed by engineers from Pittsburgh and New York City and also by Prof. H. B. Smith, head of the department of electrical engineering at Worcester Polytechnic Institute.

**Radio Monopoly in Great Britain Unpopular.**—The broadcasting monopoly in Great Britain has become so irksome to the public that a change of policy would cause no surprise, say recent advices reaching this country, particularly since the new Postmaster-General is apparently not in full sympathy with the plan. The control has been far from complete as evasions are known to be many. It is estimated that there are fully two hundred thousand unlicensed receiving sets in the British Isles.

**Bristow, Okla., Increasing Capacity.**—Owing to rapid increase in load, the Bristow substation of the Oklahoma Gas & Electric Company will again be enlarged. Three transformers rated at 500 kw. will replace others of 200-kw. capacity. This will require a rebuilding of the high-tension line now feeding the locality. The new line will have a voltage of 63,000. Three years ago the capacity of this substation consisted of three 75-kw. transformers, which served 340 consumers. The number of consumers is now 1,400.

**Fifty Iowa Cities Abandon Municipal Ownership.** — Fifty Iowa cities and towns which formerly had municipal electric lighting plants have abandoned them and are receiving their electrical energy from privately operated companies, according to records compiled by the Iowa Committee on Public Utility Information. There are fifty-eight cities and towns which have municipally owned distributing systems but which buy their energy wholesale from the lines of privately owned companies or from other towns, which have municipal lighting plants.

**Development on the Rio Grande.**—The Colorado and New Mexico Legislatures passed laws at their recent sessions authorizing the formation of a joint state commission to draft a compact between the two states relative to the use of water from the Rio Grande River. Governor Sweet of Colorado has appointed Delph E. Carpenter as the commissioner from Colorado. Mr. Carpenter favors the removal of embargoes placed on the use of the river water by the Department of the Interior to assure the rights of federal reclamation projects to the south.

**For Better Lighting in Mountain States.**—The local branch of the Association of Electragists International has established a lighting service bureau with headquarters at the office of the Rocky Mountain Electrical Co-operative League to promote better understanding and application of the best practice in lighting. The members of the bureau staff are E. A. Evans of the Westinghouse Lamp Company, Ernest L. Dee of the Edison Lamp Works and S. S. Stevens, representing the Bryan-Marsh Division of the National Lamp Works.

**New Library for Franklin Hall.**—The Electrical Engineering College of Cornell University has just been equipped with a library for the use of the students as a memorial to the late Prof. Alexander Gray, formerly its head. The McGraw-Hill Book Company purchased the books of Professor Gray after his death and gave them to the college. Along with this gift the company gave a copy of each of the tech-

nical books that it publishes. A classroom in Franklin Hall has now been set aside for their proper arrangement and access.

**Twelve-Hundred-Foot Submarine Cable Laid in Seven Minutes.**—The Northwestern Electric Company of Portland, Ore., recently laid a 1,200-ft., 250,000-circ.mil, 13,200-volt submarine cable across the Willamette River at Portland in the remarkable time of seven minutes. This was accomplished by laying one length of cable in a figure eight on the barge and splicing to this another length on a reel before the cable-laying operation was started. It was found preferable to use two tugs instead of one where the current of the river is swift because of the greater ease in controlling the barge.

**Electrical Spectacle Planned for Denver Exposition.**—Members of the electrical industry in Denver have taken preliminary steps to arrange for a spectacular electrical display at the "Pageant of Progress" to be held in that city in July and have called into consultation William D'Arcy Ryan, head of the illuminating laboratories of the General Electric Company. The Denver Electrical Co-operative League will handle the electrical end of the pageant, and all of the electrical men in the city will work through the league. The plans at present call for an iridescent color scheme of illumination throughout the exposition grounds.

**North American Company to Control Wisconsin Utility.**—The North American Company of New York has purchased nearly all of the capital stock of the Wisconsin Traction, Light, Heat & Power Company, which furnishes electric light and power, street-railway, interurban and gas service in the cities of Neenah, Menasha, New London, Bear Creek and Appleton, Wis. Most of the capital stock of the Wisconsin utility has been held by John I. Beggs and associated Milwaukee capitalists. No information was given out as to the price paid. No change in the management or operation of the property will result from the transfer.

**Northwestern Electric Company to Install Large Motor-Generator Set.**—An order has just been placed by the Northwestern Electric Company of Portland, Ore., for a 2,500-kw. motor-generator set consisting of one 3,600-hp., 11,000-volt, three-phase synchronous motor, directly connected to two 1,250-kw., 275-volt direct-current generators. The unit will operate at 720 r.p.m. It will be installed in the company's Pittock substation and will bring the total direct-current generating capacity up to 7,000 kw. The new machine is being built by the Westinghouse Electric & Manufacturing Company and will be, it is said, the largest motor-generator set of its kind on the Pacific Coast.

**Rural Service Projected by Tucson Company.**—A tentative offer to finance the construction of a hydro-electric power line that will bring cheap energy to the farming districts of Pima County, Ariz., and to sell the farmers power at 2½ cents per kilowatt-hour, has been made by the Federal Light & Traction Company of New York, parent company of the Tucson Gas, Electric Light & Traction Company. In making this proposal the president of the Federal company asserts that the company has no desire to make more than a fair return on an investment of this character, realizing the indirect benefit that will accrue to its city business by the greater development of agriculture in the neighborhood of Tucson.

**Contest Over Ownership of Former Municipal Plant in Indiana Town.**—A vigorously waged three-cornered utility contest is awaiting final decision from the Indiana Public Service Commission. Cambridge City (Ind.) voters decided recently that the municipal electric plant should be sold for private operation and at a public sale Robert Ashe bid $10 more than the Interstate Public Service Company. The city accepted Ashe's bid, and the transaction has come before the commission for approval, the Interstate filing a petition for a certificate of convenience and necessity with the commission and asking the right to intervene. The commission indicated that it would rule the Interstate had no right to intervene, but reserved decision on the question of which applicant should have the property.

**Holyoke Will Rebuild Municipal Plant.**—The Holyoke (Mass.) Gas & Electric Commission has decided to rebuild the municipal electric plant on its present site and abandon for the time being the project of a new site and a larger plant, for which a million-dollar bond issue was considered. The alternative plan of continuing the municipal plant at its present capacity and buying additional energy from the Holyoke Water Power Company or some other source did not command strong support. It is estimated that the arrangement decided on will take care of the department's business for the next five years. The commission has voted to accept the Holyoke Water Power Company's offer of a permanent connection between its plant and the city's. New waterwheels and turbines will be installed to meet the requirements of the department.

**Milwaukee Company Seeks to Acquire Waukesha Utility.**—The Wisconsin Gas & Electric Company, Racine, a subsidiary of the Milwaukee Electric Railway & Light Company, has applied to the Wisconsin Railroad Commission for authority to issue $400,000 of serial notes for the purpose of paying in part the purchase price of the electric and gas plants of the Waukesha Gas & Electric Company, which furnishes electricity for light and power purposes to a population of nearly 13,000. The plants of the company are about 25 miles from Milwaukee and 35 miles from Racine. At present the output of the steam plant of the Waukesha company is supplemented by energy from a high-tension transmission line from the Lakeside plant of the Milwaukee company. The Waukesha Gas & Electric Company is owned by the American Gas Company of Philadelphia.

# Associations and Societies

**Canadian Electrical Association.**—This association will hold its annual meeting in Montreal on June 21-23, and the convention committee announces an original feature in the shape of a "veterans' night," to be held on the evening of June 22. The minimum qualification for participation is twenty years in the electrical industry, but with this limitation a widespread invitation is extended to pioneers everywhere and many acceptances have already been received.

**Chicago Section, A. I. E. E.**—The development of vacuum tubes in power service was discussed on May 21 by Dr. A. W. Hull, General Electric Company, before a joint meeting of the Western Society of Engineers and the Chicago Section, A. I. E. E. He dwelt upon the fundamental characteristics of vacuum tubes, which he explained with slides. Dr. Hull also spoke of the 1,000-kw. power tube, but declared that some time would elapse before this tube could be standardized sufficiently to warrant its manufacture.

---

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

California State Association of Electrical Contractors and Dealers—Dorner Lake, Cal., June 9-16.

Electric Power Club—Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

North Central Division, N. E. L. A.—Minneapolis, June 20-22. H. E. Young, Minneapolis General Electric Company.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association—Montreal, June 21-23. Louis Kon, 65 McGill College Ave., Montreal.

American Institute of Electrical Engineers—Annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

American Society for Testing Materials—Atlantic City, June 25-29.

Iowa Section, N. E. L. A.—Mason City, June 26-29. M. A. Linn, Des Moines Electric Co., Des Moines.

Associated Manufacturers of Electrical Supplies—New London, Conn., June 26-29. Frederic Nicholas, 30 East 42d St., New York.

National Council Lighting Fixture Manufacturers—Buffalo, June 26-28. C. H. Hofrichter, 233 Gordon Square Bldg., Cleveland.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association—Cedar Point, July 10-13. D. L. Gaskill, Greenville.

New England Division, N. E. L. A.—Swampscott, Mass., Sept. 6-8. Miss O. A. Bursiel, 149 Tremont St., Boston.

Michigan Electric Light Association—Grand Rapids, Sept. 11-13. Herbert Silvester, Detroit Edison Co., Ann Arbor.

Rocky Mountain Division, N. E. L. A.—Glenwood Springs, Col., Sept. 17-19. O. A. Weller, 900 15th St., Denver.

Association of Iron and Steel Electrical Engineers—Buffalo, Sept. 24-28. J. F. Kelly, 513 Empire Bldg., Pittsburgh.

# Recent Court Decisions

**Powers of Tennessee Commission.**—The United States District Court for the Middle Division of Tennessee has held, in Cumberland Telephone & Telegraph Company vs. Railroad and Public Utilities Commission of Tennessee, that an order of the commission suspending increased rates for an indefinite period until the commission should determine the matter was invalid in so far as it suspended the rates for an indefinite period that might continue more than three months after the effective date of the increased rates, but was valid in so far as it suspended the increased rates for such three months' period. Where existing rates asserted by a public utility to be confiscatory have not been imposed on it by any act of the commission, but were voluntarily established by the utility itself with the approval of the commission, and the utility gives notice of an increase in rates, enforcement of an order of the commission suspending the increased rate pending a reasonable period of investigation will not be enjoined on the ground that the existing rates are confiscatory and in conflict with the United States Constitution. (281 Fed. 406.)*

**Three-Year Contract Between Utility and Consumer in Oklahoma Invalid and Cannot Be Validated by Commission.**—In Southern Oil Corporation vs. Yale Natural Gas Company the Supreme Court of Oklahoma has declared invalid a three-year contract by which the defendant agreed to sell and deliver its product at a specified rate to the plaintiff. The court found that rates so fixed were binding on neither party, the Corporation Commission having been established to determine rates of all public utilities, and that the commission could fix a different rate at any time. The fact that when the contract was first brought before the commission that body held that it did not establish discrimination, as claimed at that time by the oil corporation, was not tantamount to approval of the three-year rate by the commission, and its more recent order establishing a higher rate did not impair the obligation of a contract. The Corporation Commission, moreover, was not vested with the power to approve contracts, but was charged with the duty of fixing and establishing rates in the manner provided by law. (214 Pac. 131.)

**City Cannot by Inaction Continue Confiscatory Rates at Its Pleasure.**—In City of Wagner vs. South Dakota Light & Power Company the Supreme Court of South Dakota was called on to adjudicate an action for injunction brought by the plaintiff city against the defendant public service corporation to prevent it from charging rates for electricity in excess of the maximum rates specified in its franchise. The company, finding itself unable to continue service at existing rates without loss, sought permission to increase its charges, which was granted by all the cities on its lines except Wagner. That city did not controvert the company's assertion that it must have an increase in rates or discontinue its business. The Supreme Court sustained the Circuit Court in dissolving a temporary injunction obtained by the city, saying: "The issue on that question is simple. On the part of plaintiff we have the presumption that the franchise rates are reasonable. On the part of defendant we have the undisputed showing that they are unreasonable and confiscatory. A presumption cannot stand against such showing. The city contends that the franchise rates must be continued unless and until it changes them regardless of whether they are or are not confiscatory. Such is not the law. The city cannot by inaction and by refusal to adopt reasonable rates continue confiscatory rates in effect at its pleasure, and it matters not whether the question arises in an action brought by the city or in an action brought by the public service company." (193 N. W. 129.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Municipal Tax on Poles Condemned.**—An ordinance imposing upon a telephone utility a charge for each pole maintained in the streets of a city was declared by the Indiana Public Service Commission to be unlawful, unreasonable and void, in an instance where a municipality sought to impose such a tax on the Citizens' Independent Telephone Company. In addition to holding that the municipality had no power to impose such a burden the commission said: "It cannot be said that the question is of no moment because the taxes go to the municipality and the service is rendered to the people who live in the city, for the reason that the taxpaying public is a separate and distinct unit from the utility-using public receiving service from the petitioner. There are some taxpayers who are not patrons of the petitioner, and there are large taxpayers receiving only a small amount of service, and there are small taxpayers receiving a large amount of service from the utility. To permit a charge or tax of this kind would be to lift a burden which has been fixed by law upon the taxpaying public of the city and to place it upon the patrons of the petitioner, because such added burden would necessarily be reflected in the rates to be charged by petitioner. Before the days of regulation, when cities and towns had the absolute power to grant or refuse franchises, it was possible to affix to a franchise hard conditions which the utility must meet or be banished from the city or town, and these conditions were binding, not on the ground of regulation but on the basis of contract. When the franchise has been surrendered the conditions attached go out with the franchise and are no longer binding upon the utility."

**Steam-Heating Service from Electric Plant.**—Combating the prevailing opinion that the furnishing of central-station steam-heating service in conjunction with the generation of electric power is a function which involves practically no effort or expense on behalf of a central-station operator, and that such use of steam represents a use of something that would otherwise be wasted, the Public Utilities Commission of Michigan said, in fixing steam-heating rates for the Lapeer Gas-Electric Company: "The value and desirability of central-station steam heating does not develop from its cheapness, but from relieving the customer from the necessity of worrying over his coal supply, the stoking of his furnace, the removal of his ashes and the dirt and discomfort caused to him, his family or patrons by the presence of the individual heating plant in his residence or place of business. When accurate or approximate money values are placed on these various benefits, it is usually found that the central-station service is as cheap as, or cheaper than, isolated heating service with its attendant worries and discomforts. The electric power generating plant at Lapeer is a thoroughly modern installation of medium-pressure, high-speed engines operated condensing. Such operation secures nearly the greatest possible efficiency from the coal burned under the boilers that can be secured in a plant of such size. During the heating season, however, the condensing feature of the generating plant must be sacrificed in order to obtain steam at sufficient pressure to supply the heating customers. In sacrificing the condensing feature of operation the amount of coal required per kilowatt-hour of power generated is substantially increased, and the cost of generating the electric power is increased correspondingly. An analysis of the operating results during the various seasons of the year indicates that almost one-third of the coal consumed at Lapeer is consumed for the purpose of providing steam for the heating service. In other words, if no heating service were furnished, one-third less coal would be needed than actually has been consumed in the past years. In addition, boiler-house labor must necessarily be higher with this steam-heating coal to be handled than would be required to handle electric generation only. . . . Probably the total collections from heating customers have been less than the fair and reasonable expenditures necessary in rendering the service. The resulting deficit has been borne by the lighting and power customers, many of whom are not heating customers."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## Julian C. Smith Heads Quebec Company

Julian C. Smith, who has been elected president of the Quebec Railway, Light, Heat & Power Company, as was announced in the May 26 issue of the ELECTRICAL WORLD, has been a prominent figure in Canadian hydro-electric developments during the past few years. Besides occupying the chief executive office of the Quebec company, Mr. Smith is vice-president and general manager of the Shawinigan Water & Power Company of Montreal, president

International Press Service
J. C. SMITH

of the Public Service Corporation, Quebec; president of the Canada Carbide Company, vice-president of the Dominion Engineering Works, Ltd.; director of the Dominion Bridge Company and president of the Canadian Electro-Products Company and North Shore Power Company, Three Rivers, Quebec.

Mr. Smith was born in Elmira, N. Y., in 1878 and was graduated from Cornell University in 1900. He began his business career as draftsman with Wallace C. Johnson, consulting engineer at Niagara Falls, N. Y., and later went to Shawinigan Falls, Quebec, as assistant engineer to Mr. Johnson. In 1903 he allied himself with the Shawinigan Water & Power Company as superintendent and three years later was advanced to general superintendent. Subsequently he became general superintendent and chief engineer, and in 1913 he was made vice-president. At present, in addition to his position as vice-president and general manager of the Shawinigan company, he is executive of all subsidiary companies. Mr. Smith has taken an active interest in engineering societies—American, Canadian and British—and has made many important contributions to technical literature. Interests which are identified with the Shawinigan company have recently acquired control of the Quebec company. Several of the old directors of the latter resigned, and their places were filled by officials representing the Shawinigan company. .

**E. W. Robinson**, formerly assistant chief engineer of the E. W. Clarke & Company Management Corporation at Columbus, Ohio, has joined the Alabama Power Company, Birmingham, in the capacity of assistant superintendent of distribution.

**A. H. Kendall**, master mechanic of the Quebec district of the Canadian Pacific Railway, has resigned to become manager of the Chicoutimi Pulp Company, the Saguenay Light & Power Company and the Roberval & Saguenay Railway Company, Chicoutimi, Que.

**Frederick H. Hill**, vice-president and general manager of the Elmira Water, Light & Railroad Company, completed ten years of service with the company on May 12, when he was presented by his associates with a silver service. Three hundred employees attended the dinner which preceded the presentation.

**N. I. Garrison**, manager of the El Reno division of the Oklahoma Gas & Electric Company, has been appointed manager of the southern division of the company, with headquarters at Ada, Okla. J. T. Naylon, from the commercial department of the Oklahoma City division, succeeds Mr. Garrison as manager at El Reno.

**John T. Sharp, Jr.**, for several years superintendent of the Canton (Miss.) Light & Water Works Plant, tendered his resignation on May 1 to take effect as soon after May 15 as possible to accept a position as manager of the Helena (Ark.) Gas & Electric Company. The Helena property is owned by the Arkansas Utilities Company.

**F. F. Winfree**, electrical engineer at the head offices of the Mountain States Power Company, Albany, Ore., has assumed control of the Eugene office. Mr. Winfree is taking the place of Fred Brown, who leaves for Tacoma, Wash., and will be stationed in Eugene only until a resident engineer can be obtained to take charge of the company's properties in Lane County.

**W. H. Damon** of Madison nas been appointed to succeed E. J. Steinberg, whose resignation became effective June 1, as resident engineer in Milwaukee for the Wisconsin Railroad Commission. Mr. Damon has been with the Railroad Commission for approximately ten years and served as resident inspector in both the Eau Claire and Appleton districts prior to his promotion to his present position at Madison. His work in Milwaukee will consist largely of investigations of the service of the electric, street-railway, gas and telephone utilities.

## Eugene B. Criddle Vice-President Southern Sierras

Eugene B. Criddle, who was made a vice-president of the Southern Sierras Power Company at a recent meeting of the board of directors, as was announced in the May 5 issue of the ELECTRICAL WORLD, entered the public utility field in 1911, when he became associated with the Nevada-California Power Company and the Southern Sierras Power Company. After serving as manager of the northern district for two years he was made general agent of these companies with headquarters at Riverside, Cal. He con-

E. B. CRIDDLE

tinued in this capacity until the promotion just referred to. Before engaging in utility work Mr. Criddle spent some time in managerial positions with industrial concerns and gained an extensive training in drafting, railroad rate making and shop work.

**H. W. Watt**, electrical engineer of the Westchester Lighting Company, Mount Vernon, N. Y., was elected vice-chairman of the electrical section of the Empire State Gas & Electric Association at its meeting in Utica on May 18. He had previously been chairman of the overhead-distribution committee. Mr. Watt has been connected with the Westchester company for about fifteen years.

**Frank D. Fagan**, vice-president and general manager of the Edison Storage Battery Company for the past three years, has been selected to go on a special mission to Japan for the International General Electric Company. Mr. Fagan has risen from the ranks of the General Electric Company and is the originator of many remarkable ideas in connection with the sale of incandescent lamps. He sailed on May 17.

### Eric A. Lof Leaves Schenectady

Eric A. Lof, who since 1909 has been connected with the power and mining engineering department of the General Electric Company as industrial engineer and specialist, has resigned to take up work with the American Cyanamid Company, one of the Duke interests. He will have important tasks in connection with the electrochemical projects that form part of the large water-power developments now in progress on the Saguenay River above Quebec, Canada. His headquarters are in New York City, and he assumed his new duties on June 1.

Mr. Lof became associated with the General Electric Company in 1909 when the power-apparatus section of the Western Electric Company, with which he was connected, was taken over by the first-named company. He spent several months in Europe two years ago for the International General Electric Company, partly in connection with the extensive power transmission and railway electrification projects in Sweden and Norway. About a year ago the Royal Order of Vasa was conferred on him by the King of Sweden in recognition of services rendered to the Swedish government. He is well known to the engineering profession through his many contributions to the technical press, his frequent lectures on various subjects and as the author of several books.

**P. T. Sealey**, formerly superintendent of power for the Potomac Public Service Company, Hagerstown, Md., is now superintendent of the Southern Utilities Company, Palatka, Fla.

**Jason C. Leighton** of the Boston office of Stone & Webster, Inc., has been made vice-president of the El Paso (Tex.) Electric Company to succeed Donald C. Jewett.

**C. E. Brenton** has been appointed general manager of the Missouri Public Utilities Company, St. Louis, having charge of the operations of the properties which have been leased to the Union Electric Light & Power Company of the same city.

**Walter Byrne**, who has been sales manager of the Nebraska Power Company since 1919, has resigned to become assistant treasurer of the Thomas Kilpatrick Company. Kenneth Goewey, who has been closely associated with Mr. Byrne in the sales department, has succeeded him as sales manager. Mr. Goewey joined the Nebraska Power Company in 1917 as a heating specialist from the research laboratories of the General Electric Company. Previous to his association with that company he was with the Milwaukee Electric Railway & Light Company.

**L. L. Price**, who for the past three years has been manager of the gas and electric appliance department of the Winnipeg (Manitoba) Electric Railway Company, has just been appointed superintendent of distribution and sales, including the sale of all by-products. While this new position involves large responsibility, Mr. Price will still maintain charge of the appliance department. He is well qualified for the responsibilities of his new office, having had seventeen years' practical experience in utility accounting, office management, shop, distribution and merchandising of gas and electric appliances.

### J. H. Gill Heads Southern Association

Joe H. Gill, who was elected president of the Southwestern Public Service Association on May 17 at the annual convention of the association at Fort Worth, Tex., is assistant general manager of the Dallas Power & Light Company and is one of the younger men in Texas who have risen rapidly in the electrical industry. Mr. Gill was born at Kerrville, Tex., in 1886 and was graduated from the University of Texas in 1910 with the degree of electrical engineer. After receiving his degree from the university he joined the forces of the General Electric Company at Schenectady, N. Y., and remained with this company until 1912. Subsequently he allied himself with the Texas Power & Light Company of Dallas, where he served first as resident engineer in charge of transmission-line and distribution-line construction and later as supervisor of transmission lines in entire charge of all construction of this character undertaken by the company.

J. H. GILL

Mr. Gill was with Stone & Webster from October, 1917, to April, 1918, as electrical engineer on design of the American ordnance base depot in France, and in April, 1918, he enlisted in the United States Army. When his service was over he returned to Dallas, entering the employ of the Dallas Power & Light Company as power salesman on Feb. 1, 1919. He has been successively power salesman, chief engineer and assistant to the general manager and is at present assistant general manager. Mr. Gill is a member of the University Club and of the Technical Club of Dallas and president of the Electrical Club.

**R. A. Haigh** has been appointed sales manager of the Paducah (Ky.) Electric Company to fill the vacancy resulting from the transfer of R. A. Gordon to Pawtucket, R. I.

**M. H. Hallenbeck**, for the past six years a power engineer specializing in applications of electricity to the paper industry on the staff of the Westinghouse Electric & Manufacturing Company at East Pittsburgh and Boston, has opened offices as consulting engineer in the latter city.

**Elbert G. Allen**, formerly chief engineer of the Philadelphia Rapid Transit Company, is now in the Boston office of Stone & Webster, Inc., as consulting engineer. Mr. Allen returns to the Stone & Webster organization after about twenty years of service in its engineering activities, embracing electrical interests in many parts of the country.

**Henry C. Peeples**, formerly with the Puget Sound Power & Light Company and for several years attached to the engineering department of the Stone & Webster division of construction and engineering, and until recently connected with the Wenatchee extension, has gone to Indianapolis, where he will be engaged on the construction of a 75-mile steel-tower line between Indianapolis and Terre Haute.

## Obituary

**Charles Sigel, Jr.**, of the Nevada-California Electric Company and president of the Sigel Manufacturing Company of Denver, is dead, aged seventy-eight. Mr. Sigel was born in Hamburg, N. Y., and was for many years in the leather industry there.

**Edwin F. Davis**, formerly state electrician for twenty-five years and co-inventor of the Sing Sing electric chair with Harry L. Tyler of New York, died at his home in Corning, N. Y., on Saturday, May 26. Mr. Davis retired five years ago to return to his home in Corning.

**William Jones**, who had been a director of the Pacific Power & Light Company since its organization in 1910, died recently at his home on American Lake, near Tacoma, Wash. Mr. Jones was also president of the Cordova (Alaska) Light & Power Company and had been connected with a number of other companies. He was born in Stratford, Ontario, and was sixty-eight years of age.

**Dr. Hans Goldschmidt**, inventor of the Thermit process for welding iron and steel and for producing high-grade metals and alloys and originator of many other scientific inventions, died suddenly in Baden-Baden, Germany, on May 20, after a stroke. Dr. Goldschmidt visited this country frequently and was president of the Goldschmidt Thermit Company, now the Metal & Thermit Corporation, from 1904 to 1916.

# Manufacturing and Markets

Devoted to the Discussion of Business and Economic Problems of the Producer and Distributor, with Market Reports, Trade Activities, Foreign and Construction News

## Action Needed to Prevent More Inflation

### A Discussion of the Dangerous Drift of Advancing Prices—An Appeal for Active Propaganda to Safeguard Our Industry

By J. H. Fall, Jr.
Treasurer Benjamin Electric Manufacturing Company, Chicago

THE time apparently has come when manufacturers in the electrical and other industries should seriously consider and discuss what steps may be taken to nurture the widespread business activity now in existence. It is also imperative that steps be taken to initiate propaganda, so that in the event of a reaction setting in we may head off a repetition of the disastrous losses manufacturers were forced to assume by reason of wild cancellations in 1920 and 1921 respectively.

#### General Conditions Are Unsatisfactory

Renewed activity has brought with it increased expense of manufacture, which of necessity has forced the price of goods up. But in my judgment the advances in many lines have been too rapid and more than expense conditions warranted, and as a result the price level at the present time is on a basis which the most conservative thinkers regard as a secondary period of inflation.

As far as it is possible to analyze the general condition, stocks of material in the hands of distributors are light, for the reason that manufacturers had no large stock of finished goods on hand when the present activity started. Therefore orders accumulated more rapidly than it was possible to manufacture and deliver.

This has reacted in all directions, resulting in congestion, a situation not unlike that obtaining in the spring of 1920. For it will be remembered that in the fall of that year, when the bubble burst, manufacturers not only had tremendous amounts of money tied up in goods in process of manufacture, but in addition thereto were committed to the purchase of material several months ahead against accumulated orders on hand.

Almost over night a great mass of buyers apparently lost all sense of moral responsibility, cancellations became rampant, prices tumbled, manufacturers were forced to assume terrific losses. And all of this could have been in large measure avoided if each buyer had been willing to assume his particular responsibility.

A repetition of this situation should not again be permitted by manufacturers in the event that another reaction sets in from the present nation-wide activity. Yet one will almost certainly be precipitated unless the large and basic corporations which have been so boldly announcing wage and price advances face about and change their policy by contributing something constructive to prevent prices from going higher and if possible stabilize them where they are.

#### Price Advances Dangerous

It is the opinion of the largest bankers and of the ablest leaders in the electrical industry that this price advance has been entirely too rapid and has become obnoxious. The steel corporation a few weeks ago made an announcement through the public press of a wage advance. This was followed by the packers and other basic industries with price advances in one form or another. These mean just further contributions to the vicious circle of wages followed by price advance, all of which, if something is not done, may result in the end in another smash similar to that of 1920.

What these people hope to gain heaven only knows, for we, their customers, do not. We do know this, however, that signs of hesitancy on the part of buyers are already appearing and appearing rapidly, and unless this policy is changed and prices are held at April 1 levels, we are all riding for a fall, and with it will be accomplished the death of "the goose that lays the golden egg."

I believe in all earnestness that the business men of America should register an objection to such price advances and appeal for a general announcement from manufacturers of these basic products that prices will remain firm at the April 1 level with no advance or decline contemplated for the rest of 1923.

In our judgment, this will contribute more toward a steadying of the present uncertainty than anything else. The General Electric Company recently reduced the price of some of its products 10 per cent as a contributing effort along this line.

#### Propaganda Needed

In so far as the electrical industry is concerned the writer feels that propaganda should be initiated over the signature of the Associated Manufacturers of Electrical Supplies as an organization to build public confidence that further price advances need not be feared and to impress upon manufacturers that every effort will be made to stabilize prices and that no orders will be accepted subject to cancellation.

Customers should be notified and articles should appear in the various trade journals advising buyers of electrical material that cancellations should not and will not be accepted by electrical manufacturers, as was the case in 1920, without proper indemnity against loss. This should include depreciation in the price of materials on hand or in process of manufacture and yet undelivered which have been purchased in good faith by manufacturers against orders on hand.

If this vicious circle of advance is permitted to go ahead unchecked, there can be only one result, a smash-up with a period of depression following. Surely, therefore, it is worth while making every possible effort to prevent it, and I believe that if propaganda along the general lines suggested above could be "put across" to every dealer, wholesaler and retailer alike, it would be

an exceedingly wholesome thing. The consumer would understand clearly, when a purchase was made, that the goods would have to be taken, the dealer in buying from his jobber would clearly understand the same thing, as would also the jobber with respect to purchases made from the manufacturer. In a nutshell the whole thought in the matter is simply this, that if manufacturers are to be saved from tremendous losses, in the event of another depression, it should be guarded against now by organized propaganda, which should be steadily supported by all manufacturers until the danger mark has been passed.

## Who Should Pay the Cost of Improvement?

**A Discussion of the Question Whether Code Changes Should Be Postponed to Suit the Convenience of the Manufacturer**

BY KASSANDRA

WHENEVER an improvement or an invention is made there are two sets of costs involved. The first and most obvious is the labor of the inventor and of the people who develop the improvement and put it in use. These costs, of course, are paid by the people who use the improvement. It would not be an improvement unless it could be sold at a price such as to pay these costs, or rather no one would work to make an improvement unless he anticipated that he could collect his costs from the user and that the latter would most willingly pay them out of the savings effected as compared with the old methods.

In addition to these obvious costs of making an improvement, there is another set of costs—those involved in scrapping the goods or material made under the old methods. When railroads were introduced stagecoaches became of less value. When turbines came into use the value of reciprocating engines decreased. When cloth came to be spun and woven by machinery the skill of the old hand workers did not earn the wages for them that it had formerly earned. These costs of an improvement are like growing pains. The community suffers from them, but it does not want to sit still and make no advance merely because improvements involve costs which in the beginning are an evil.

Now, there are two ways to handle these costs of the second class. One is the normal and ordinary way. Every one when building a machine or acquiring a trade understands that there is a certain risk, that the machine may become antiquated before it is worn out, and that it may even become antiquated before it is put into service. This is the ordinary risk of business just as if a man buys an automobile for a given price and later the manufacturer cuts that price. The man who bought some time ago at the higher price does not expect to be able to sell out at a price based on what he paid. He can sell only at a price based on the market.

If a man builds an office building when the prices of building material are high, and then later a competing office building is put up at low prices, the rents will be the same irrespective of the original cost. This is the normal and ordinary course in case of any change or improvement.

### PROGRESS NOT TO BE POSTPONED

Now, however, it is being suggested that in the case of certain changes and improvements—namely, those in the National Electrical Code—those who have stocks on hand should not only be allowed to dispose of these as they see fit, but, further, that no one should be allowed to use the improvements until the old and inferior stocks have been sold off without any competition from material conforming with the better methods. This would almost correspond to a suggestion that nobody should have been allowed to ride in railroads until the stage coaches had worn out.

The idea that the use of an improvement must be postponed merely for the benefit of the people who have made goods or have acquired skill under the old methods would seem to be a very dangerous one to put into effect. To do so would seem to put an entirely unfair burden on the user, who would like to use the improvement as soon as it is made. Why should he be asked to pay for all this cost, when the user who is willing to postpone buying for a few months is to have the full benefit of the improvement contemplated?

The municipal and other inspectors who pass on safety should not go outside of their province to determine who should and who should not pay the cost of improvements. Their province is merely the province of safety. The payment of costs should be left to the normal and natural course of business.

## Further Waste Inexcusable

**Experience Plus Jobbers' Cost Study Proves Importance of Discarding Excess Lines**

BY W. E. ROBERTSON

Robertson Cataract Electric Company, Buffalo, N. Y.

THE avenue of hope to realize a reasonable return on the investment in our branch of the industry lies in close analytical study of the possibility of reducing the excess varieties of stock now manufactured and carried. More real progress toward better conditions is to be found in that way than in any other single thing we can do.

The creation of demand for special shapes and sizes of articles that vary but slightly from generally accepted standards and the stocking of these articles, while questionable in the past, will be an inexcusable waste if continued in the future, now that we are realizing what it is costing the industry and the insignificant value of the service thus rendered. We have made one of the most exhaustive studies of this question that has ever been made in the history of the jobbing industry, and while this study was carried on in 1921 at the expense of the jobbers' association, it has been continued, for comparative purposes, at our own expense during 1922. We intend to give the benefit of these studies, and our conclusions, to the trade, and we intend as a matter of practice, so far as our company is concerned, either to eliminate from our stock the articles that are substantial duplicates of standard articles, and also to eliminate articles that are likely to become obsolete in a short time, or else to charge enough for articles of this kind to repay us amply for having them on our shelves to serve the occasional demand.

If we can neither eliminate nor get a satisfactory price for the articles we sell, we will eliminate the line in its entirety and confine our efforts to those things that will yield a profit, even if it takes us as far afield as the sale of spaghetti or shoestrings. We are not in business for our health, but to make a net profit on the investment intrusted to us, and we do not intend to ruin our health fighting impossible conditions, once we understand the facts.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

ORDERS to manufacturers are in more wholesome volume than three weeks ago, say several leading authorities, and general business of the industry has a more favorable outlook for the coming summer months than was the case a year ago. Business in small motors, appliances and wiring devices is much improved throughout the country. Lamp sales at the present time are known to be enormous.

Sales of transmission material are reported as only fair, owing to a lull started in the line extensions by utilities three weeks ago. Stocks of poles are plentiful in all parts of the country.

Wire and rigid conduit stocks are much improved, and there is little trouble being experienced in filling orders.

The fixture, radio, signal apparatus and transformer markets have shown a slight falling off during the past week.

## General Business Horizon Becomes Brighter

THE past week has brought about a change in sentiment in many lines of industries, and "more disposition has been shown in different quarters this week to stress the favorable aspects of the business situation," according to *Dun's Review*. "While commercial activities have lately abated, both production and consumption of goods continue to be of large volume in the aggregate," add the paper, "and the fact that speculative excesses are still being discouraged is considered reassuring.

"The prevailing policy now, as it has been for a long time past, is one of conservatism, and there has been plain evidence that the heavy transactions of recent months have been based mainly on actual requirements. Despite reports of some cancellations of contracts, no indication exists that this condition has developed generally, the bulk of the merchandise ordered being taken promptly by most purchasers. Returns of car loadings testify each week to the remarkable magnitude of the freight movement on the railroads, new maximums for the season being regularly established, and various other statistical measures show that operations remain on an active scale in many instances. With many needs already provided for, however, some contraction of new demand at present is not unnatural, and the approach of summer usually is accompanied by a slackening of work both in mercantile and industrial channels.

"In the building field, as at certain manufacturing centers, labor troubles have begun to impose restraint on progress and to restrict the public buying power. The backward weather, moreover, has prevented a full development of retail trade and signs of price concessions at the counters have not been lacking."

## Well-Sustained Demand for Control Apparatus in Varied Fields

ALTHOUGH inquiries for control apparatus have diminished slightly as compared with the peak business of March, manufacturers of this class of equipment are extremely busy filling orders and are receiving a very healthy volume of new trade. In the rubber-manufacturing industry business has been particularly good for control makers, and the printing industry has bulked large in recent requisitions. Late developments along the line of providing automatic control for certain processes in series in textile production have brought an increasing business to producers of electrical control equipment.

A revival of purchasing in the industrial electric truck, tractor and electric road-truck fields has led to the placing of numerous orders for charging panels and auxiliary apparatus, some of these running into scores of units. At the factories raw materials are being kept well in line with demands, labor is well employed and none too plentiful, and deliveries are keeping well ahead of motor shipments except where delays occur through the failure of buyers or their engineers to furnish the control-equipment maker with complete field data. Prices of control equipment now seem steady after a recent advance of 10 per cent in accord with the upward swing in motor prices.

## Conditions in Eastern Section Show Little Change

CONDITIONS in the Eastern section show little change in the electrical field during the past week, barring a tendency toward a reduced volume of business which is enabling jobbers and manufacturers to catch up somewhat on deliveries and to replenish low stocks. In most lines stocks are now in excellent volume and sizes are well assorted. Some difficulty is still reported in getting porcelain into this territory.

Recent shortages in rigid conduit are for the time being a thing of the past, and some jobbers are so well stocked that they are buying very conservatively. Less and less danger of inflation appears to be evident, and, on the other hand, opinions favor a continuance of good business for many months.

In the telephone field new construction is extremely active, and central-station extensions continue at a good pace. Labor troubles in the leather industry are causing some disquiet in this district, and some uncertainty surrounds the telephone labor situation, in view of the refusal of a New England company to grant increased wages and a seven-hour day at its operators' recent demand.

Machinery agents are handling an excellent volume of business; the electrical appliance trade is very active for this season, and house wiring is being done on a large scale.

## Wider Use of Electricity Is Shown in Japan

PROGRESS of electrification in business, industry and home in the Orient seems to be directly dependent upon the stability of government and the faith in the government that big business interests have, according to C. G. Schluederberg of the Westinghouse Electric & Manufacturing Company, who has just returned from a six months' business survey of the Far East in the interests of the merchandising, supply and industrial departments of his company.

Japan is highly electrified and from the survey made by Mr. Schluederberg is rapidly approaching the highly specialized use of electricity to which Americans are now accustomed. The country is very widely covered with a network of high-tension lines that extend from city to city and thus afford the Japanese opportunity for all applications of electricity.

In home life especially is the Japanese beginning to find wider use for electricity. The average Japanese in absorbing Western civilization is finding an increasing dislike for cold houses, and as the houses are of wood lightly constructed, and the doors, windows and walls are only framework, covered with paper in many cases, they are exceedingly cold in winter if no artificial heating method is installed. Formerly the only heating appliance the natives had was a sort of charcoal stove on which the meals were cooked and a few small portable crocks or braziers called "hibachis" in which a little charcoal glowed. These are beginning to disappear and electric heaters and cooking appliances are taking their places.

Another reason for the rapid conversion of Japanese to electrical domestic appliances is the increase in wages demanded by the workers and household servants. For this reason the electric washer, ironer, heating appliances such as irons, hotplates, table stoves, etc., and fans have taken the place of many picturesque servants.

So completely are the cities wired that even the street peddlers, somewhat on the order of our own, except that they have stands along certain streets during the evening hours, have electric lights hanging in front of their carts or above their wares as spread along the edge of the sidewalk.

Street lighting is a problem that Japan will have to deal with just as has

America. Her street lighting in the larger cities is only fairly well taken care of. Although there are none of the great white ways of the many American metropolises, Japanese cities have well-illuminated business streets, largely on account of the store fronts, which, brilliantly lighted at night, add materially to the street-lighting installations, and as it is customary for the Japanese stores to remain open quite late the business thoroughfares at least compare favorably in illumination with those of America.

### Appliances Are Quite Slow in Pacific Coast Territory

MAY construction in the Pacific Coast territory was very brisk. Monthly building totals all through California exceed the corresponding 1922 totals by 20 per cent to 50 per cent. Electrical stocks are lower than for several months. Rail freight rates are expected to drop soon, a recent conduit carload rate drop of about 10 per cent being taken as fairly indicative.

Appliance business is quite slow except for the extraordinary call for household irons. Radio business has decreased in volume but is being satisfactorily renovated for an encouraging future. The wire market is unsteady, rubber-covered having fluctuated from a 5 per cent advance to a 10 per cent drop in certain sizes and lamp cord and weatherproof having dropped rather sharply.

### Tape Market Active with Unsettled Prices

FULL-TIME factory operation, cautious buying by jobbers and considerable uncertainty in price movements characterize the friction tape market at present. In manufacturing circles it is reported that up to Jan. 1 orders were being received at a rate which was breaking all records, and production by strenuous exertions only was keeping pace with demand.

The large volume of business being handled attracted new producers into the field, and in the trade it is a frequent topic of discussion how these later entrants can conduct a successful business on the basis of price cuts which the older manufacturers have been encountering. In one instance a manufacturer quoted on tape on a basis of sheeting costs around 9 cents per unit, whereas this raw material was then actually upon a 14-cent cost basis. When the discrepancy was called to his attention surprise was expressed and some recognition given to the importance of more accurate factory accounting and a closer co-ordination between the production and sales functions of the concern. During the past week both rubber and sheeting have fallen off slightly in price, and this has been reflected in immediate inquiries of the manufacturers from large purchasing agents as to the possibility of corresponding reductions in tape quotations. Incidentally, labor has just been advanced about 10 per cent in wages.

In manufacturing quarters there is a widespread desire for price stabilization. Well-informed opinion is to the effect that rigid prices are undesirable in the face of fluctuating costs, both fixed and operating, but representative sales managers feel that purchasers should take more account of the time interval between raw-material price changes and the utilization of such material in the factory, and that a reasonable allowance should be given to the accumulation of stocks of raw material at high prices in order to render good service to the industry. If cotton drops on the exchange, some purchasing agents at once expect reductions in tape quotations, not realizing apparently that the tape manufacturer cannot immediately begin to fabricate his product with the lower cost raw material. Prices are responsive in time to these changes in basic commodity quotations. Perhaps even more important is the question of recognizing quality in purchasing material of the tape class. The idea is that "tape is tape" still persists among buyers, and both laboratory and service tests discount this view as most inaccurate and deserving of modification in practice.

### Eastern Manufacturer Comments on Western Co-operation

"THE wonderful spirit of co-operation among electrical men is the thing that has impressed me most on my Western business trip," said J. H. Parker, porcelain manufacturer of Parkesburg, Pa., to a representative of the ELECTRICAL WORLD, while in San Francisco recently. "Not only is this spirit evident at the various gatherings of electrical men which I have attended, but I find that the men carry it with them to their offices and manifest it in their business relations with each other. I cannot help being impressed with the building activity and the hydro-electric development that one sees on every hand in all parts of the West."

Commenting on the present upward trend of prices, Mr. Parker said: "Eastern manufacturers are making a concerted effort to forestall another period of inflation by suspending all buying for a period of ninety days. If manufacturers will avoid raising prices more than just enough to cover the increase in cost of raw materials and labor and the buyer will assist in preventing the pyramiding of orders, we shall come out of the present situation without any serious harm."

### Slowing Up of Business Reported for Chicago Market

RUMORS of impending building-trade strikes about June 1 have caused a slackening of trade. While building permits still exceed those issued last year, the same number of buildings are not being started. This would seem to indicate that conditions are not normal, a fact due to the forthcoming labor troubles. Fourteen trades were granted an increased scale of wages under the Landis award.

A few reductions of list prices in certain types of meters were announced this week. No advances were announced, and several firms are again quoting firm prices on conduit, although deliveries apparently are lengthening out. Pole-line hardware demand is up to its last week's standard. Numerous high-tension equipment sales have been made this week. The demand for radio material is consistent with this time of the year. One firm announced a reduction of list prices on several of its larger units. Hollow-ware sales are keeping up; buying is normal.

### The Metal Market

COPPER ended the week about one-quarter of a cent under the previous week's close. Producers were openly naming 15.37½ cents delivered, and buyers were confident they could obtain the metal at 15.25 cents delivered, but at the same time were not anxious to try. Some producers are not naming under 15.50 cents, which is equivalent to being out of the market.

The official contract price of the American Smelting & Refining Company continues at 7.25 cents, New York. The new level of price seems to be satisfactory to producer and consumer alike, and there is no immediate likelihood of a change unless something unforeseen happens in London. Prices there are about on a New York parity, making an allowance for freight and duty. Sales have been made in much better volume during the last week, mostly for June and early July delivery at the 7.25-cent level.

NEW YORK METAL MARKET PRICES

| | May 23, 1923 Cents per Pound | May 29, 1923 Cents per Pound |
|---|---|---|
| Copper, Electrolytic | 15.75 | 15.25 |
| Lead, Am.S.& R.price | 7.25 | 7.25 |
| Antimony | 8.00 | 8.00 |
| Nickel, ingot | 28.00 to 30.00 | 28.00 to 31.00 |
| Zinc, spot | 6.60 | 6.60 |
| Tin, Straits | 43.00 | 43.00 |
| Aluminum, 98 to 99 per cent | 26.00 to 27.00 | 26.00 |

### Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | $0.034 | $0.0326 | $0.0236 |
| Cold finished shafting, per lb. | 0.042 | 0.0406 | 0.032 |
| Brass rods, per lb. | 0.1850 | 0.1913 | 0.1466 |
| Solder (half and half), per lb. | 0.2862 | 0.30 | 0.21 |
| Cotton waste, per lb. | 0.1231 | 0.1231 | 0.104 |
| Washers, cast iron (½-in.), per 100 lb. | 4.66 | 4.66 | 4.00 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 2.96 | 3.17 |
| Machine oil, per gal. | 0.349 | 0.349 | 0.40 |
| Belting, leather, medium, off list | 42% | 42% | 48¼% |
| Machine bolts, up to 1-in. x 30-in., off list | 44¼% | 44¼% | 62¼% |

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Allis-Chalmers Unfilled Orders

The Allis-Chalmers Manufacturing Company, Milwaukee, reports that orders were slower in all departments during May, in line with what officials state is a trade decline for the products they manufacture throughout the market. The company gained $1,000,000 in unfilled orders on May 1, with a total of $12,590,000, compared with $11,570,000 on April 1.

The company had averaged a net gain in unfilled orders of $1,000,000 a month in 1923 up to May 1, but this ratio is not expected to be maintained on June 1. The company is still taking on additional employees to cope with the large increase in orders during the first four months of the year.

## Surgical Instrument Maker Enters Electric Tool Line

The Bard-Parker Company, 37 East Twenty-eighth Street, New York City, manufacturer of surgical knives with detachable blades, has entered the electrical market with a recently perfected wire insulation-stripper. The basic patent for this tool was bought from the Wood interests, manufacturers of the "Wood stripper."

Production facilities at the company's plant at 150 Lafayette Street, New York City, allows for 4,000 insulation strippers monthly, which production is being maintained in order to fill orders already received. The company plans to enlarge its line with other tools for the electrical industry. Morgan Parker is president and Charles R. Bard is secretary and treasurer.

## Wetmore-Savage New Additions Will Soon Be Completed

The Wetmore-Savage Company, electrical jobber, 74 Pearl Street, Boston, will soon complete alterations to its recently acquired building next to it on Pearl Street. When alterations to the new and old quarters are finished, its salesroom space will be doubled and considerable space will be added to the general offices and shipping room.

## Westinghouse Homewood Plant Was Opened Last Week

With an inspection by executives and managers of the company, the new renewal-parts plant of the Westinghouse Electric & Manufacturing Company, Homewood, Pittsburgh, was formally opened last week.

The plant, which will begin operations immediately, fills a long-felt need for such an activity in this district and it constitutes an addition to the already broad service program of the Westinghouse company. The new works, with other additions to be erected in the future as they are needed, will specialize in the manufacture of renewal parts for motors and other apparatus already in service but which have become non-current and obsolete.

The new building, situated near the Homewood station of the Pennsylvania Railroad and connected to that railroad by a siding running into the building, is of brick, cement and steel, 202 ft. long and 102 ft. in width. It is built on a plot of three acres, providing ample space for future expansion.

The management of the new plant is headed by E. C. Brandt, a Westinghouse employee for eighteen years. Mr. Brandt came to the Homewood plant from Brooklyn, N. Y., where he directed the operation of the Krantz Manufacturing Company, which was combined by the Westinghouse Electric Company under the name of the Electric Products Company of Mansfield, Ohio. W. C. Henderson, formerly general foreman of the railway department at the East Pittsburgh main works of the Westinghouse Company, is superintendent. F. F. Rohrer will direct the sales activity, and A. L. Broomall will be renewal-parts engineer.

## Orders "Simplex" Suit Tried in U. S. District Court

The suit of the American Steel Foundries against Thomas E. Robertson, commissioner of patents, and the Simplex Electric Heating Company, to compel registration of the trademark "Simplex" will be tried by the United States District Court. Suit was filed in the District Court for Northern Illinois. The court dismissed the bill on the ground of lack of jurisdiction. The Supreme Court on May 21 declared that the dismissal was erroneous and that the law regarding trademarks is not the same as that governing patents.

## Wagner Electric Company Loses in Supreme Court

The Wagner Electric Company lost in its efforts to resist payment of a judgment of Lamar Lynden for royalties on a patent when the United States Supreme Court on May 21 affirmed the decision of the lower courts dismissing the company's suit against Lynden and the sheriff of St. Louis. Lynden sued, won a judgment, and an execution was issued for the $12,029 ordered by the jury. The company paid, then sued to prevent the sheriff turning the money over to Lynden and recover it.

## General Electric Receives Large Sawmill Orders

The General Electric Company has received an order for the complete electrical equipment of the power plant of an immense sawmill being built by the Long Bell Lumber Company at Longview, Wash. The mill will have a steam-electric power plant of 20,000 kw. capacity.

The equipment which has been ordered includes three 6,000-kw. generators and turbines, a 200-kw. motor-generator exciter set, a 200-kw. turbine-exciter set, two 300-kw. direct-current motor-generator sets, two 25-kw. battery-charging motor-generator sets, power-house local supply and lighting transformers and complete switchboard.

The Oregon-American Lumber Company at Veronia, Ore., has placed an order for one 2,000-kw., one 1,000-kw. and one 100-kw. turbine and generator, as well as for complete switchboard and all mill motors.

## Duncan Electric Appointments

The Duncan Electric Manufacturing Company, manufacturer of meters and transformers, Lafayette, Ind., announces the appointment of the following district sales agents:

The Power Machinery Company, 601 Dwight Building, Kansas City, L. H. Keller, president, A. G. Miller, secretary, for Missouri, Kansas and Oklahoma. A. F. Krippner, 905 Fourteenth Street, Denver, for Colorado, Wyoming and New Mexico. E. H. Albrecht & Company, 309 Lewis Building, Portland, Ore., for Oregon and Washington. Wallene Engineering Company, 511 Hippodrome Building, Cleveland, for northern Ohio. J. Harry Burroughs, 106 Macamley Street, Buffalo, for the State of New York exclusive of New York City. J. W. Murphy Company, 108 S. LaSalle Street, Chicago, for Chicago and Cook County, Ill.

## Porphyry Copper Earnings Show Improvement

The report of the Utah Copper Company for the first quarter of the current year shows total income of $2,241,111, equivalent to $1.37 a share (par $10) on $16,244,900 capital stock, against $1,740,249, or $1.07 a share in the preceding quarter. Operating profit was $1,797,521, against $1,346,287, and the surplus after dividends, $616,621, against $928,004.

The first quarter output of Utah amounted to 33,103,190 lb. of marketable copper, against 31,495,654 lb. in the last quarter of last year, according to D. C. Jackling, president of the company. The cost of production was 8.825 cents a pound, including all fixed and general charges, except depreciation and federal tax reserves.

The Nevada Consolidated Copper Company reported for the first quarter a total income of $544,222, equivalent to 27 cents a share (par $5) on the $9,097,285 capital stock, as against

$417,082, or 20 cents a share, in the preceding quarter. Operating profit was $446,929, against a loss of $164,764 for the last quarter of last year. In commenting on the result of operation of this company, Mr. Jackling notes that production amounted to 11,780,815 lb. of copper, against 7,448,465 lb. the previous quarter.

The Ray Consolidated Copper Company for the first three months of 1923 showed a total income of $488,425, equivalent to 31 cents a share on the $15,771,790 (par $10) capital stock, against $201,903, or 12 cents a share, for the previous quarter. Operating profit was $458,988, against $165,538, and other income $29,436, against $36,365. In his remarks to stockholders, Sherwood Aldrich, president, points out that production for the first three months of the current year amounted to 14,009,441 lb. of net copper, against 12,249,695 lb. in the preceding three months.

## Guth Lighting Fixture Firm in Million-Dollar Organization

The Edwin F. Guth Company, manufacturer of lighting equipment, is the new name by which the unified interests of the St. Louis Brass Manufacturing Company and the Brascolite Company, St. Louis, will hereafter be known. The two companies amalgamated have always been interrelated. The Brascolite Company was a division of the St. Louis Brass Manufacturing Company. The St. Louis Brass Manufacturing Company, the parent company, was incorporated in 1902 by Edwin F. Guth and associates for the manufacture of lighting fixtures of all types.

## Complaint About Hygrade Lamp from Federal Trade Commission

The Federal Trade Commission has issued a complaint against the Hygrade Lamp Company, Salem, Mass. The respondent is charged with acquiring the capital stock of the Lux Manufacturing Company, a competing concern, and has therefore gained control and management of such competing company. This, the commission alleges, has the effect of substantially lessenging competition heretofore existing between the two companies.

Further allegations are to the effect that the respondent adopted and enforced a policy of requiring each and every jobber purchasing its lamps to enter into an exclusive agreement whereby such jobber agrees to purchase its entire requirements of electric lamps for a period of one year from the respondent and not to offer for sale, quote or sell Hygrade lamps to customers outside of the jobber's exclusive territory, which is clearly defined in the agreement, the respondent agreeing to sell exclusively to the jobber in his exclusive territory.

The respondent's acts, the commission alleges, have a tendency to deprive the general purchasing public of the benefits of free competition in the products which are handled by the respondent. Thirty days will elapse in which the respondent may make answer to the charges before a day is set for further hearing before the Federal Trade Commission.

## Eureka Cleaner Sales Meeting

A. S. McCarthy, vice-president and general sales manager of the Eureka Vacuum Cleaner Company, Detroit, visited Spokane May 11 and was the guest of honor at a banquet held the same evening. Fifty of the Eureka sales staff in Washington, Idaho and Montana were present.

"We will sell 200,000 cleaners in 1923," said Mr. McCarthy. "This may seem like a large statement until you hear that we sold 150,000 in 1922 and that the buying power is greater this year than last. I found prosperity in every city visited on this tour. Two-thirds of the districts have made sales that are ahead of their quota in number."

Mr. McCarthy's address was followed by the display of half a mile of film showing the manufacture of Eureka cleaners. Stress was laid on the point that every part of this machine is made in the company's plant.

The Wireless Resistor Company, Milwaukee, has been organized by Arnold Pfau, 3011 McKinley Boulevard, consulting engineer of the Allis-Chalmers Manufacturing Company, to engage in the manufacture of a new metal alloy under exclusive American rights to Swiss patents. J. Rohn and Arthur Voss are associated with Mr. Pfau. A factory is being equipped in Milwaukee and it is planned to start production of bars by June 1.

The Arnold Electric Drill Company, New Haven, Conn., recently incorporated under the laws of that state, will engage in the manufacture and sale of electric drills, electric tools and appliances, and will have a factory in that city. The capital stock is $50,000 and the incorporators include Frederick E. Levere, 658 Campbell Avenue, West Haven, Conn.; E. O. Levere and H. A. Walzenberger of New Haven.

The National Light & Electric Company, 291 Market Street, Newark, N. J., radio equipment and electrical specialties, has acquired the four-story building at 57-59 Lafayette Street for a new plant and headquarters. The company will occupy the entire building, totaling about 20,000 sq.ft. of space. George Allendorf is president and Harry Hirsch, treasurer.

The Packard Electric Company, Ltd., St. Catharines, Ont., manufacturer of electric apparatus, announces the appointment of Andrew S. Tait as district sales manager with headquarters in Montreal. Mr. Tait was formerly chief electrical engineer of the Canadian Car & Foundry Company and its subsidiaries and prior to that time with the Canadian General Electric Company as district engineer during a period of thirteen years.

The Glow Electric Company, Cincinnati, manufacturer of portable electric tools and motors, will shortly commence the erection of a factory at Second Street. It will be one story, of concrete construction, with provision for additional floors later.

The Edison Storage Battery Company, West Orange, N. J., has preliminary plans under consideration for the construction of a new plant on a site adjoining the factory of the Ford Motor Company, now in course of erection on Green Island, near Troy, N. Y. Power from the hydro-electric generating plant of the Ford company now being built will be used at the proposed works, which will be used for a certain branch of battery production. It is expected to commence work late this year or early in 1924. The plant will give employment to about 300 operatives.

The Luminier Company, 577 Broadway, New York City, has been incorporated with capital stock of $50,000 to manufacture electric fixtures and equipment. The incorporators are J. Schiller, L. A. Schoen and L. L. Lazaroe.

E. T. Cunningham, Inc., San Francisco, recently incorporated with capital stock of $200,000, will manufacture electrical equipment. The company acquires business and assets of a firm which has been engaged in electrical manufacturing for some time. E. T. Cunningham, 248 first Street, San Francisco, is president.

The Conveyors' Corporation of America, 326 West Madison Street, Chicago, has appointed the Pittsburgh Machine Products Company, Oliver Building, Pittsburgh, as district representative. It is also announced that S. L. Wright & Company, district representatives of the Conveyors' Corporation in Butte, Mont., have moved their offices from 109 East Broadway to 812 East Iron Street.

The Overflow Alarm Corporation, Brooklyn, N. Y., recently organized with capital stock of $100,000, will manufacture electric alarm devices. The company is looking for a plant somewhere in the vicinity of New York. Plans for manufacturing are as yet undetermined. The incorporators are J. E. Tobin, H. Gessler and T. Wolkind. The present address is 51 Chambers Street, New York City.

The Connecticut Telephone & Electric Company, Meriden, Conn., has purchased the former plant of the Wilcox & White Company, makers of Angelus player pianos. This new addition will be known as Plant No. 2 and is located but a short distance from the Connecticut company's plant No. 1. The new plant is a four-story modern brick structure built in the form of a hollow square with power house in the center and contains approximately 125,000 sq. ft. of floor space. It will be used for the general expansion of business.

## Foreign Trade Opportunities

ARAPUNI (NEW ZEALAND) ELECTRIC POWER SCHEME.—Tenders will be received by the secretary of the Public Works Tender Board, Wellington, New Zealand, until Feb. 28, 1924, for section 1, headworks, of the Arapuni electric power scheme. Specifications may be seen on application at the New York, Cleveland, Chicago and San Francisco offices of the ELECTRICAL WORLD.

HYDRO-ELECTRIC PROJECT NEAR SAO PAULO, BRAZIL.—Application has been made by the Sociedad Anonyma Brasital, according to *Commerce Reports*, for permission to build a hydro-electric plant on the Tiete River near the falls of Ittu, a short distance from São Paulo. A concession covering this same project was obtained by the company in 1911.

POWER DEVELOPMENT FOR IRISH FREE STATE.—A company has been formed under the name of the Inner Liffey Power Development Company, Ltd., to supply electricity for lamps and motors. It is proposed that the Free State government should guarantee the financing and take over the operation of the system when completed, either for itself or in collaboration with the corporation of the city of Dublin. The promoters, however, are willing to carry out the entire scheme and are endeavoring to secure a license under Article II of the constitution.

PROPOSED ELECTRIC POWER SCHEME FOR IRELAND. — Plans are progressing, *Commerce Reports* states, for utilizing the water power of the Bann River flowing into Lough Neagh, in County Antrim, Ireland, about 30 miles from Belfast, for the purpose of supplying electricity for all industries in that section. Early this year a bill was introduced into the Imperial Parliament for the chartering of a company and conferring upon it the necessary powers to proceed with the project.

PROPOSED HYDRO-ELECTRIC PLANT IN RIO GRANDE DO SUL.—Plans have been approved to utilize the Toca Falls of the Santa Cruz River in the State of Rio Grand do Sul, Brazil, according to *Commerce Reports*, to supply electricity for light and power for a number of municipalities in São Leopoldo and Taquary. A 40,000-volt transmission line, 79 km. long, will be erected. The cost of the project is estimated at 2,000,000 milreis.

## New Apparatus and Publications

ENGINE-DRIVEN ALTERNATORS. — Leaflet No. 2,390-A issued by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., describes and illustrates the construction of its type "E" engine-driven alternating-current generators rated at from 50 kva. to 3,000 kva.

TEMPERATURE INDICATOR. — The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is distributing leaflet No. 3,477-A, which covers its "Hot-Spot" temperature indicator for transformers.

HOT PLATE. — The Rogers Electric Laboratories Company, Cleveland, has placed on the market a new model hot plate, known as the "Rogers-Quality."

SHOW-WINDOW LAMP. — The Pittsburgh Reflector & Illuminating Company, Bowman Building, Pittsburgh, Pa., is distributing a folder describing the "Pittsburgh" show window "Flood-O-Lite" with center spot for spot lighting and for color lighting.

TEST SET.—The Western Electro-Mechanical Company, Inc., Oakland, Cal., has developed an alternating-current test set in conjunction with an alternating-current ammeter.

ELECTRIC VACUUM CLEANER. — A new electric vacuum cleaner, "Bissle Home," has been placed on the market by the Bissell Motor Company, Toledo, Ohio.

COMMERCIAL LIGHTING UNIT. — A line of lighting units known as "Cora-Lites" has been brought out by the Consolidated Lamp & Glass Company, Coraopolis, Pa.

PORTABLE MOTOR UNIT.—The Champion Appliance Manufacturing Company, Inc., 44 Main Street, Yonkers, N. Y., has placed on the market its "Champco Service Unit," a portable ball-bearing motor mounted on a movable pedestal, which can be adjusted so as to operate various household appliances.

PORTABLE TEST METER.—The Sangamo Electric Company, Springfield, Ill., has placed on the market its "HP-6" alternating-current portable test meter.

ELECTRIC FURNACE TENDER.—The Domestic Stoker Company, Paterson, N. J., has developed an electrically driven machine which enables buckwheat coal and anthracite coaldust to be burned in the ordinary household furnace and which automatically feeds the fuel into the furnace and at the same time withdraws the ashes and deposits them in an outside bin.

WASTE-HEAT BOILER PLANT. — The Heine Boiler Company, St. Louis, is distributing a booklet which describes and illustrates the waste-heat boiler plant of the Cape Girardeau Portland Cement Company, in which "Heine" boilers are used.

INDOOR BUS SUPPORTS.—Schweitzer & Conrad, Inc., 4435 Ravenswood Avenue, Chicago, are distributing bulletin No. 223 covering their type C indoor bus supports.

WATT-HOUR METERS.—The Sangamo Electric Company, Springfield, Ill., has issued bulletin No. 61, giving instructions for the "Sangamo" type-H single and polyphase watt-hour meters.

ELECTRICAL SUPPLIES. — The Mid-West Electric Company, Omaha, Neb., has revised its monthly publication, *Cost Finder*, which contains a list of products carried by the company.

STREET-LIGHTING FIXTURES. — The Mid-West Electric Company, Omaha, Neb., is distributing its street-lighting bulletin which describes and illustrates different types of ornamental lighting fixtures.

## New Incorporations

THE PIGEON RIVER POWER COMPANY, Waynesville, N. C., has been incorporated with a capital stock of $50,000 to construct a hydro-electric plant on the Pigeon River. The incorporators are Feliz E. Alley, Jr., D. L. Boyd and Feliz S. Alley.

THE WILLIAMSBURGH POWER PLANT CORPORATION, Brooklyn, N. Y., has been incorporated by S. Clerke, J. V. Cline and O. Everett. F. J. Knorr, Albany, is attorney.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

WORCESTER, MASS.—The New England Power Company has petitioned the Department of Public Utilities for permission to erect a 110,000-volt transmission line from Adams, Mass., to North Albany, N. Y., connnecting with the substation of the Adirondack Power & Light Corporation at that point. The cost in Massachusetts is estimated at $250,000.

MONTVILLE, CONN.—The Eastern Connecticut Power Company has sold $1,500,000 in stock, the proceeds to be used for the construction of an addition to its local steam-driven electric plant and for the acquisition of other electrical properties.

NEW BRITAIN, CONN.—The P. & F. Corbin Company, a division of the American Hardware Corporation, will build an addition to its power plant, to cost about $30,000.

WINSTED, CONN.—The Riverton Paper Company will install electric power equipment and other machinery at its mill.

## Middle Atlantic States

MEDINA, N. Y.—The Western New York Utilities, Inc., has issued $560,000 in capital stock, part of the proceeds to be used for extensions and improvements.

NEW YORK, N. Y.—Bids will be received by the superintendent of lighthouses, Staten Island, until June 18, for 375 dry cells, 2½ in.x6 in. (Circular 14,866.)

NEW YORK, N. Y.—The New York Edison Company has completed plans for a substation at 49-51 Park Place, to cost $140,000.

NEW YORK, N. Y.—Electric power equipment will be installed in the proposed ice and refrigerating plant to be erected on Washington Street by the Fox-Goldberg Holding Corporation, 350 Broadway, to cost about $150,000. Robert S. Kaplan, 56 West 115th Street, is architect.

POTSDAM, N. Y. — Electric pumping equipment will be installed in connection with the proposed new municipal water system.

WATERTOWN, N. Y.—The Power Corporation of New York, Northern New York Trust Building, has issued $1,000,000 in bonds, the proceeds to be used for the construction of a 6,500-hp. hydro-electric station at Herrings, and to complete the generating plant now in course of erection at Norwood.

NEWARK, N. J.—The Public Service Electric Company plans to build a substation on West Street, Bloomfield. Extensions and improvements will also be made in the mechanical shop and pumping plant, foot of Duffield Street, Jersey City.

BIRDSBORO, PA.—The Birdsboro Stone Company, plans to rebuild its power house and crushing plant recently destroyed by fire, causing a loss of about $250,000.

CHAMBERSBURG, PA.—The Weitzel Lumber Company, Germantown Avenue, Philadelphia, plans to install elecrtic power equipment at its local mill, recently acquired from the Hollinger Planing Mill Company.

ERIE, PA.—The Mutual Telephone Company contemplates the construction of a new exchange building, to cost about $400,000.

MARCUS HOOK, PA.—The Philadelphia Electric Company is reported to have acquired a local site, on which it will erect a large power plant.

NEW OXFORD, PA.—The New Oxford Shoe Company contemplates the construction of a power house in connection with its proposed local plant to cost about $200,000.

PITTSBURGH, PA.—The Bertha-Consumers' Coal Company plans to install electric power equipment at its properties in Pennsylvania and West Virginia.

SOMERSET, MD.—Electric power and mechanical equipment will be installed in the coal-mining properties to be operated by a new company now being organized by D. B. Zimmerman, Somerset, and F. E. Rowe, Jr., Meyersdale, Pa. The new plant will cost about $150,000.

BLUEFIELD, W. VA.—The Morrow Coal Company, recently formed, contemplates the installation of electric power equipment at its local properties.

CABINCREEK, W. VA.—The Virginian Power Company plans to build an addition to its local power plant.

CHARLESTON, W. VA.—The American Gas & Electric Company, 30 Church St., New York, N. Y., has acquired the West Virginia Water & Electric Company and its subsidiaries, the Dunbar (W. Va.) Light & Power Company and the St. Albans (Va.) Power & Light Company. Plans are being considered for extensions in power plants and systems.

GILMER, W. VA.—The Quaker Coal Company contemplates the installation of electric power equipment at its properties, to develop a daily output of 500 tons.

RICHWOOD, W. VA.—Electric power equipment will be installed in the local tanning plant of the Armour Leather Company, in connection with extensions and improvements to cost about $90,000.

SHINNSTON, W. VA.—The Fairmont-West Virginia Coal Company plans to instal electric power equipment at its local properties.

CLARION, VA.—The Altavista (Va.) Light & Power Company has been granted permission to extend its line to Clarion to furnish electricity for lighting purposes.

WASHINGTON, D. C.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, until June 12, for one motor-generator set, one switchboard panel, 880 ft. of cable and three potheads (Schedule 863); also, until June 19, for miscellaneous quantity of flashlights and batteries (Schedule 892.)

WASHINGTON, D. C.—Bids will be received by the Chief of Air Service, United States Army, until June 5 for a quantity of single-pole, double-throw toggle switches. (Circular 23-212.)

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until June 9, for 60 radio control boxes (Proposal 14,738-2CP); also, until June 11, for 110 radio receivers and 110 radio transmitters (Circular PR 14,600-10CP).

## North Central States

DETROIT, MICH.—Plans are being prepared by the Department of Street Railways for the construction of 4 miles of double-track railway line on Warren Road, East Warren and Linwood Avenues, to cost about $500,000. W. C. Markham is chief engineer.

CLEVELAND, OHIO—The Cleveland Railway Company is planning to build six automatic substations, to cost about $1,500,000. Contract has been awarded for equipment for two of the stations that are to be erected at once.

COLUMBUS, OHIO.—Bids will be received by the superintendent of purchases and printing room, room 76, State House, Columbus, Ohio, until June 5 for furnishing materials for rewiring State institutions in or near Cincinnati, Sandusky, Gallipolis, Toledo, Cleveland, Dayton, Columbus and Athens, Ohio.

ELIZABETHTOWN, KY.—The Kentucky Utilities Company, Louisville, contemplates erecting a 33,000-volt transmission line from Elizabethtown to Hardinsville, via Sonora.

LANCASTER, KY.—The Kentucky Utilities Company, Louisville, contemplates doubling the capacity of the local electric plant and to construct an ice plant, to cost about $50,000. G. T. Bogard is chief engineer.

LOUISVILLE, KY.—The Louisville Gas & Electric Company is preparing plans to construct a new power plant, to cost about $2,000,000.

INDIANAPOLIS, IND.—The Indianapolis & Cincinnati Traction Company contemplates extending its electric railway from Connersville to Cincinnati. The cost is estimated at about $1,000,000.

CHICAGO, ILL.—The Commonwealth Edison Company will build a substation on Seminary Avenue, to cost about $50,000.

GRANITE CITY, ILL.—Plans have been prepared by the Commonwealth Steel Company for extensions to its plant, including addition to power plant, pattern shop, new coke-oven building, extension to foundry, new furnace, etc. The cost is estimated at $1,000,000.

BARABOO, WIS.—The Wisconsin Power, Light & Heat Company contemplates extensions and improvements in the local plant of the McFetridge Lighting Company, recently acquired, including extensions to transmission line.

LITCHFIELD, MINN.—The City Council is considering an issue of bonds for remodeling the municipal electric light and waterworks plant.

ST. PAUL, MINN.—Contract will soon be awarded by the State Board of Control for an addition to the power plant at the Crippled Children's Home.

DUNBAR, IOWA.—The Dunbar Light & Power Company, recently organized, is planning to supply electricity in the village of Dunbar and vicinity. John Ingebritson is president.

MAQUOKETA, IOWA.—Contract has been awarded by the Hydro-Electric Company of Maquoketa for the construction of a large power dam on the Maquoketa River in connection with a large hydro-electric project. No machinery or equipment is included in the contract.

OSKALOOSA, IOWA.—The Oskaloosa Ice & Cold Storage Company plans to build a power house.

KANSAS CITY, MO.—The Ralston Purina Company, Eighth Street, plans to build a power house in connection with its plant at Scott and Rochester Streets, to cost about $1,000,000.

STOCKTON, MO.—The installation of a municipal electric light plant, to cost $20,000, is under consideration.

CROSBY, N. D.—The erection of an 13,200-volt transmission line from Crosby to Noonan is under consideration by the United Power Company.

CHANCELLOR, S. D.—Bonds to the amount of $10,000 have been issued for the installation of a municipal electric distributing system.

ARKANSAS CITY, KAN.—The Roxana Petroleum Corporation, St. Louis, plans to build a substation in connection with its proposed local refinery, to cost about $4,000,000.

BETHEL, KAN.—The Commissioners of Wyandotte County have instructed O. K. Williamson, county engineer, to prepare plans and estimates of the erection of a transmission line from Bethel to the county poor farm, a distance of about 2½ miles, to connect the poor farm with the lines of the Standard Light & Power Company. It is proposed to abandon the power plant at the institution.

EMPORIA, KAN.—The City Commission has authorized the Kansas Electric Power Company to rebuild the transmission line to the pumping station on the Neosho River. The cost is estimated at about $3,000.

OXFORD, KAN.—Plans are being prepared for the erection of a transmission line from Winfield to the Arkansas River station for local service, to cost $18,000. W. B. Rollins & Company, Railway Exchange Building, Kansas City, Mo., are engineers.

WICHITA, KAN.—The Kansas Gas & Electric Company has disposed of a bond issue of $3,500,000, part of the proceeds to be used for extensions to its system.

## Southern States

HIGH POINT, N. C.—The Giant Furniture Company contemplates rebuilding its power house and plant, recently destroyed by fire, with loss of about $150,000.

LEXINGTON, N. C.—The Poneemah Mills Company plans to install a substation in connection with its proposed local cotton mill, to cost about $100,000.

SANFORD, N. C.—The Virginia & Carolina Mining Company, Winston-Salem, plans to construct a power house at its new local smelting plant.

WAYNESVILLE, N. C.—Surveys are being made by the Pigeon River Power Company, recently organized, for a large hydro-electric development on the Pigeon River, between Waynesville and the Tennessee line.

GREENVILLE, S. C.—The Southern Worsted Corporation contemplates the construction of a substation in connection with a new local mill. Lockwood, Green & Company, Charlotte, N. C., are engineers.

HEATH SPRING, S. C.—Bonds to the amount of $35,000 have been voted for extensions and improvements to the electric plant and waterworks.

DAWSON, GA.—Plans are under consideration for the construction of a hydro-electric plant to supply electricity in Dawson, Shellman and Cuthbert. W. H. Locke is member of a committee appointed to look into the matter.

ROME, GA.—Plans are under consideration for the construction of a hydro-electric plant on Two Run Creek to supply electricity for the Eureka Mill, operated by Roy Wright and George Flemister.

BLOUNTSTOWN, FLA.—The Florida Orchard & Packing Company contemplates the construction of a power house at its proposed local fertilizer plant.

CANAL POINT, FLA.—The Florida Sugar & Food Products Company, Lake Worth, contemplates the installation of electric power equipment at its local mill in connection with proposed extensions and improvements to cost about $300,000.

HALE'S BAR, TENN.—Plans are being prepared by the Alabama Power Company and the Tennessee Electric Power Company for the construction of a steel-tower transmission line from Huntsville, Ala., to Hale's Bar, for interchange of service. The cost is estimated at $600,000.

BIRMINGHAM, ALA.—The Alabama Power Company has been granted permission to extend its transmission line to Childersburg, Waverly, Wetumpka, Centerville and Brent.

BIRMINGHAM, ALA.—The Alabama Power Company is preparing plans for the construction of an addition to its hydro-electric power plant, near Lock 17, on the Warrior River, to cost about $500,000.

UNION SPRINGS, ALA.—Permission has been granted the Alabama Power Company, Birmingham, to extend its transmission lines from a point near Tuskegee to Union Springs.

GREENWOOD, MISS.—The City Council has awarded a contract for the construction of a new power station for the municipal light and water plant.

LOUISVILLE, MISS.—The Council is considering calling an election to vote on the proposal to issue $30,000 in electric light bonds.

CAMDEN, ARK.—The Morris Oil Company plans to construct a substation in connection with its proposed local oil refinery, to cost about $300,000.

PINE BLUFF, ARK.—The Arkansas Light & Power Company has awarded contract to Ford, Bacon & Davis, 115 Broadway, New York City, for construction of dam and power station on the Ouachita River, near Malvern, to develop 10,000 hp. The cost is estimated at $1,250,000.

CROWLEY, LA.—Plans are under consideration for the installation of an improved fire-alarm system.

STILLWATER, OKLA.—The Council is considering the installation of electrically operated pumps in connection with a municipal waterworks system to cost about $150,000. V. V. Long & Company, Colcord Building, Oklahoma City, are engineers.

ORANGE, TEX.—The Houston, Beaumont & Orange Interurban Railway Company, organized to construct a traction line from Houston to Orange, 100 miles, plans to build a power plant and install a series of substations. S. M. White, Orange, is interested in the company.

TULSA, OKLA.—The installation of a series of electrically operated pumping plants in connection with a new pipe line from Owens Junction to Midway, a distance of 28 miles, and from Midway to Burbank Junction, 18 miles, to cost about $300,000, is under consideration by the Prairie Pipe Line Company.

FORT WORTH, TEX.—The Fort Worth Elevator Company contemplates the construction of a substation in connection with its proposed local grain elevator, to cost about $500,000.

SAN ANTONIO, TEX.—W. H. Williams and associates have acquired lignite lands in McCullen County, where they will build an electric power plant, using lignite for fuel.

YORKTOWN, TEX.—The Texas Central Power Company, San Antonio, will extend its transmission line to this place for service at Victoria, Nordheim, Nursery and Craig.

## Pacific and Mountain States

SEATTLE, WASH.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until June 12, for electric equipment for the Puget Sound Navy Yard, including one switchboard (Schedule 881); miscellaneous quantity of electric cable (Schedule 882), and two transformers (Schedule 880).

PORTLAND, ORE.—The Grand Rapids (Mich.) Showcase Company contemplates the construction of a power house in connection with its proposed local branch plant, to cost about $500,000.

VERNONIA, ORE.—The Oregon-American Lumber Company will build an electric plant in connection with its proposed local mill, to cost about $175,000.

ALHAMBRA, CAL.—An election will be held June 5 to vote on a proposal to issue $250,000 in bonds, of which $75,000 is to be used for the installation of a new fire-alarm system and the purchase of fire apparatus.

COMPTON, CAL.—The City Council is planning to install street lamps from the northern limits of the city south to Olive Street.

EUREKA, CAL.—Electric power equipment will be installed in the proposed ice-manufacturing and cold-storage plant to be built by the Eureka Ice & Cold Storage Company, recently organized, to cost about $100,000.

FULLERTON, CAL.—Electric power equipment will be installed in the two cold-storage and precooling plants to be erected by the Placentia Orange Growers' Association at Fullerton and Placentia, to cost about $75,000 and $85,000 respectively.

LOS ANGELES, CAL.—An ordinance has been approved for the installation of an ornamental lighting system on Hollywood Boulevard from Verona Avenue to Vine Street.

LOS ANGELES, CAL.—Bonds to the amount of $808,000 have been issued for the installation of an ornamental lighting system on Belle Porte Avenue between Weston and 255th Streets.

LOS ANGELES, CAL.—The City Council has passed an ordinance authorizing the submission of a power bond issue of $35,000,000 to the voters at the general election to be held June 5. Of this amount $25,000,000 will be used for the proposed hydro-electric development at Boulder Canyon and the erection of a transmission line, and $10,000,000 for additional distribution facilities.

OAKLAND, CAL.—The Pacific Gas & Electric Company has acquired a site in the East Bay district on which it will erect a large substation.

OAKLAND, CAL.—The Victor Talking Machine Company, Camden, N. J., contemplates the construction of a power plant

at its proposed new branch factory, to cost about $250,000. J. C. Wicks is general production manager.

PASADENA, CAL.—The City Directors have approved an ordinance calling for an issue of $730,000 in bonds, recently voted, of which $300,000 will be used for improvements to the Light and Power Department.

BOISE, IDAHO.—The Idaho Power Company has applied for permission to erect twenty-nine transmission lines, totaling 438 miles, in Idaho and Oregon, to serve sixty-seven communities along the Snake River.

CEDAR CITY, UTAH.—Tentative plans are under consideration by the Dixie Power Company for the construction of additional plants in the Pine Valley Mountains and a steam-driven plant in the coal district east of Cedar City.

RICHFIELD, UTAH.—The Royal Purple Mines Company has filed application with the state engineer for water rights to be used for the development of power.

CORTEZ, COL.—The Cortez Light & Power Company has been granted a franchise to construct and operate an electric light plant in Cortez.

WESTCLIFFE, COL.—The Custer County Electric Company, recently incorporated, is planning to construct an electric plant at Westcliffe. C. B. Beardsley is interested in the company.

## Canada

FREDERICTON, N. B.—The construction of a transmission line from the Maine & New Brunswick Electric Power Company's lines near the Brunswick border to the St. John River valley as far as Woodstock is under consideration by the New Brunswick Electric Power Commission.

PORT DALHOUSIE, ONT.—The Public Utilities Commission is considering the reconstruction of the distribution system on the south side of the proposed canal.

SMITH FALLS, ONT.—The ratepayers have approved a bylaw authorizing the purchase of a power plant for use in connection with the waterworks system.

MONTREAL, QUE.—The Montreal Island Power Company, recently organized, with a capital stock of $1,375,000, proposes to build a hydro-electric plant on the Back River on the Island of Montreal to develop about 45,000 hp.

## Electrical Patents

**Announced by U. S. Patent Office**

(Issued May 8, 1923)

1,454,474. POTENTIAL INDICATOR; O. E. Huebner, Richmond Hill, N. Y. App. filed July 5, 1921. Device to show if underground cable is alive.

1,454,493. MILL; A. Sundh, Hastings-Upon-Hudson, N. Y. App. filed Oct. 8, 1920. Instrument for indicating travel of moving part of mill.

1,454,495. SYSTEM OF CURRENT-WAVE TRANSMISSION; H. J. Vennes, New York, N. Y. App. filed May 26, 1919. Two-way transmission of modulated currents applied to telephony.

1,454,496. CALLING DEVICE; A. Vischer, Jr., Floral Park, N. Y. App. filed Dec. 21, 1920. Dial for automatic telephone system.

1,454,526. ELECTRIC BATTERY CONTROL DEVICE; W. V. Turner, Wilkinsburg, Pa. App. filed Oct. 29, 1917. Automatic device for operating storage batteries in parallel, preventing unequal discharge.

1,454,530. HANDLAMP; A. A. Arnold, Hartford, Conn. App. filed April 2, 1921. Electric flashlight.

1,454,532. METHOD OF AND MEANS FOR SECRET SIGNALING; W. E. Beatty, Bayside, N. Y. App. filed Aug. 1, 1917. Carrier wave unintelligible unless received by specially designed apparatus.

1,454,533. SUPPORT FOR TELEPHONE RECEIVERS; M. A. Bowen, Fresno, Cal. App. filed July 13, 1921. Holds receiver to ear of speaker.

1,454,566. ELECTRICAL DISPLAY DEVICE; C. E. Smith, Johnstown, Pa. App. filed Sept. 8, 1921. Successively lighting series of lamps.

1,454,567. METHOD AND APPARATUS FOR PRODUCING A CHEMICAL UNION BETWEEN HYDROCARBON GASES AND HYDROCARBON OILS; H. B. Snyder, Fullerton, Cal. App. filed Dec. 27, 1921. By electric arc.

1,454,571. STORAGE BATTERY; W. H. Thorpe, Mount Vernon, N. Y. App. filed Aug. 22, 1921. Small current output with large ampere-hour capacity.

1,454,592. WIRELESS DIRECTION-FINDING MEANS FOR AND METHOD OF PILOTING AIRCRAFT; H. R. C. Van de Velde and J. M. Furnival, Bromley, England. App. filed Jan. 7, 1921.

1,454,598. WIRELESS TRANSMITTER; W. T. Ditcham, Twickenham, England. App. filed Dec. 18, 1920. Valve transmitter for wireless telegraphy.

1,454,622. CHANGEABLE SIGN DEVICE; H. W. Cairns, Detroit, Mich. App. filed June 15, 1920. Automatic mechanism driven by motor.

1,454,623. ELECTRIC TESTING DEVICE; R. H. Carter, Cleveland, Ohio. App. filed Feb. 2, 1920. Mechanically protected test lamp in series with sharpened contact points.

1,454,624. RADIO-TELEGRAPHY SIGNALING SYSTEM; C. C. Chapman, Palo Alto, Cal. App. filed April 27, 1920. Single-wave radio signaling.

1,454,629. RADIO-TELEGRAPHY SIGNALING SYSTEM; H. F. Elliott, Palo Alto, Cal. App. filed June 6, 1921. Uniwave continuous oscillation transmission system.

1,454,630. RADIO-TELEGRAPHY; H. F. Elliott, Palo Alto, Cal. App. filed June 6, 1921. Single-wave signaling system.

1,454,634. INSULATOR; W. T. Goddard, Hamilton, Ontario, Can. App. filed Jan. 25, 1919. Construction of insulators subjected to large tensile strains.

1,454,644. ELECTRIC SPEEDOMETER; C. F. Kettering, Dayton, Ohio. App. filed Aug. 28, 1918. Magnetic type.

1,454,652. RADIO-FREQUENCY TRANSMISSION SYSTEM; H. Pratt, San Francisco, Cal. App. filed Nov. 22, 1921. Embodies Poulsen arc.

1,454,673. TROLLEY GUARD; M. Firl, Meyersdale, Pa. App. filed July 15, 1922. Prevents wheel from disengaging from wire.

1,454,706. TROLLEY-POLE SAFETY DEVICE; G. W. Dague, Oklahoma, Okla. App. filed May 12, 1922. Prevents pole from disengaging from wire.

1,454,719. FAC-SIMILE TRANSMISSION SYSTEM; H. G. Bartholomew, London, England. App. filed May 18, 1922. Photographic transmission on wires.

1,454,722. SWITCH BOX; L. Boutin, New York, N. Y. App. filed May 29, 1922. For house wiring.

1,454,736. ELECTRIC WATER STERILIZER AND PURIFIER; W. T. Harrell, Wichita, Kan. App. filed Aug. 8, 1922.

1,454,744. ELECTRIC SWITCH-HOUSE CONSTRUCTION; B. G. Jamieson, Brookfield, Ill. App. filed April 8, 1922. Complete switch-house and bus structure outlined.

1,454,768. LOCK; R. R. Raymond, New York, N. Y. App. filed May 8, 1922. For telephones to prevent unauthorized use.

1,454,773. TELEPHONE ATTACHMENT; G. W. Sumner, Dorchester, Neb. App. filed Oct. 11, 1921. For selective ringing or party line systems.

1,454,833. ELECTRICAL MACHINE; L. A. Darling, Philadelphia, Pa. App. filed April 30, 1919. Effective ventilation of armature.

(Issued May 15, 1923)

15,597 (reissue). MEASURING AND INDICATING APPARATUS; H. Brewer, Wilmette, Ill. App. filed Feb. 21, 1919. Temperature indicator.

1,454,840. MEANS FOR RINGING OVER MULTIPLEX TRANSMISSION CHANNELS; H. A. Affel, Brooklyn, N. Y. App. filed July 29, 1919.

1,454,847. SALT-BATH FURNACE; O. A. Colby, Irwin, Pa. App. filed Jan. 16, 1920. For heat-treating and tempering steel tools.

1,454,853. MOTOR-CONTROL SYSTEM; R. T. Kintzing, Wilkinsburg, Pa. App. filed July 30, 1920. For motors applied to cloth-printing apparatus.

1,454,858. CONNECTION PLUG; W. E. Price, New York, N. Y. App. filed May 12, 1920. Heavy-current stage plug.

1,454,867. MOTOR-CONTROL SYSTEM; W. R. Taliaferro, Pittsburgh, Pa. App. filed Aug. 18, 1921. For railway motors.

1,454,872. COMMUTATOR REPULSION-INDUCTION MOTOR; C. A. M. Weber, Edgewood Park, Pa. App. filed Oct. 16, 1918. Has characteristics of both repulsion and induction motor.

1,454,875. ELECTRIC HEATER FOR SHOE MACHINERY; C. L. White, Medina, N. Y. App. filed Jan. 24, 1921. For edge-setting soles.

1,454,878. MAGNETIZABLE METER VANE; T. D. Yensen, Swissvale, Pa. App. filed June 9, 1919. Alloy of nickel and iron.

1,454,879. CONNECTION OR BINDING TERMINAL; R. Zollner, Dresden, Germany. App. filed April 6, 1921. Distribution block.

1,454,895. ELECTROLYSIS MITIGATION; G. G. Jones, New York, N. Y. App. filed Sept. 24, 1920. By raising earth potential in vicinity of trolley tracks.

1,454,925. DYNAMO-ELECTRIC MACHINE; R. E. Hellmund, Swissvale, Pa. App. filed Nov. 19, 1917. Single-phase commutator-type motor.

1,454,928. CONTROL SYSTEM; G. W. Hurtt, Wilkinsburg, Pa. App. filed Aug. 17, 1920. Automatically shunting starting resistance in series with motor armature.

1,454,943. ELECTRIC BATTERY; D. Pepper, Philadelphia, Pa. App. filed Aug. 9, 1921. Primary battery.

1,454,954 and 1,454,955. CLOCK; T. S. Casner, Plainfield, N. J. App. filed Sept. 18, 1920. Secondary clock with electromagnetic drive.

1,454,969. MOTOR; F. Hornby, Liverpool, England. App. filed April 28, 1920. Toy motor.

1,454,997. CRYSTAL DETECTOR; G. Greco and K. G. Wolff, Newark, N. J. App. filed April 18, 1922. Dust-proof holder.

1,455,001. STOP AND TURN SIGNAL; Y. Honda, Fowler, Cal. App. filed July 26, 1922. For automobiles.

1,455,054. AUTOMOBILE SIGNAL; M. G. Ivandick, North Chicago, Ill. App. filed April 18, 1922. Rear direction signal.

1,455,074. APPARATUS FOR RECORDING LIGHT; T. W. Case, Scipio, N. Y. App. filed Dec. 11, 1920. Apparatus reading in footcandles utilizes photo-electric cell.

1,455,081. INDUCTANCE COIL; E. G. Danielson, San Francisco, Cal. App. filed May 25, 1921. For radio apparatus.

1,455,099. HIGH-FREQUENCY SIGNALING SYSTEM; W. R. G. Baker, Schenectady, N. Y. App. filed Jan. 5, 1922. Radio transmitting system.

1,455,122. ELECTRIC LAMP SOCKET; C. E. Stahl, Meriden, Conn. App. filed Jan. 22, 1920. Miniature bulb socket.

1,455,139. ELECTRIC DEHYDRATOR; F. W. Harris, Los Angeles, Cal. App. filed Oct. 19, 1920. For removing water from petroleum.

1,455,141. RADIO RECEIVING APPARATUS; P. D. Lowell and F. W. Dunmore, Washington, D. C. App. filed March 27, 1922. Radio and audio frequency amplifier using alternating current on tubes.

1,455,188. METHOD OF FORMING FLAT COILS; H. G. Cox, Chicago, Ill. App. filed June 23, 1919. Making oval coils at high speed.

1,455,194. MOTOR CONTROL; J. Eaton, Schenectady, N. Y. App. filed March 15, 1921. For motors operating feed of planer or the like.

1,455,205. ELECTRIC SADIRON; R. J. Hovey, Chicago, Ill. App. filed Jan. 19, 1921.

1,455,231. MANUAL SIGNAL FOR VEHICLES; J. Spaventoy, Brooklyn, N. Y. App. filed Sept. 10, 1921.

1,455,246. ELECTRIC IMMERSION HEATER; M. C. Furstenau, Philadelphia, Pa. App. filed Dec. 10, 1921.

1,455,285. TELEPHONE INDICATOR; W. H. Eastman, Concord, N. H. App. filed June 1, 1922. Indicates whether some other party on line is using it.

1,455,287. ELECTRIC HEATER; I. L. Hadley, Hartford, Conn. App. filed Aug. 23, 1922. Bottle to be heated placed in bag lined with heating element.

1,455,344. VENT PLUG FOR STORAGE BATTERIES; L. Lyndon, New York, N. Y. App. filed Sept. 7, 1921.

1,455,375. LIGHTING FIXTURE; H. C. Adam, St. Louis, Mo. App. filed Aug. 30, 1920. Inclosed globe designed to reflect most of light downward.

1,455,399. FLUSH WALL-RECEPTACLE PLATE; W. R. Keavaney, Waterbury, Conn. App. filed March 13, 1920.

1,455,415. CONDUCTOR CONNECTION; J. T. Tighe, Scranton, Pa. App. filed Jan. 14, 1921. For trolley cross-over wires.

1,455,422. DIRECTION INDICATOR FOR MOTOR VEHICLES; S. H. Boitnott, Roanoke, Va. App. filed April 18, 1921.

1,455,458. MEANS FOR DETECTING SMALL ELECTRIC CURRENTS; J. S. E. Townsend, Oxford, England. App. filed Oct. 15, 1918.

# A Challenge to Initiative

TO GATHER at conventions, to learn by direct contact of one another's accomplishments, to realize the progress going on about one, is always an inspiration. Each convention leaves some evidence of its being. But the N. E. L. A. convention just closed proved more than an inspiration—the records of progress, the opportunities for the future, the very insistency of the demand for action to meet various needs, provide a challenge to the initiative of every man in the electrical industry.

Who can sit idly by when nation-wide superpower networks are discussed on such a sound basis of knowledge, with such background of experience, such assurance of ultimate accomplishment, as was voiced this week? The opportunities thus unfolded appeal alike to executive, to engineer, to commercial man, each in his own sphere, to help make possible the development which will mean so much.

Who can listen to John A. Britton and others who talk his language without becoming imbued with a desire to make immediately effective the ownership of all utilities by the public through stock ownership—according to the basic ideals on which this nation has developed?

Can there be any one who would listen to a symposium on public relations such as was held on Thursday without being ashamed of any and every act of his own which contained the possibility of needlessly offending a customer, who would not feel bound to reform for the benefit of himself, his industry and his customers?

The demands made on accountants for more efficient methods and personnel—the direct appeal made by R. F. Schuchardt that engineers rise to their opportunities, while he pictured to the executives the extent to which they depend on the engineer and could depend on him still more in the future—the vision of opportunities opened up to the commercial men, with the accompanying analysis of markets hungry for energy and equipment, the demand for electric service from every quarter, as discussed by these men—all this is an exhortation to the industry and to the men who make it up that must and will be met.

The electrical industry is not one to slacken its pace for any reason. Rather at every opportunity it leaps forward with increased momentum. The convention just past has not only offered opportunity—it has issued a challenge to perform tasks, to conquer obstacles, and yet to render an unequaled service, which may well tax the initiative of every one who fills a place, however small, in the industry's ranks.

# Walter Howard Johnson

*A Philadelphian who has had a large part in building up the electrical industry in his native city and has made his influence felt beyond its boundaries.*

THE new president of the National Electric Light Association, Walter H. Johnson, has for more than thirty-five years been identified with the corporations engaged in developing the electric public utilities of Philadelphia. For the greater part of that time he has occupied an official position, and he is now the senior vice-president of the Philadelphia Electric Company, which furnishes light and power service in Philadelphia and its widely extended suburban communities.

Mr. Johnson was born on Aug. 27, 1863, at Philadelphia. After a public school education and a varied early experience he entered the employ of the Edison Electric Light Company of Philadelphia on its formation in 1887 and soon afterward was elected secretary. During this formative period of the central-station industry, in the capacity of general manager and secretary of the Philadelphia Edison company, he was associated with the pioneers of electric light and power who in every city were laying the foundations of the great industry that has so quickly grown to the mammoth proportions of today.

After several changes in company control the Philadelphia Electric Company was incorporated on Oct. 6, 1899. Of this organization Mr. Johnson has been assistant to the president, a director and vice-president for many years, and a little more than a year ago he was elected senior vice-president. His connection with the industry has not, however, been confined to the Philadelphia companies. He has been for ten years on the executive committee of the National Electric Light Association and for the last year has been the ranking vice-president of that body. He was president of the Electric Vehicle Association and closely associated with the founders of the Society for Electrical Development, of which he was chairman of the executive committee for some years. He was also president for two terms of the Association of Edison Illuminating Companies and has served for many years on numerous important committees of both the Edison association and the N. E. L. A.

He is a member of the Franklin Institute of Pennsylvania, a life member of the Navy League of the United States and a member of the Pennsylvania Society of the Sons of the Revolution, as well as being prominent in Masonic circles in Philadelphia. His Philadelphia clubs include the Union League, Racquet, Philadelphia Country and the Merion Cricket, and he is also a member of the Engineers' Club of New York.

# Editorial Comment

Electrical World, June 9, 1923

Volume 81 Number 23

## Convention of National Electric Light Association

IN POINT of attendance the forty-sixth convention of the National Electric Light Association, which closed its sessions yesterday in New York City, was by far the largest ever held by the association; in interest displayed, in scope of program and in its general features it was also signally impressive. Bigness was its essential characteristic. There was no escape from a consciousness that the electric public utilities of the country were doing great things and had even greater things in contemplation. Seldom has so vivid an impression of their opportunities and their obligations to serve the nation been given to the executive heads of the industry, and seldom has the question of public relations been so completely and so thoroughly discussed. Banker, farmer, educator, manufacturer, publicist, regulator and government official vied with men of the industry in their appreciation of the importance of this question, and evidence was not lacking that customer ownership of securities offers a partial solution. If there ever was a convention which served to impress executives, engineers, commercial men and accountants alike with the outstanding problems of the industry and which was effective in ridding them of provincialism, it was the one just closed. For this President Frank W. Smith, the staff at headquarters and the numerous committees deserve credit. The operating companies in the metropolitan district of New York are also to be commended for the excellence of the arrangements and the hospitality showered on the delegates and guests. In every way the convention was an accomplishment of which the industry may well be proud.

## Public Relations Work Assuming More Definiteness of Character

THE phrase "public relations" is an old one in public utility circles, and its indefiniteness has been one of the difficulties in reaching agreements on what to do and how to do it. As Chairman Sands aptly put it this week, when the Public Relations Section was started it sailed out on uncharted seas for a destination unknown, with but a vague notion of the haven to be sought. But any one who attended the three sessions at the convention, or who takes the trouble to study the record of these sessions, must certainly agree that the very accomplishment of such a series of meetings proves that bearings have been taken and a more definite course is being steered. Not that good public relations has any easy or specific definition—although "public sympathy and active appreciation in the degree to which it is merited" carries a good deal of significance. But the fact that discussions tend to leave generalities and get down to cases, the fact that more and more is the individual contact with and education of the consumer recognized as essential, and the fact that executives are taking active and not passive interest, all show that substantial and definite progress is being made.

This subject is admittedly—even emphatically—one of the most important for the future as well as the present of the industry. The reports of the meetings, the symposium of commissioners and executives, given in this issue are well worth study and should serve as inspiration to every utility man—and every other electrical man—in his daily life.

## Customer Ownership a Vital Necessity

ELECTRICAL men and women have been told the benefits of customer ownership of utility securities many times in the past half dozen years, but in the lens of the N. E. L. A. convention this week the growth and achievements of this wonderful movement for better public relations and more convenient financing were focused with new power by leaders of thought and action for the clearer visualization of the industry. At a notable gathering Messrs. Britton, Hall, Egan and Forbes held their audience almost spellbound as, with clarity of vision, they told what the achievements and opportunities of this great development mean to utilities. Barely nine years ago the first offering of securities to employees and then to the customer public was made by Mr. Britton's own company, and like a rolling snowball the development has spread from coast to coast and is now in amazing popularity. To its celebrated victory over state ownership last fall in California could be added numerous other triumphs if space permitted, but enough has been learned about this policy to establish it as absolutely essential to the permanent success of private management under public regulation.

No apologies are offered the readers of the ELECTRICAL WORLD for the pages devoted in this issue to the message of these able leaders as presented at the New York convention. In their addresses a new observation of latitude and longitude was taken for the industry's course toward the goal of full customer and employee participation in utility financing. These men made it plain that full speed ahead must be the order, coupled with a keen look-out for the rocks of indifference to human relations and the shoals of ill-advised security issues. The crew must be made partners in privilege and responsibility to insure a steady voyage, and the warm sun of friendly intercourse between navigating officers, personnel and passengers must be welcomed to drive away the fogs of misunderstanding and false propaganda. There must be no mistakes as to soundings of financial depths. Given these things, the good ship will speed over quiet seas, leaving old misunderstandings and errors to churn and die in the waters of the past, while, obeying the chart of the new policy, a straight course is steered to the port of entirely success-

ful public relations. Without this movement, private management might easily be swamped in the stormy seas of political control, leaving the industry to drift on the waters of lost initiative to an uncertain and perhaps fatal end.

### Company Budget for Control Needs Intelligent Use

THE annual budget has been a bugbear in many organizations because it has been made a method for beating down expenditures by tying department heads to estimates made months in advance on meager data and then treating failure to live up to the estimates as reprehensible. It is unfortunate if, as some accountants claim, so useful a method has become a stumbling block to its own greatest effectiveness. The whole—and wholesome—purpose of budget formation is to build up an intelligent control of business expenditures by placing before responsible officials the best guess that can be made of the things to be provided for over the budget period. At no time is it possible to estimate months in advance the actual expenditures that must be made. But the best estimate based on available data does show department heads the direction in which they are traveling, and as new conditions arise the budget should be unhesitatingly revised without discredit to any one unless it has been shown that real carelessness necessitated the revision. This is in line with the conclusion reached in the discussion of the budget system before the Accounting Section of the N. E. L. A. The budget system should not be used as a club rather than as the useful tool that it is.

### Higher Distribution Voltage Should Be Studied

THE plea made by C. W. Stone before the technical session of the N. E. L. A. on Tuesday for serious consideration of the use of the 250/500-volt, three-wire system for distribution will probably arouse a great deal of dissent. Two conditions becoming evident in the distribution field may help to throw light on the discussion. The first is the tremendous investment in copper going into low-voltage systems—a tendency just now most evident in the direct-current systems because of the use of direct current in the districts with high load concentration. The other is the difficulty of obtaining the necessary substation sites for low-voltage distribution systems, this tendency also being more evident in the direct-current field.

That a tremendous saving in copper costs can be made by raising distribution voltages, as stated by Mr. Stone, is self-evident. The first tendency of many engineers perhaps will be to jump to the conclusion that the expense and difficulty of adjusting the system to cover present low-voltage appliance and lighting service will overbalance the saving. Such an opinion should not be allowed to exist without first investigating what changes will be necessary. The natural tendency to shirk a task which apparently involves many problems should not, however, rule.

The fact is that an alternative tendency with the same purpose in view is evident in the gradual curtailment of direct-current distribution that is being accomplished by cutting off the outlying fringes of direct-current districts and the carrying of higher-voltage alternating-current circuits into the heart of such districts for large power service. The elimination of copper in the low-voltage circuits is accomplished to some extent by the use of numerous step-down points from high-voltage alternating primary circuits. It is possible that there is a limit to this practice which will appear as the concentration of load increases. It will then be necessary to consider an increase of service voltages.

Mr. Stone has made a suggestion that deserves careful study. The difficulties are far from insurmountable when economic considerations justify a change.

### New Life for the Commercial Section

CHAIRMAN WILCOX of the Commercial Section is to be congratulated on beginning his administration on the wave of a renaissance. For some years it has been recognized that the Commercial Section was not meeting the fullness of its opportunity. The older men after serving as chairmen have been drifting away from the section—outgrowing it because the section itself has not advanced with its best men. Hence many problems of an executive nature that are essentially commercial have followed these older men into the other sections, and such subjects as customer ownership and public relations are no longer on the commercial program, though vital in local commercial work. E. W. Lloyd, as chairman of the nominating committee, frankly and plainly discussed this condition and, while paying well-deserved tribute to the achievements of Chairman Hogue's administration, appealed for the support of the "old guard." Mr. Hogue got behind the effort in a pcactical way by recommending that six of the ex-chairmen be made members-at-large of the Commercial Section executive committee and put into harness.

Here is a most fitting culmination of a successful year of work, during which Mr. Hogue has brought new interest to this branch of the association. The initiation of the three national co-operative programs which have been organized to promote store lighting, industrial lighting and the electric truck stand as credits to the 1923 Commercial Section. All this should prove a stimulus to all central-station sales managers, and if the Commercial Section now receives the support of the ex-chairman great progress can be made.

Here is a matter of real moment. This frank recognition that the Commercial Section today does not stand on the high plane of the Technical and Public Relations Sections is the first step in the upbuilding of this branch of the National Electric Light Association to the position of major prominence that it must fill. With this support Chairman Wilcox has a great opportunity before him.

### Inductive Co-ordination Committees Have Overcome Suspicion

THE inductive-co-ordination committee session at Atlantic City last year was called by some a "love feast." K. L. Wilkinson, engineer of foreign wire relations of the American Telephone & Telegraph Company, in reviewing the year's progress before the same committee at this year's convention, protested against the designation and styled the demonstration then an

exercise of good business sense. The meeting this year included a free discussion of two specific though hypothetical problems in which telephone and power men participated with evident enjoyment and which could have been conducted only because mutual confidence has been established.

The inductive-co-ordination problem has not been solved. In the sense that it can be laid away and forgotten the solution probably never will be found, as Prof. C. F. Scott indicated in the discussion. The thing that the session this year demonstrated was that suspicion of each other's motives on the part of power men and telephone men has disappeared and in the future the work can proceed with only the normal differences of opinion that any human relationships involve. This result demonstrates as well as any association activity the value of honest co-operation.

### Agreement Reached on Circuit-Breaker Duty

NOW that all conflicting opinions have been brought into harmony by the general agreement regarding the definition of circuit-breaker duty, manufacturers will be in a better position to furnish circuit breakers for a specified rating since they have a definite basis on which to work. It will be up to operating companies to say whether they want circuit breakers which will have a certain rating for one, two, three shots or more; and, as the electrical apparatus committee of the N. E. L. A. pointed out in its report this week, companies which buy circuit breakers on a two-shot basis will have to depend on the use of factors to determine what the rupturing capacity will be on other duty bases. Moreover, present published ratings will have to be reduced approximately 20 per cent to comply with the new basis of rating.

### A Wider Outlook in Accounting

DESPITE the handicap of a reputation for dryness which has been much exaggerated, public utility accounting has increased in interest not a little within the past few years. Last year the sessions of the National Accounting Section of the N. E. L. A. illustrated by a very diversified program the newer aspects of this analytical specialty, and the New York convention of 1923 continued the good work. The advance of commission regulation, increased demands for more accurate allocation of expenditures in operation and construction work, the need of more complete information as to the make-up of capital accounts, and the stimulus of educational opportunities, have all influenced the development of accounting toward a well-established professional plane.

This wider outlook is a good thing for the industry, for it means a closer relationship in future between its accountants and other departmental workers and executives; it means another source of executive personnel—when duly qualified—and more accurate administration of properties representing large financial values. Commission cases are going to be more thoroughly prepared because of this breadth of interest which is coming to be associated more and more with accountants. One word of caution, however, should be uttered. Accountants should develop a broader and deeper sense of proportion in their work and discussions, lest too much occupation with hair-splitting points of procedure outdo the legal profession at its meticulous worst. Accuracy in computations and loyalty to the best practice must be observed without question, but veneration for routine should not be built into a barrier separating the accountant from his engineering, commercial and executive brethren. The growing diversification of interest in accounting pursuits is a gratifying sign of the times in electric utility circles.

### Preserve Records— They Are Valuable

AN IMPORTANT note of warning was sounded during the N. E. L. A. convention by the Accounting Section committee which rendered a detailed report on the preservation of company records from fire hazard. The almost unbelievable truth was brought out that so far as known there is not a single central-station company in the country which has taken the very ordinary precaution of insuring its records. When it is realized that one little volume of a hundred pages or so may contain summarized thought and labor representing many thousands of dollars, when a few minutes' study of the question brings out the fact that it would be virtually impossible to restore such records if destroyed and that, even if they were possible of restoration, it would be only at the cost of much money and months of labor, then the situation becomes apparent.

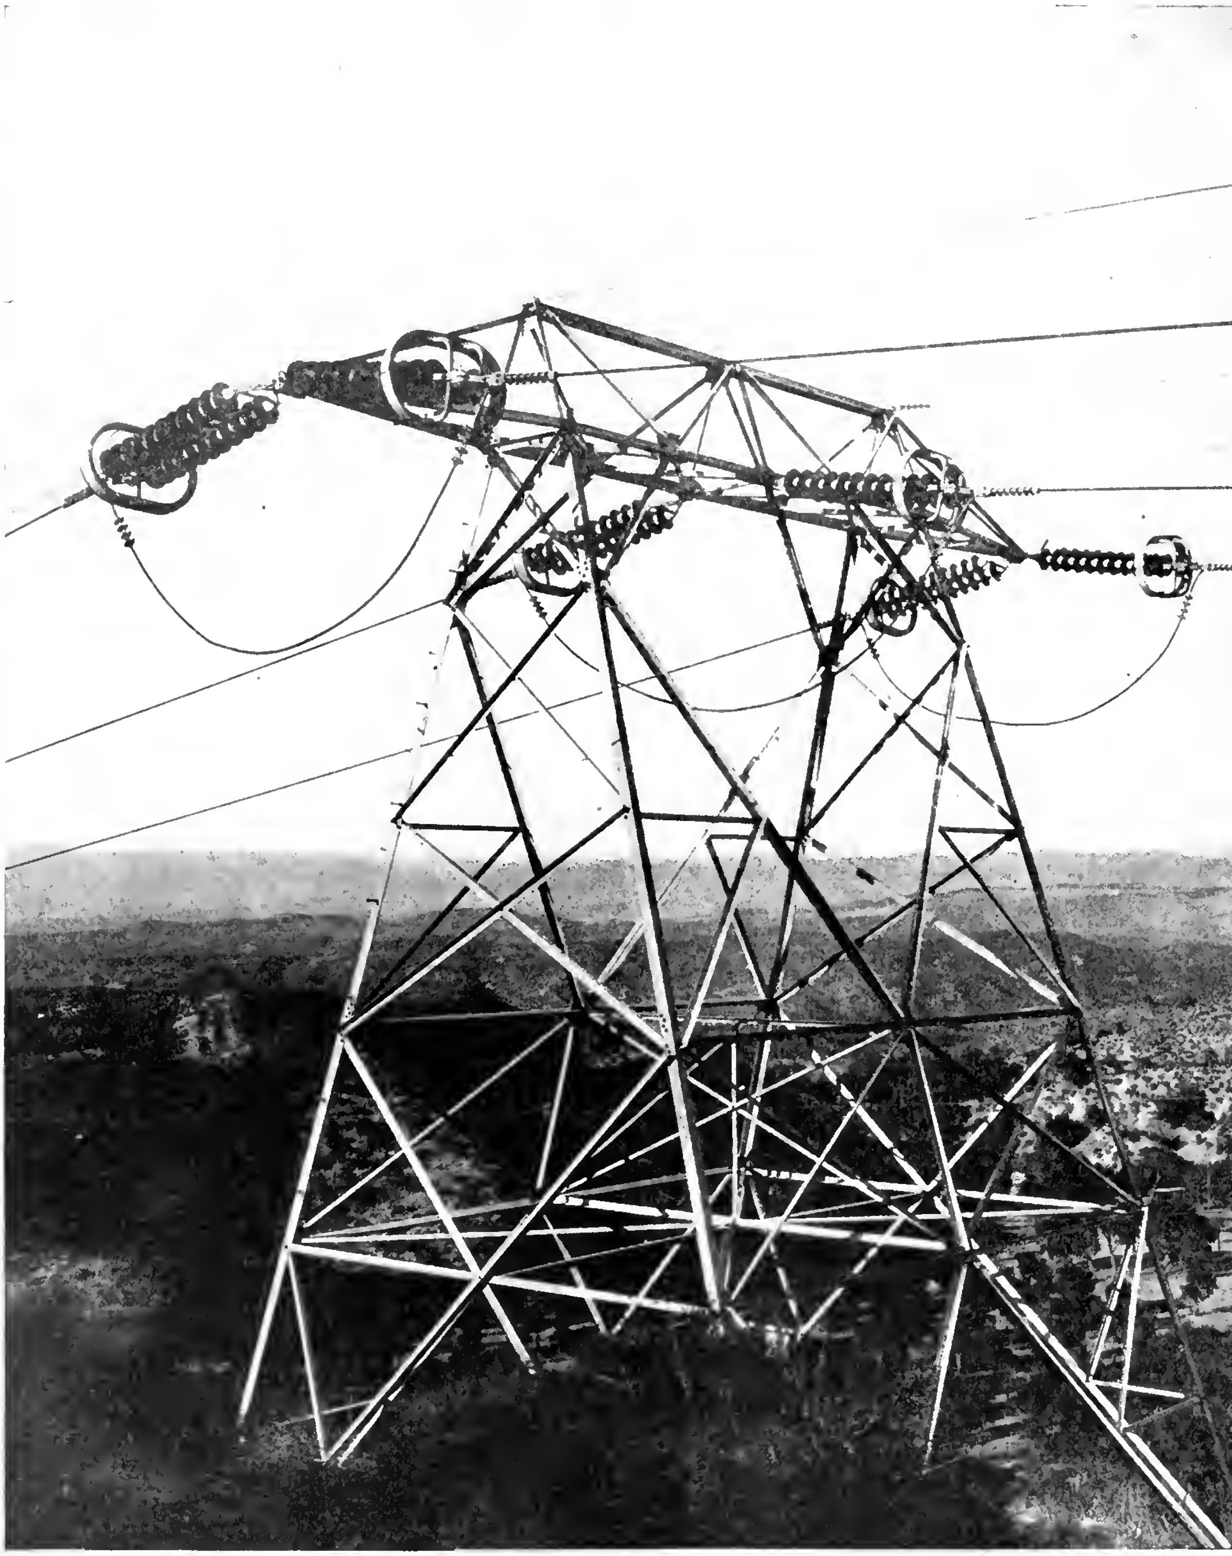
It is common practice to insure plants, office buildings and furniture. In fact, it is accepted as poor business judgment not to do so. If this is so, why should not the records, which in some cases may prove even more valuable that the plant itself, be insured? The natural questions arise as to whether the risk involved makes the rates laid down by insurance companies for such a class of underwriting prohibitive and whether the insurance companies have no classification for such a type of insurance and so will not insure. The Accounting Section committee studying this subject during the past year found the latter to be the case and that even Lloyds had not underwritten any such insurance. The national society has another task added to its schedule of activities in bringing this condition to the notice of the insurance companies. The industry has grown so fast, its history has been so short, that this important phase of company loss has been almost entirely overlooked. Insurance of records is essential to every central-station company, and the quicker it can be brought about the better for every company in the industry.

### Best Relay Practice Shortly Available to All

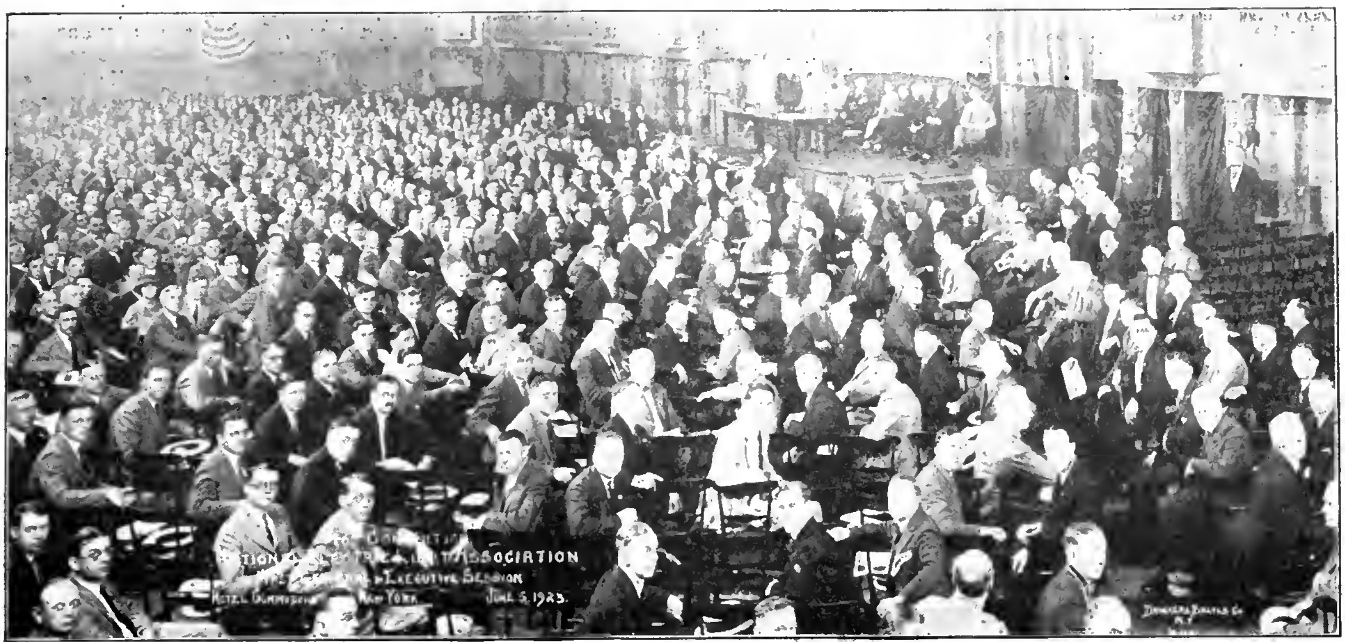
A MOST excellent treatise on relay practice in the form of the "Relay Handbook" will soon be made available in printed form by the N. E. L. A. Since control systems are the nerves of electric service plants, every company in the United States should find something of value in this compendium of practice—not theory. Much of the information which has been obtained on relay protection has been obtained through cut-and-try methods, yet operating companies which have not progressed very far in relay protection can be saved much costly pioneer work by acquainting themselves with the contents of this new handbook.

# Southern California 220-Kv. System Operating

## Is This the Beginning of a National Superpower Network?



THE Southern California Edison Company's 240-mile, 220-kv. transmission line from the Big Creek plants to Los Angeles, a tower of which is shown above, is now operating, and the supervoltage line of the Pacific Gas & Electric Company, it is reported, will be ready for operation in two or three months. Similar lines were proposed by Frank G. Baum before the N. E. L. A. this week for a national superpower network. The Southern California line, which has two 250,000-kva. circuits, is interesting aside from its voltage because of its having been converted from 150 kv. to the higher voltage. One operation involved in rebuilding these lines was to increase the tower heights, and the other required placing two additional insulators in each string and adding static or shield rings. Owing to load conditions it was impossible to spare more than a short section of each line at a time for reconstruction work.



# Record of Progress Gives Inspiration for Future at Forty-sixth N. E. L. A. Convention

THE forty-sixth convention of the National Electric Light Association, held at the Hotel Commodore, New York City, this week, in attendance, interest and scope established a new record for accomplishment in the affairs of the organization. There were twenty-two business sessions, and a public policy meeting on Thursday night. This arrangement called for four parallel sessions and all were well attended. The convention was notable for the large number of leaders of public opinion outside of the electric light and power industry who addressed the convention during the week. These included well-known newspaper men like Melville E. Stone, counselor of the Associated Press; Don Seitz, publisher of the New York *World;* Bruce Barton, well-known editor and writer, and B. C. Forbes, editor of *Forbes Magazine* and financial writer for the Hearst newspapers. Five public service commissioners from as many different states and Dwight N. Lewis, president of the National Association of Railway and Utilities Commissioners, also contributed to the program the viewpoint of the regulators.

The investment institutions of the country were represented by Lewis E. Pierson, chairman of the board of directors of the Irving Bank-Columbia Trust Company, and Richard T. Ely, professor of economics at the University of Wisconsin, spoke on closer relationship between educational institutions and public utilities. Water power was discussed from different angles by Gen. Guy E. Tripp of the Westinghouse Electric & Manufacturing Company and O. C. Merrill, executive secretary of the Federal Power Commission.

The association has made a determined effort, through rural papers and through numerous committees, to get into closer touch with the farmers of the country so as to gage their requirements as well as to inform them on certain phases of the electric light and power business. The rural-lines committee exerted its best efforts in this behalf, and in addition to its report O. E. Bradfute, president of the American Farm Bureau Federation, representing a million farmers, addressed the convention on Wednesday morning.

The chief speaker at the public policy committee meeting, held at Carnegie Hall on Thursday night, was Julius H. Barnes, president of the Chamber of Commerce of the United States of America, who dwelt on the social and economic aspects of American electrical development and the philosophy of individualism.

With so large an attendance special arrangements had to be provided for handling the crowds and looking after their entertainment. In this regard the public utility companies in the metropolitan district of New York were very generous. Through the courtesy of the American Telephone & Telegraph Company, the General Electric Company, the Westinghouse Electric & Manufacturing Company and the Western Electric Company the proceedings of the public policy meeting on Thursday night were broadcasted throughout the country. To handle the telephone messages a system capable of handling the traffic of a city of fifteen thousand people was installed temporarily in the Commodore Hotel. This constituted one of the largest private telephone installations ever undertaken.

## Opportunities of the Industry

### Need for Power Still Challenges Central-Station Companies to Supply It—National Survey Suggested—Section Chairmen Report on the Activities of the Four Big Divisions

ALTHOUGH the convention got under way on Monday afternoon, after a luncheon to N. F. Brady and an ovation to Thomas A. Edison, who appeared at the opening session of the Public Relations National Section, its formal opening took place on Tuesday morning. At that time Mayor John F. Hylan of New York welcomed the convention to the city and expressed the hope that its streets would be as brilliantly illuminated as Luna Park on Coney Island before his term of office expired.

President Frank W. Smith in his address at the opening session gave a survey of general conditions throughout the country and their effect on the elec-

trical industry. In his estimation the outlook for the electric light and power business is exceedingly promising. Electrical output, he said, has doubled every five years for the past three five-year periods, and he saw no indication of diminution at this time nor for some time to come.

"Power is essential to industry, and the growth in physical volume of production at present indicates a rate of industrial recovery almost without parallel in American business.

"This development and industrial activity have involved a great increase in the output of electric light and power companies and necessitated large outlays for new equipment and construction. During the first four months of this year the electric light and power industry raised for all purposes 60 per cent more money than it did during the similar period of 1922, indicating that for the current year bond and stock flotations will reach over a billion dollars, compared with $750,000,000 last year.

"The output of electrical energy is even more imposing. The first three months of this year show an increase over the first quarter of last year of nearly 33 per cent. Up to the present time the growth of our industry has been limited to demand. There has been for many years no great surplus of electric power.

Mr. Smith said that bankers, financial institutions and the investing public throughout the country are holding public utility securities—and particularly those of electric light and power companies—in more esteem as investment mediums than they have ever done before. This attitude is the natural outgrowth of bettered operating conditions and is due in large measure to the improvement in public feeling toward the utility companies.

## Membership

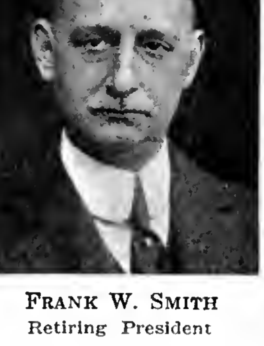
The membership committee, Howard K. Mohr, chairman, has been functioning along the lines laid down by its predecessor. The changes that have taken place in the various classes of membership during the administrative year were shown in the following table:

| Class of Member | April 30, 1923 | April 30, 1922 | Net Change |
|---|---|---|---|
| A | 1,057 | 1,134 | —86 |
| B | 8,336 | 8,110 | 193 |
| C | 111 | 93 | 16 |
| D | 219 | 237 | —22 |
| E | 1,087 | 976 | 103 |
| F | 196 | 188 | 4 |
| G | 315 | 227 | 95 |
| Foreign | 66 | 64 | 2 |
| Total... | 11,387 | 11,029 | 305 |

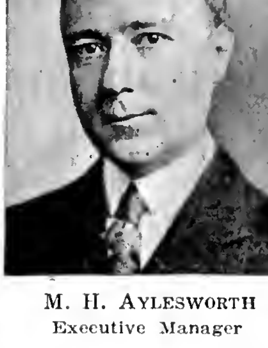
## National Survey Suggested

M. H. Aylesworth, executive manager of the association, outlined a plan for better public relations through a nation-wide survey to be made under the auspices of the national association, and the convention voted to make the plan effective at once. The purpose of the survey will be to inspect each customer's equipment at some time during the year to determine whether the service is satisfactory or not, to receive suggestions for its possible improvement, and to ascertain what appliances are in the household, and if all of these are not in use, the reasons therefor. While the main purpose of such a survey is to cultivate better public relations with customers, the by-products are, in Mr. Aylesworth's opinion, of inestimable advantage.

"While we have been making great effort to obtain popular support by enlisting financial co-operation through customer ownership and are giving excellent service to customers in so far as they utilize the service, it must be appreciated," said Mr. Aylesworth, "that empty lamp sockets earn no dividends, nor does household apparatus that is not in use."



FRANK W. SMITH
Retiring President



M. H. AYLESWORTH
Executive Manager

To serve well and ever better has long been the object of the electric light and power companies, for service and success are synonymous. But have we convinced our customers of this fact? Are they satisfied with our service? Do they believe in our sincerity, or are they skeptical and hostile, basing their unfriendliness on little things that could easily be put right, or founding it on ignorance of our methods and exaggerated notions of our earnings?

"Wonderful as have been our success and development, such a national survey under the guidance of your association offers still greater opportunities for service."

## Chairman Sands' Report

In reviewing the work of the Public Relations Section, Chairman H. T. Sands pointed out that central stations as an industry have been peculiarly lax in spreading the public utility gospel from the speaker's platform. "I know of no industry," said Mr. Sands, "which has a better story to tell or a story that will prove more interesting to the public when rightly told. Furthermore, the work of the speakers' bureau forms a splendid auxiliary to the work of the state committees, for invariably, whenever a public address is made before civic bodies, the local newspaper devotes very liberal space to publishing that address, and in this way the maximum amount of publicity is obtained.

"Under the direction of the Public Relations Section, two films, 'Back of the Button' and 'Yours to Command,' have been produced and quite generally distributed among our member companies. This distribution, however, falls short of what it should be. Here again our industry shows a peculiar trait of reticence, and almost an inability to understand the public mind.

"In the prosecution of its work," continued Mr. Sands, "the section has been somewhat handicapped owing to the character of its purpose. In the main we are dealing with intangible factors in the prosecution of our work, but we are, nevertheless, able to observe certain tangible results, and it is our belief that these results will become more and more apparent as the work goes on. Our greatest obstacle in securing these results lies in the apathy and indifference of many of our own company executives. Absorbed in the technicalities of their business, deeply interested in the rapid strides which the industry is making, they seemingly fail to realize that the public mind has not kept pace with the changed conditions of the industry, and they are not bidding for that intelligent understanding on the part of the public that makes for mutual confidence and spells success."

Mr. Sands regretted that some executives look upon public relations as a beautiful theory but without practical value. But public relations, he said, are neither a theory nor an idle dream. They are a pressing reality, the central station's greatest asset, to realize which should be the chief concern of executives.

## Broader Engineer Viewpoint

"Altogether too much emphasis is put on the names of the sections," declared R. F. Schuchardt, chairman of the Technical Section, in his address on the opening day of the convention. "There seems to be a feeling that the main purpose of these sections is to concentrate entirely on the problems of the section. This view tends very much to develop specialists of the limited-view type which some of our philosophers think is actually endangering civilization. We should make every effort to see that these specialists are of the broad-visioned type who not only work out the solutions of their special field but who also consistently remember the relation of this field to the rest of the industry. The danger is perhaps greater in the so-called technical field

JOHN BRITTON
First Vice-President

J. E. DAVIDSON
Second Vice-President

R. F. PACK
Third Vice-President

H. T. SANDS
Fourth Vice-President

**Four Vice-Presidents Elected to Serve with President Johnson**

as distinct from the so-called commercial. Technical operation is successful only when the commercial phases receive due consideration. Would it not be well for all of us to encourage the sections to emphasize the 'relation to the industry' phases of their work a little more and the self-contained unit idea a little less, and would it not also be well to bring the sections together for joint consideration of problems at as many points of contact as possible?"

A word was also addressed to executives who have not yet given much thought to the value of N. E. L. A. committee work and who do not fully realize the intimate relation existing between the work of their technical staff and their dividends. "In addition to the valuable information obtained from these committees," said Mr. Schuchardt, "they offer an advantage of even greater value, namely,. as training schools for your men, as a means for developing and inspiring your executives of the future. Here these men have the benefit of the broadening influence of meeting with others who are working on similar problems. With the well-organized plan of geographic divisional committee work and its coordination with the national committees it should be easy for every member company to partake of the benefits, even to the smallest companies.

"During the past months a new scheme of distribution for the information gathered by the committees has been worked out which should prove very satisfactory. It will get the reports promptly to the men interested and will greatly simplify convention reports." In general, this will be accomplished by making committee work a continuous function. Reportswill hereafter be made throughout the year and distributed in "homeopathic doses" so as to reach promptly those who are interested. "Executives receiving these reports will naturally refer them to those in their organization who can use the information most effectively for their company," added Mr. Schuchardt.

"The engineers who have caught the spirit of progress, as those must who act on these committees, appreciate that they are serving well only if they strive constantly to use the nation's resources in a manner which best conserves the interests of their fellow-men. They study the best engineering developments all along the line, think ahead, build and operate so that our product—electricity, the lifeblood of industry and the new servant in the homes—may be provided most economically and satisfactorily."

### Promising Outlook for Commercial Expansion

Oliver R. Hogue, chairman of the Commercial Section, in his address said that the central station company's opportunity to increase its income has never been better in the history of the electrical industry than at the present moment. There is a marked improvement in station capacity; the financial situation is materially better; the opportunity for greater expansion is at hand. Commercial departments are reorganizing their selling forces and striving to improve their efficiency. Others who had abandoned commercial activities are reorganizing their commercial staffs.

The question of public relations is squarely up to the commercial man. The salesman who sells proper equipment and appliances to the customer without misrepresentation, will build up right feeling and understanding with customers, who in turn will buy goods and make investments, stalling plans for public ownership.

### Adoption of Uniform Accounting

Calling attention to the very satisfactory progress made during the past year in the adoption of the uniform classification of accounts by public utility commissions of sixteen states, William Schmidt, Jr., chairman, summarized briefly the work of the Accounting National Section. His detailed report was presented in full at the first accounting session.

# Water Power and Rural Service

**National Importance of Adequate Development of Hydro-Electric Resources by Private Initiative—The Farmer Looks to the Electrical Industry for Service**

TWO papers were presented at the Wednesday morning session on water-power development—one by John A. Britton of the Pacific Gas & Electric Company, reporting for the water-power development committee, and the other by Gen. Guy E. Tripp of the Westinghouse Electric & Manufacturing Company. Mr. Britton traced the phenomenal interest in water powers and in their development since the passage of the federal water-power law and showed by statistics the horsepower and cost of the work now under construction in this country. He also showed to what an extent the United States exceeded all other countries in the amount of water power developed.

### Tripp Predicts a New Era of Development

"In striking contrast to all other public utilities, the electric light and power industry, I am convinced, is about to enter into a new era of development," said General Guy E. Tripp, in his address before the public policy session. The railway, telephone, telegraph and gas industries have, he said, become settled enterprises. They will continue to grow as the country grows and will from time to time improve their methods, but in all probability none of them will be called upon to furnish a radically new kind of service to meet the increasing requirements of our highly organized social life. But with electric power the case is quite different. Power is the basis of civilization. Without it men could not have emerged from barbarism. Nor can we make any progress except when notable improvements are made in our power supply. In order adequately to develop this power supply, the so-called superpower systems must be made accomplished facts. These systems will

utilize all the water powers that are available for economic development. They will render service more reliable and will allow steam-power plants to be built in the most economical and most suitable location.

These superpower systems, General Tripp said, will become vital to our national prosperity, and they must of necessity be monopolies; but also they will be shining marks of the advocates of government ownership. It so happens, however, that, regardless of the merits or demerits of the theory of the public ownership of the utilities as an abstract proposition, the government ownership of a power system of this magnitude is impracticable. Superpower systems must have no political boundaries, and any attempt to keep their lines within arbitrarily chosen limits will merely result in destroying them as superpower systems and depriving the public of the chief economic advantages that they offer.

National ownership, on the other hand, may at first sight seem entirely feasible, but analysis shows that great difficulty exists here also. In the first place, the authority of the federal government does not extend beyond national lands, boundary waters and navigable rivers. It could not, under present laws, control the power developed by non-navigable streams, to say nothing of the necessary steam plants. Any attempt on the part of the federal government to extend its control would be promptly resisted by the states with the support of public opinion, which sees danger to our republic in the growing tendency of the federal authorities to interfere in local affairs.

Therefore, if the nation is to have superpower systems, they must be built by private capital and operated by private companies. Government ownership in any form would be fatal to that development and disastrous to the best interests of the public.

Each new municipal plant that goes into operation and each new obstructive state law, like that of Maine, prohibiting the export of water power, presents one more obstacle to the completion of the general plan. It is most pleasing to note the broad-minded water-power policy of Governor Pinchot of Pennsylvania, and it is encouraging to remember that the New York State Legislature did not adopt the policy of hoarding the state water power. But, nevertheless, there is altogether too much sentiment in favor of the government ownership of electric light and power utilities, and especially of water power, and the growth of this sentiment can be stopped only by making the people clearly understand the fundamental policy involved in it and by proving by service that private ownership and operation is, from the standpoint of the public, the better way.

### Rural Lines

The rural lines committee (G. C. Neff, chairman) paid less attention to rates and financing of lines than to the use and value of electric service on the farm, for it is believed that if sufficient use can be made of central-station service, the rate and financing problems will automatically take care of themselves.

A meeting was held with representatives of the United States Department of Agriculture, American Farm Bureau Federation and American Society of Agricultural Engineers, and a comprehensive study of the farm power problem was outlined.

The various interests represented perfected the organization of a committee on electricity as related to agriculture, with J. W. Coverdale of the American Farm Bureau Federation as chairman and G. C. Neff, chairman of the rural lines committee of the National Electric Light Association, as secretary.

The following investigations are to be carried on under general supervision of this committee: (1) Farm power survey; (2) survey of central-station and isolated-plant services to farmers; (3) survey of agricultural uses of electricity in foreign countries; (4) experimental and research work on the uses of electricity in agriculture.

The report presented a series of tables and a detailed discussion of the cost of rural electric service and methods of charging based on experience in territory served by the Union Electric Light & Power Company of St. Louis.

There are three things that have hampered the development of farm stationary power:

(a) At present there is very little farm machinery made that has been primarily designed to be used with the electric motor.

(b) The farmer, on account of being pressed for time and because of the character of his equipment, has had to devote almost his exclusive attention to any machine that happened to be in use.

(c) While much work has been done by the experimental stations in running tests, the machinery for getting this information to the farmer has not been set in motion.

The inquiries of the committee brought to light many subjects that should be investigated. Field power is used abroad, but has not been used much in this country. The electric truck for farm use and short hauls would seem to be worthy of consideration. Experiments show that electricity is of value in fertilization of fields and that it can be used in sterilization to stop bacterial action in silos.

From the comparatively small amount of work and investigation which had been achieved, the committee was of the opinion that with the development of proper electrically driven farm equipment and machinery a greater use will be made of electric service by the farmer, which will result in larger profits to him and to the utility which serves him. During the development period it will be necessary to treat the rural electric service as a special service and it is well to have specific rules covering the supplying of rural electric service, and as a guide to these rules the committee recommends a study of the various rules shown in last year's and this year's report. These rules, however, are of a temporary nature and can be eliminated when rural electric service has developed to a point where the revenue received bears a ratio to the investment comparable with the same ratio in urban business.

### What the Farmer Seeks

One of the most interesting talks of the week was that given by O. E. Bradfute, president of the American Farm Bureau Federation, an organization representing a million farmers. Mr. Bradfute said that there was invested in the farms of this country eighty billion dollars and that the value of the food products raised yearly ranged from twelve to fifteen billion dollars. As indicative of the viewpoint of the farmer toward the question of electrical supply, Mr. Bradfute said:

"No one who was not born and reared on the farm can realize what it means to the farmer and his family when for the first time he presses the button and sees his home, lawn, barns and yards suddenly spring from darkness into a full noonday light and the activities of the farm take on, as it were, new life. When the farmer's wife enjoys the experience of the electric sweeper, full electric laundry equipment and the sewing-machine motor, and the family has the experience of a modern bathroom and the convenient kitchen sink with hot and cold water under pressure, these things alone give a trial of electricity which they will never after be willing to surrender, because it makes it possible for the farmer to have all the modern equipment in his home that may be found in the best city homes, and he feels at last that he has an even chance with his city brother in the social comforts of life. This simple test of electricity in his home leads him on with deeper interest as he begins to think of the possibilities of electricity if it could only be harnessed for general farm purposes.

"It is claimed," said Mr. Bradfute, "that modern farm machinery has increased the efficiency of the American farmer 20 per cent in the last decade. It is not unreasonable to expect a similar increase in efficiency in the next decade, and we no doubt should expect electricity to play an important part in accomplishing that result."

Speaking of water power, Mr. Bradfute said: "God has equipped America with many fine rivers and streams well scattered over the entire country. He must have had in mind the electrical age and surely intended that we should harness that great power now going to waste and wisely distribute it to all the people.

"I believe that a great majority of the farmers who own and live on their own farms believe in private ownership of public utilities under reasonable and fair regulation rather than municipal, state or federal ownership."

### Merchandising Policy

A detailed analysis of the profit and loss entailed in the appliance merchandising operations of eleven central-station companies covering the first three months of this year was presented by John F. Gilchrist, chairman merchandising policy committee, this being a study supplementary to the statistics which were published last year by the joint committee on merchandising policy of the N. E. L. A. and the Edison Association. The Accounting Section at the committee's request prepared a revised classification of accounts and appointed a sub-committee to supervise the installation of this system in the eleven organizations which are cooperating in the analysis. The figures presented are approximate for the first six weeks while the system was being developed, but for the rest of the term are accurate and by the end of the year will provide a very exact statement of the merchandising experience of these companies.

The net sales of these eleven companies were $1,892,935.45, which represents 100 per cent of sales income. The gross profit, or excess over the cost of material in the dealers' warehouses, was $587,616.32, or 31.1 per cent of the net sales income. The total selling expense of the eleven companies was $422,360.65, or 22.2 per cent; the general expense $358,038.36, or 19.0 per cent; the fixed charges $39,540.71, or 2.1 per cent, and the net loss of the group, after deducting the gain of those companies which show a gain from the aggregate losses of those which show a loss, was $232,323.40, or 12.2 per cent.

The margin over cost of merchandise is greater than the corresponding figure obtained approximately one year ago from the same group of companies. In the opinion of the committee, this indicates two things—that the companies themselves are appreciating the necessity of withholding goods from their counters which cannot be bought at a price to yield them a fair margin above cost of merchandise, and that manufacturers and jobbers are rapidly awakening to their own interests and are readjusting their prices so that retailers may enjoy more of a margin between the list price established by the manufacturer and their costs.

Average sales expense may be slightly larger than expected by most students of the situation, but it is probably more nearly as expected than the 19 per cent representing the general expenses. On the other hand, with more information gained from this cost-accounting record as the months go by, it is quite likely that the item representing general expense will increase more rapidly than that representing sales expense, as it is in the general expenses of the business that the expenses of merchandising are to the largest extent absorbed by the other branches of the utility business.

The committee believes it must be apparent to all who have made any study of this question that the margin over cost of merchandise is insufficient, when the cost of securing the proper volume of business which a territory should properly yield is taken into consideration.

These figures are calculated on the basis of what the normal costs would be if this merchandising business were being conducted as a separate enterprise and not as a department of a central-station company.

### Company Employees' Organizations

This committee, of which Robert B. Grove is chairman, expressed its belief that the national association can function in a valuable way by endeavoring to render service to employees of class A members and to managers of class A member companies in their relationships with their employees, and further, that this function can best be performed by a national general committee composed of members broadly representative of employee organizations.

The committee hoped that the action of the national executive committee on the recommendations of last year's committee would be favorable to the development of company sections and, in any event, recommended that the preparation of the suggested handbook be undertaken.

The El Paso company section of the N. E. L. A., El Paso (Tex.) Electric Railway Company, was formed during the year, and the United Electric Light Company of Wilmerding, Pa., requested authorization of the national executive committee to form a section.

### Publicity for Public Utilities

Melville E. Stone, counselor of the Associated Press, spoke of the proper relation of public service corporations to the newspapers. He intimated that there was no reason why public service corporations should not be proud of their work and admonished his hearers to play a fair game and not be moved from a course of rectitude by the blackmailing legislator or menacing newspaper. Mr. Stone said the jury which will pass on the merits of the case is the public and the public is not easily fooled, nor is it disposed to be unfair. Before such a jury the rascally editor has just as much to lose as the utilities. He was opposed to purchasing favorable editorial comment with useless advertising. "If you have occasion to advertise," said Mr. Stone, "do it on purely business principles; that is, advertise with a newspaper when and only when you are seeking a legitimate return. Never advertise merely as a sop. Such advertising is discreditable alike to the utilities and to the newspaper man. It always arouses a suspicion on the part of the discerning reader that you are seeking something you should not have."

Mr. Stone expressed himself as opposed to government ownership on economic grounds. Government ownership, he said, has been often tried and almost always proved expensive and inefficient. He believed, however, in honest and intelligent governmental regulation and said it was silly to attempt secrecy in the conduct of a public service corporation.

# Commissioner Dwight N. Lewis Speaks

## President of National Railway and Utilities Commissioners Voices that Association's Belief in Private Operation—L. E. Pierson Gives Banker's View of Utility Management

AN ADDRESS by Dwight N. Lewis, president of the National Association of Railway and Utilities Commissioners, was a feature of the third general session, which was all devoted to public opinion and executive relation to some of the newer phases of utility management. How to reach the public through the schools or universities was one point emphasized.

### Private Ownership Preferred

Mr. Lewis said that he was conscious of speaking to trained men representing billions of capital and a public service that has rapidly been metamorphosed from a luxury to a necessity. He said that many state commissions are still on trial, and this past winter has brought forth determined efforts on the part of some people to have utility commissions abolished. Bills were introduced in many legislatures to bring such abolishment about, but the legislatures have all adjourned and the ranks of the utility-regulating commissions are still unbroken.

Much of the discontent with state-regulating commissions arose because of the fact that war-time conditions made it imperative that rates in some instances be advanced. Increased cost of coal, materials and labor made changes in rates absolutely necessary. "It may be said to your everlasting credit," said Mr. Lewis, "that electric utility rates did not advance in the same measure that other prices advanced during the war period of high prices."

According to Mr. Lewis, there is yet a considerable portion of our population who believe in municipal ownership of public utilities. "I am," he said, "a firm believer in public ownership, in consumer ownership, of a private company efficiently operated in the interest of the consuming public as well as the owning public. The government should concern itself with purely governmental affairs, protecting both persons and property in their constitutional rights, and leave to private capital and initiative the advancement of business affairs. The rights of the public may always be secured by proper oversight and regulation, and this

should not go so far as to destroy incentive for investment of capital and talent.

"I am informed that many towns in my own state, tiring of the burden of municipal ownership, are discarding their expensive and obsolete plants and are obtaining their supply of electricity from central distributing plants, much to their pecuniary profit and satisfaction in service. There is every

DWIGHT N. LEWIS
President National Association Railway and Utilities Commissioners

reason to encourage the building of super-power plants. More efficient management and operation, conservation of fuel and lessened overhead expense mean better service at less cost to the consumer."

## Conservative Expansion Recommended by Customer Ownership Committee

That the great and growing customer-ownership movement may go forward under sound policies, member companies pushing this invaluable work should at all times keep it in conservative control, the customer ownership committee, through its chairman, M. R. Bump declared. During 1922 it is estimated that electric light and power securities totaling $175,000 000 were placed in the hands of customers, compared with $80,000,000 in 1921, and this year it is probable that the aggregate total of customer ownership sales will reach a quarter of a billion dollars. The committee wished to go on record as to the necessity of conservatism in the creation of issues in every reasonable way in order to prevent the possibility of a failure of any of these securities to pay dividends regularly. A comparatively small number of such failures would do an enormous amount of harm to the customer-ownership movement as a whole.

In the past eight years at least 425,000 customers have been attracted to the possibilities of investing in local company securities. The gain in numbers is extremely rapid, and it is estimated that within three years at least one million people will own the securities of the electric companies serving them. The committee recommends that the incoming administration give serious consideration to the preparation of a series of statements to customer-owners that will broadly outline the economics of the utility situation and help in an educational way in the solution of the industry's problems. To overcome the indifference of customer-owners in some localities, it is recommended that group meetings in convenient neighborhoods be held from time to time where company executives may meet with customer-owners and discuss their problems, and that attractive company booklets and statements be sent these customer-owners at stated intervals.

The committee feels that it is undesirable for any company to guarantee the future market price of securities sold. Every company should attempt to maintain at all times an active market for the resale of securities. The cost of distributing securities is becoming lower each year. The committee recommends that the sales manual be revised to date.

DATA ON CUSTOMER OWNERSHIP
(Summary of information from 156 Electric Light and Power Companies)

| | |
|---|---|
| Total population of territory served... | 40,899,096 |
| Total number of customers.......... | 7,698,313 |
| Gross earnings of combined companies reporting .................... | $555,553,901 |
| New stockholders obtained from customer-ownership plan............ | 426,495 |
| Shares of stock sold under customer-ownership plan*.................. | 3,449,185 |
| Percentage of sales on deferred-payment plan (average).............. | 32.5 |
| Percentage of stockholders obtained through customer-ownership plan to customers..................... | 5.5 |
| Average cost of selling per share as reported by seventy-five companies† | $4.39 |
| Ratio of stockholders to population.... | 1 to 95 |

Shares sold to customers, 780,438; employees, 150,511; others, 125,491.
(Only fifty-eight companies reporting on this item)

SUMMARY BY YEARS

| Year | Shares of Stock Sold* | Stockholders Obtained |
|---|---|---|
| 1914 | 92,310 | 4,044 |
| 1915 | 57,103 | 4,357 |
| 1916 | 38,057 | 3,681 |
| 1917 | 79,348 | 7,470 |
| 1918 | 30,783 | 4,115 |
| 1919 | 166,096 | 20,840 |
| 1920 | 416,089 | 62,885 |
| 1921 | 802,845 | 118,177 |
| 1922 | 1,750,707 | 198,018 |
| | ‡3,433,338 | ‡423,587 |

* Stated in par value of $100 per share.
† In report of average cost of selling the lowest was 5 cents per share, which included postage and printing circular letter. The largest amount was $9.64 per share, including commission, advertising, transportation, general office expenses and salaries.
‡ These totals do not check with the summary above because of the fact that some companies failed to list the data by years.

## Utility Management

If the electrical utilities were to cease functioning for a single day, said Lewis E. Pierson of the Irving Bank-Columbia Trust Company of New York, modern life as we know it would come to a sudden halt.

In this fact lies the basic reason for the interest of the public in the conduct of the electrical industry and for the public's right to demand that the industry shall be efficiently and intelligently administered.

On the other hand, the same fact places a great and pressing duty upon the industry—to protect itself from the imposition by the public of policies and theories the result of which would be to cripple the essential instruments of public service.

The world's experience with public utilities is comparatively brief. It has experimented with various forms of government for thousands of years and as yet has evolved nothing which even approaches perfection. The sum total

LEWIS E. PIERSON
President Irving Bank-Columbia Trust Company

of its knowledge of public utilities covers less than a century.

Thus far three major ways of managing and operating public utilities have been attempted: First, private ownership and operation without governmental regulation; second, public ownership and operation; third, private ownership and operation subject to governmental regulation.

The first two have proved to be undesirable in a number of ways. Public ownership and operation, however, has in practice proved even worse than private ownership without regulation. Out of the failure of government ownership and operation and the disadvantages of unregulated private ownership and operation has been evolved the third method of dealing with public utilities, namely, private ownership and operation subject to regulation by a commission representing the public.

In theory this method presents the most effective method yet devised for safeguarding the administration of public utilities. Practice has proved what theory indicated. Wherever the commission idea has had a fair trial through the appointment of officials of intelligence and character service has improved and the utilities have made progress. The electric light and power industry is today contributing to the comfort and prosperity of the country nineteen times as much as it contributed twenty years ago.

## Education and Research

In an address on this subject Richard T. Ely, professor of economics, University of Wisconsin, told of the possibilities for a better government and a better civilization through having the youth of the nation better educated in the fundamentals of the great utility business.

"I know something," he said, "of the vision as well as the achievement of the men in the electric lighting field. But we are only at the beginning. Farm and factory, homes in city and country, are going to receive increasingly the benefit of the growing marvels of electricity."

In Dr. Ely's opinion it is a privilege that educators may well crave to help realize the vision which animates the spirit of the leaders in the industry.

### Accident Prevention

In reporting for the accident prevention committee, its chairman, Charles B. Scott of Chicago, said that accident prevention in the electrical industry has passed from the experimental stage into one where it is an integral constant factor in every operation. Detailed reports were made on educational courses, resuscitation, health promotion, suggestion systems, usefulness of statistics, radio hazards, automobile hazards, grounding and its relations to accident prevention, locking doors in high-tension compartments, electrical apparatus and risks peculiar to hydroelectric plants. Mr. Scott said that these reports should be useful to the supervisory forces of member companies and recommended that they be placed in the hands of key men and be made a part of operating plans.

### Great Savings in Insurance

E. Wolff, reporting for the insurance committee, gave an excellent account of the work of the committee and the large savings in insurance premiums which it was able to effect. He recommended that the insurance activities of the association be consolidated under the direction of a member of the headquarters staff in order that such work may be fully co-ordinated.

The reduction in the fire insurance was approximately 25 per cent and for auto-trucks 31 per cent. From reports received from ninety-one companies a saving in premiums of $103,769 was reported. The lowest reported was $25 and the largest approximately $25,000, the average being $1,140.

President Smith, in referring to the committee's work, said that through its activities it had been able to save to member companies a sum of money exceeding the annual dues which these companies paid into the association.

### Army Engineers Co-operate

Reporting for the committee on electrical resources of the nation, M. S. Sloan, president of the Brooklyn Edison Company, told of the co-operative work of the Great Lakes Division, N. E. L. A., with the Chief of Engineers of the United States Army in compiling basic information on the electrical resources of that division. Mr. Sloan recommended that the government be provided with an accurate statement of present resources as well as an estimate of prospective growth, so that in time of shortage such as existed in 1918 definite and accurate information will be instantly available.

### Simplification and Standardization

Gen. George H. Harries indicated in his report of the committee on contact with the Department of Commerce just what can be accomplished by unification of effort in any industry. The survey of waste in industry showed the need of elimination of losses, and Secretary Hoover in seeking a man to head his department for simplification naturally took him from the electrical industry, which for economy and reliability's sake has practiced simplification for years.

### President Smith Commended

John W. Lieb, reporting for the committee on the president's address, commended President Smith for the unusual grasp of the problems of the association and details of the industry which his report indicated he possessed. The intimacy showed in his review of national and geographic section work, Mr. Lieb said, was gained by personal contact and proved the desirability of having officers and members of the staff headquarters making observations in the field. The committee commended the survey of general conditions made by Mr. Smith, stating that it sounded a note of confidence and optimism concerning the industry's future.

### Memorials

The report of the committee on memorials was made as usual by W. H. Onken, Jr., editor of the ELECTRICAL WORLD, and as a mark of respect the convention stood with bowed heads for a moment in memory of those who died during the year.

# The Utilities and American Initiative

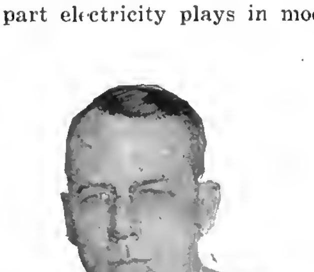
**Public Policy Session Listens to Julius Barnes and to Public Policy Committee Report—Charles A. Coffin Medal Awarded to Southern California Edison Company**

A LARGE audience was present in Carnegie Hall Thursday night to listen to the address of J. H. Barnes, president of the Chamber of Commerce of the United States of America, and to the report of the public policy committee, of which Martin J. Insull of Chicago is chairman. This report is given in abstract elsewhere in this issue.

The serious portion of the program was preceded by organ selections by M. E. Schwartz and by songs sung by Miss Anna Case. From a popular standpoint great interest centered in the meeting because of the remarkable use of radio broadcasting.

### American Inspiration and Initiative

Mr. Barnes' talk was highly inspirational and instructive. He told of the great part electricity plays in modern



*Clinedinst, Washington, D. C.*

JULIUS H. BARNES
President United States Chamber of Commerce

life and in individual production, and was insistent on the prerogatives of American traditions and institutions and on the exercise of private initiative and enterprise in the operation of public utilities and in the conduct of business in general.

The speaker indorsed state regulation of public utilities and paid a glowing tribute to the electrical industry of America. The fairy tale of modern industry, he said, lies in the area of American electrical development.

When the great truth is grasped that the standard of the average home possession is only surely raised by producing more and more of the articles of common use to divide among these homes, then we get the human meaning that is shown almost without exception in all American industry under this typically American philosophy of larger and cheaper production.

The American philosophy may be fairly called the philosophy of fair play: that the individual shall not be deprived of his opportunity for superior accomplishment and superior fortune by the rigid and blind processes of a government which injects itself into natural processes, with disastrous results, nor deprived of that rightful opportunity by strong combinations of either influence or of wealth, or of monopoly created by government favor.

In the preservation of this field of fair play there has developed as the proper relation of government to private industry the American theory of regulation. America recognizes that free and open competition is the great safeguard to individual opportunity, and when for any reason the play of competition is checked, then the organized authority of society must, in the very preservation of fair play, interest itself.

It is manifest that, when the supreme authority of the state is called into play to secure rights-of-way for power transmission, or for transportation across reluctant private property, there is set up a peculiar obligation toward the established constitutional authority

which exercises that right of organized government over individual opinion and preference. So that the policy of regulation is one which is approved by common sense and grounded on the American passion for fair play and equal opportunity.

But, as always in the exercise of supreme public authority through public servants, who are but human, we have passed through phases which require correction. In our own self-preservation such regulation must be fair and even generous. We must preserve in publicly regulated but privately owned services the field of opportunity which attracts the superior grade of ability and resourcefulness.

It is only in the domain of public utility service and its regulation by constituted authority that we have failed to grasp fully the principle that that regulation must preserve the divine individual stimulus which inevitably translates itself into enlarged human convenience and happiness. This policy of regulation is in the stage of evolution. It must be tested in this direction and that. Abuses must be eliminated and the stimulants preserved and developed. Experimentation matters not so much if only that policy of regulation shall be animated by a public conception of its own self-interest and of the spirit of fair play which shall interpret the relation of government to this great industry.

### Public Policy Committee

Martin J. Insull, chairman of the public policy committee, presented the report of the committee. The ideals of the industry as set forth in the report were loudly acclaimed and applauded by the audience. An extended abstract is given elsewhere.

# Water-Power Development and Coal Storage

**Secretary Merrill of Federal Power Commission Discusses Hindrances to Hydro-Electric Progress—Lieb on Coal Storage—Wiring Changes and Lamp Developments— Johnson Elected President**

O. C. MERRILL, executive secretary, Federal Power Commission, in an address which was listened to with interest and warmly applauded, placed emphasis on certain tendencies which retarded development. He stated that new construction already completed or involved in projects upon which construction has already started aggregates 1,470,000 hp. of proposed installation. The aggregate total of estimated installation in the 173 projects for which permit or license has been issued is 7,600,000 hp. Tracing the marked change which has taken place with respect to the development of water power on navigable streams, which for fourteen years preceding the present law was virtually at a standstill, Mr. Merrill showed that on navigable streams alone 2,000,000 hp. is under construction or applied for.

He made it plain that at present there is no surplus power and that despite that fact and the urgent necessity of greater water-power development in the East, the greatest water-power source in the country, the St. Lawrence River, is running to waste and the second greatest potential source, the Colorado River, is likewise unused because of conflicts over jurisdiction caused by interstate jealousies, by strife between the advocates of public and private ownership, by existing or prospective embargoes on power transmission or by restrictive action by state legislatures.

Touching on the situation at Muscle Shoals, Ala., Mr. Merrill said that the nation has in the federal water-power act established a definite national policy, representing the mature judgment of Congress and the consensus of public opinion. He intimated that it is necessary to safeguard that law from attack if maximum and proper development of the water-power resources of the nation are desired.

### Coal Storage Recommended

Reporting on the activities of the joint fuel committee during the recent coal and rail crises, John W. Lieb of New York, its chairman, told of the relief given to 225 companies which sought the assistance of the committee. He strongly urged member companies to store coal to the limit of their capacity so as to safeguard the service and at the same time relieve as much as possible the railroads of the company at the time of their peak loads. He also expressed the hope that public utilities would make contracts for their coal requirements and intimated that possibly public utilities might receive preferential treatment from Washington on contracts of this kind, insuring full delivery before operators could sell spot coal.

### Wiring Methods

Standardization of appliance plugs and prongs, changes in the National Electrical Code, polarization of portable devices, tests of heater cords and improvements in wiring methods were particularly noted in the report of the Wiring Committee (R. S. Hale chairman) this year. At present, the committee declared, it is not desirable to insist that appliance prongs shall be of the same design for all classes of appliances.

Some of the advantages of the solid-neutral, 15-amp. fuse and 660-watt rules recently adopted by the National Board of Fire Underwriters, were outlined by the committee, which has been advocating them for some time. The principal benefit emphasized is the saving in installation cost in all new construction, of which there is an unprecedented amount going on this year. The solid neutral will make easier the use of a consolidated neutral or neutral bus in apartments, and office buildings with meters in the basement and numerous circuits.

Among subjects which the committee suggested for future work are the following: Listing and discussion of new methods which are improvements on present practice but are not of a nature

# Growing Customer Ownership

**Distinguished Leaders of Thought and Action Portray Accomplishments in This Direction and Point to Promising Future for the Policy**

THE triumphs of customer ownership during its short career of nine years and the remarkable opportunities of the future in this branch of public relations work were set forth at the session of the customer ownership committee on Thursday afternoon, under Chairman M. R. Bump. The committee report emphasized the extremely rapid growth of this movement since the war and urged a continuance of the sound financial methods which have been so great a factor in its success throughout the country. John A. Britton, vice-president Pacific Gas & Electric Company, San Francisco, reviewed the rise of customer ownership from its inception by that company in 1914, pointed out its invaluable aid in the defeat of the California state water-power act at the 1922 election and described with telling force the bearing right public relations exert upon utility development. B. C. Forbes, editor *Forbes Magazine*, New York, gave an optimistic address upon the future of customer ownership and private management, urging continued care as to the quality of security issues offered to the public. E. K. Hall, vice-president American Telephone & Telegraph Company, New York, pictured the undeveloped investment field of the country and its attractiveness as a source of fresh capital for electric utilities. He urged making the utmost of the opportunities to develop friendly relations between utilities and owner-customers.

Louis H. Egan, president of the Union Electric Light & Power Company, St. Louis, spoke upon the desirability of broadening the security offerings placed before the public, the possibilities of preferred-stock absorption having in many companies been utilized up to the desirable ratio to other classes of securities. These addresses are abstracted at length elsewhere in this issue.

to warrant their being made obligatory by law or code; methods of standardizing interpretation of doubtful points in the code, and study of the general wiring situation and its probable development when all or nearly all the buildings in a district are connected to central-station lines.

## Rate Research

The rate research committee reviewed a number of important rate decisions and rulings of the past year having to do with confiscatory rates, ordinance rates, special rates and relief granted by the United States courts. The necessity for cost analysis was again urged. Cost analysis will show whether any class of service did or did not earn last year its fair share of earnings. But it cannot take account of the interlocking and reaction upon one another of all existing classes of service. In brief, analysis should be a light on the road of business management; it should not supersede the intelligence which must guide our car along that highway.

The report discussed at length the decisions of the New Jersey, Wisconsin and California commissions that deal with the large question as to whether uniform rate schedules should be established throughout areas which are economic but not political units.

The committee said: "The trend of decisions and of practice continues to be toward reduction of the number of rate classes and the simplification of forms.

We do not foresee early uniformity in power factor clauses. The mechanical basis of credits and debits for power factor should be the metering by an integrating meter of the reactive component of the supply, and every power-factor clause should be designed to discourage bad power factor and encourage good power factor, and not to apportion meticulously the added costs due to a lower power factor of the electric system."

Attention is called to the recently published experience of the Hartford company,* with a residence rate composed of a fixed charge based upon floor area, plus a meter charge of 6 cents per kilowatt-hour, which composite rate was substituted in January, 1922, for a straight 10-cent-per-kilowatt-hour residence rate.

## Co-operation with Telephone Companies

R. F. Pack reported progress in the co-operative work being carried on with reference to inductive co-ordination and other matters in which the electric light and power companies and the telephone companies are interested. The two utility organizations, he said, are working in full harmony, endeavoring to find solutions to certain definite problems. The element of suspicion and distrust, Mr. Pack informed the convention, has entirely disappeared.

*See Electrical World, Feb. 17, 1923, page 412.

## Activities of Joint Committee

A review of the work and accomplishments of the Joint Committee for Business Development since its organization was made by E. W. Lloyd of Chicago. The speaker outlined some of the savings which could be effected by co-operative effort and closer organization and said the "electrify" movement to which the joint committee is committed is not a temporary campaign. He asked that the joint committee be supported by every electrical association and interest in both the United States and Canada, stating that the running expenses of the organization were not large. In the estimation of the speaker the joint committee is essentially a consulting organization and serves its purpose when it brings its members together to consider a given proposition, no matter from what source it originates.

## Lamp Standardization

The total sales of tungsten-filament incandescent lamps (excluding miniature lamps) in the United States during 1922 amounted, according to the lamp committee (W. W. Freeman chairman) to slightly over 200,000,000. This is a 25 per cent increase, over the 1921 sales of 160,000,000 and is within 1 per cent of the 202,000,000 sold in 1920.

The demand for lamps in the different voltage groups for the past three years is shown in Table I.

TABLE I—PER CENT DEMAND FOR LAMPS 1920-21

| Voltage Group | 1920 | 1921 | 1922 |
|---|---|---|---|
| 115 | 85.2 | 85.8 | 88.2 |
| 230 | 5.6 | 4.3 | 4.0 |
| Street series | 1.3 | 1.9 | 1.4 |
| Street railway | 3.2 | 2.6 | 2.0 |
| 30 and 60 | 3.9 | 4.7 | 3.5 |
| Miscellaneous | 0.8 | 0.7 | 0.9 |

Attention was again called to the recommendation that the use of 112-volt lamps should be discouraged.

The committee earnestly recommended that the question of complete standardization and unification be seriously considered by those companies which have not standardized as to voltage or unification of voltage of their systems.

## American Engineering Standards

The purpose, organization and method of functioning of the American Engineering Standards Committee was outlined by S. G. Rhodes, executive member of the light and power group of the main committee, who explains that the organization is limited to the functions of fostering, encouraging and providing facilities for standardization originated by other bodies. Its purpose is chiefly to certify to the adequacy of the method of preparation.

## Award of Prizes

Association prizes were awarded before the close of the convention as follows: The Charles A. Coffin medal to the Southern California Edison Company of Los Angeles, Cal., for excellence of station, distribution and transmission equipment, company organization and relationship with employees, public relations, and in recognition of its work in popularizing the use of electricity. This award was made at the meeting of the public policy committee and accepted on behalf of the company by John B. Miller, its president.

The Doherty gold medal for the best paper of the year was awarded to G. Bertram Regar of the Philadelphia Electric Company, the subject of his paper being "More Business Through Better Lighting." A. H. Heitzler and S. R. Finley of the Ohio Public Service Company of Massillon were awarded the Harriett Billings prize of $50 in gold, donated by Arthur Williams of New York, for their joint paper "An Analysis of Consumption by and Revenue from Domestic and Commercial Lighting Customers."

## Officers Elected

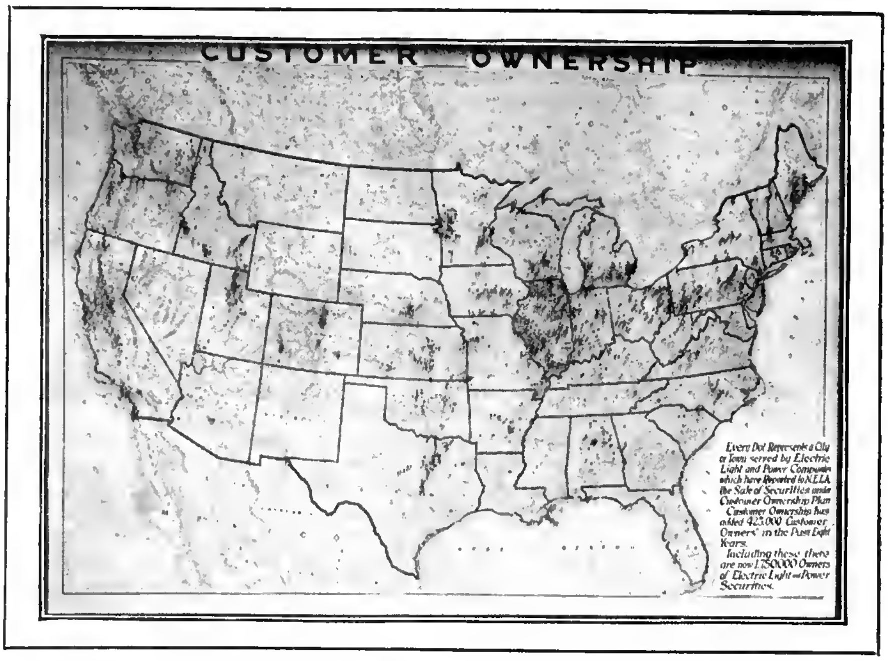
On the recommendation of the nominating committee, the following officers were elected: President, Walter H. Johnson, Philadelphia Electric Company; first vice-president, John A. Britton, Pacific Gas & Electric Company, San Francisco; second vice-president, J. E. Davidson, Nebraska Power Company of Omaha; third vice-president, R. F. Pack, Northern States Power Company of Minneapolis; fourth vice-president, H. T. Sands, Charles H. Tenney & Company of Boston; treasurer, Walter Neumuller, New York Edison Company. Of the five members of the executive committee whose terms of office expired, W. A. Layman, Wagner Electric Manufacturing Company, St. Louis; E. W. Lloyd, Commonwealth Edison Company, Chicago; J. E. Strong, Tucker Electric Company, New York, and W. E. Robertson, Robertson-Cataract Electric Company, Buffalo, were re-elected to succeed themselves for a term of three years, and Harry Reid, Interstate Public Service Company, Indianapolis, was elected to succeed J. F. Owens, Oklahoma Gas & Electric Company. The other members of the executive committee, who continue in office, are: I. E. Moultrop, Edison Electric Illuminating Company of Boston; H. C. Abell, Electric Bond & Share Company, New York; E. W. Rice, General Electric Company, Schenectady; P. S. Arkwright, Georgia Railway & Power Company, Atlanta; E. M. Herr, Westinghouse Electric & Manufacturing Company, East Pittsburgh, and T. A. Kenney, Hodenpyl, Hardy & Company, also elected.

Election of members to the exhibition committee of the Class D manufacturers resulted as follows: E. R. Whitney, Commercial Truck Company, was elected for a term of two years; J. C. McQuiston, Westinghouse Electric & Manufacturing Company, Pittsburgh, for three years, and George A. Hughes, Edison Appliance Company, Chicago, for three years. N. C. Garland, Ohio Brass Company, New York office, was also elected.

# Public Relations Sessions

***Greater Executive Attention to Customer Contacts Evident—Utility Commissioners Help Public and Utilities to Understand Each Other***

THE public relations section showed its virility by the program of its three sessions—one reporting the work of its committees, one devoted to a discussion of utility information bureau work, and one at which was presented a wonderful symposium by commissioners and utility executives.



## Committee Accomplishments Discussed

Taking as his text "We shall know each other better when the mists have blown away," H. T. Sands, chairman of the Public Relations Section, declared that this thought might well be taken as the motto and purpose of all public utilities in their public relations work. The continued success of the central-station industry will, he said, be determined by the extent that a company is able to gain and hold the confidence of the public which it serves. Between the industry and that confidence all mists of distrust and suspicion have one common origin—the lack of understanding of the public utility business.

What the public utilities must strive for is a better understanding between themselves and the public—an understanding on the part of the public of the industry and its problems, and, what is equally important, an understanding on the part of the industry of the mental attitude of the public toward it. The first prerequisite step toward securing this better understanding must be taken within the utilities' own household. Many employees still hold ideas regarding the fundamentals of the public utility business that are just as vague, just as erroneous and sometimes just as ludicrous as those held by the majority of the public. The first step, therefore, is for the utility to put its own house in order. To do this the executives must take their employees completely into their confidence, inform them as to the important fundamentals of their particular company, tell them frankly of its capitalization, its franchises, the contribution it makes to the community in the form of taxes paid, the size of the investment and how the money is obtained.

### Employee Relations with the Public

The committee on employee relations with the public (L. B. Herrington, chairman) drafted a proposed employees' manual which in its preliminary form embraces several commendable features.

### Co-operation with Educational Institutions

The development of closer co-operation with educational institutions in presenting the problems of public utilities to students has progressed satisfactorily under this year's committee, of which John C. Parker is chairman.

H. T. Sands
Chairman

Much attention has been given to determining how the needed public utility information could best be included in college courses.

With no attempt to influence or control, the association could well undertake to endow two or three professorships which would be intended primarily to facilitate research and secondarily to provide for the teaching of a series of public utility courses. Such a department would require an endowment of \$20,000 to \$30,000 a year. It was the belief of the committee that when the time is ripe for such an endowment the central-station industry could well afford the expenditure.

In view of the delicate character of the problem referred to the committee, it did not believe that any direct results could be produced in a hurry. None the less, the committee was persuaded that there is a very real opportunity to serve American education and incidentally strongly to benefit our industry. To this end the committee recommended that the following steps be taken:

(1) Compile a list of the schools at present giving public utility courses.

(2) Invite into conference with this committee a representative group of professors to determine whether our program will be acceptable.

(3) Communicate through a letter of inquiry to the school men, the country over, determining the acceptability of the proposed program.

(4) Prepare a general problem list for periodical dissemination to the schools.

(5) In special instances attempt to relate professors of economics with neighboring central-station institutions as source material for research.

(6) Discuss with the school men and formulate definite plans for a graduate group in public utility economics.

### Manufacturers' Advertising

Manufacturers of electrical apparatus and equipment have again had a part in the association program of building

through publicity better public relations for central-station companies. In the reports of the manufacturers' advertising committee (P. L. Thomson, chairman), the willingness of various manufacturers to use a part of their space in publications to talk about central-station problems was commended. The committee expressed its appreciation of the efforts of appliance manufacturers to co-operate with the committee and indicated that more of this kind of advertising may be expected in the future. There has been a growing disposition among central stations to recognize that the other branches of the industry which perform an economic function in the distribution of merchandise are entitled to fair play and an opportunity to reasonable return. This has resulted in a healthier point of view on the part of manufacturers toward the operating companies and their prosperity.

A number of security houses have co-operated with public utilities by running advertisements recommending this class of securities for investment. In connection with individual offerings of issues, much has been said in advertisements in favor of utility stocks and bonds, and their wide popularity has been widely recognized by financial writers in the editorial pages of both magazines and newspapers.

### Public Speaking

Back of the organization of the public speaking committee (A. C. Marshall chairman) is the theory that public utilities can no longer safely maintain an attitude of secrecy and mystery regarding the industry, and telling the story of utilities certainly is one of the best ways of informing the public and keeping it informed. During the past year a great deal of work along this line has been done through the public utility information bureaus and also by individual companies themselves. Among those which have done especially effective work are the Rocky Mountain Section public speaking committee, the New York Public Utility Information Committee, the Edison Electric Illuminating Company of Boston and the Michigan Committee on Public Committee Information; besides these a vast amount of work has been done in California under the leadership of S. M. Kennedy.

An important development during the past year was a series of lectures given by Carl D. Jackson, former president of the National Association of Railway and Utilities Commissioners. At educational institutions he spoke on general economic problems and brought the utility industry into his talk in a most interesting way. He also addresed bankers, editors, state and city officials and presidents and members of faculties of several educational institutions. This was thought by the committee to be the largest thing done this year.

### Information Bureau Organization

Public utility information bureaus have been organized in twenty-two states, their activities covering in all thirty states according to the report of the organization committee (H. C. Abell chairman). Bureaus are now functioning in the following states: Illinois, Indiana, Kentucky, Iowa, Ohio, Nebraska, Missouri, Oklahoma, New York, Kansas, Wisconsin, Michigan, Georgia, New England, Maine, New Hampshire, Vermont, Massachusetts, Alabama, Louisiana, Mississippi, Rhode Island, Connecticut, Colorado, Wyoming, New Mexico, Tennessee, Texas, Washington and Pennsylvania.

Organization of bureaus in four additional states is now under way, and work is in progress in other states.

### Relations With Financial Institutions

During the past year the committee on relations with financial institutions (M. S. Sloan chairman) has been working almost entirely on an effort to draft a law which can be introduced into the Legislature of the State of New York legalizing investment by savings banks in the securities of electric power and light utilities and also of gas and telephone utilities. The draft of the law has finally been completed and is ready to submit when it is deemed advisable.

In the consideration of this bill more or less discussion developed in connection with other types of utilities, particularly the electric street railway companies. It was found that, in view of the unfortunate condition existing in in the past few years from which the street railways are now emerging, the opinion of the savings-banks representatives was that they were not convinced of the advisability of including the electric street railways in this bill.

### Women's Public Information

The work of the women's public information committee (Miss O. A. Bursiel, chairman) was handled most effectively by dividing the work geographically. Efforts of this committee have been directed to promoting the plan of informing women within the industry about the public utility business as a whole and their own company in particular. A great deal was accomplished by talks given by heads of departments and by means of inspection trips over the properties of the various companies.

In some instances the activities of the women's committee have been carried into universities and women's clubs. However, while the committee believed that its educational activities might be carried into a wider sphere, taking in women outside of the industry, there remains much to be done in the education and information of those now within the industry. It was recommended that future organizations should not undertake to formulate new lines of instruction so much as to utilize what has already been developed and worked out through experience.

After the presentation of the various committee reports, L. D. Gibbs outlined the work of the Edison Electric Illuminating Company of Boston during the past year in showing a moving picture entitled "Edison Service," which had been accompanied each time by a lecture given by one of the company employees. In all, more than two-hundred thousand people in the company's territory have seen the film. The session closed with a presentation of the film as an illustration of what the central station can do to present its story to the public.

#### Election of Officers

Chairman H. T. Sands and Vice-chairman Frank R. Coates, W. H. McGrath and Edwin A. Barrows were unanimously re-elected to serve in their respective offices for another year, together with Martin J. Insull (ex officio), S. M. Kennedy, M. J. Sloan and E. C. Kifer, members-at-large.

## Information Bureaus Win High Praise

**Notable Addresses and Symposium of State Public Utility Information Committee Officials Are Features of Overheated Session**

IN SPITE of the extreme humidity and great heat, there was a large gathering on Tuesday afternoon to discuss the work of the state public utility information committees. The program included several addresses and a symposium in which officials of many of the state committees described the individual features of their work. Enthusiastic indorsement was given to this service, which now embraces thirty states, and the influence for good which it is exerting throughout the country. In opening the meeting H. T. Sands, chairman of the Public Relations Section, recalled the fact that when the first public utility information bureaus were organized newspapers were inclined to look upon the activity with suspicion. The frank, honest and constructive manner of the committees, however, has gradually won the confidence of the press.

H. C. Abell took the chair and spoke of the necessity of making clear to the people the financial needs of a public utility corporation. The work cannot be left entirely to the committee. The utility executive must study his own company and its place in the community he serves and must continue independently to work for better public relations at home. He must also give generous assistance to his state information committee for the common good, if much is to be accomplished.

The fundamental reason why it is necessary to make this effort to inform the public of the function and purposes of the public utility was discussed at length by Don Seitz, editor of the New York *World*. The misunderstanding between the public utilities and the public, he said, dates back to an inherent characteristic of the people, an unwillingness to be influenced to the

acceptance of benefits which they do not actively desire. The central station itself was born of a desire on the part of pioneers to develop an idea of which the public was not yet conscious. Overcapitalization became a feature of early utility operation, and the industry passed through an era of consolidation and reorganization which the general public neither understood nor approved. Thanks to the great resources of the country and to the unconquerable souls of the pioneers, in spite of all these handicaps the industry has achieved its present greatness.

In years gone by, Mr. Seitz continued, men were accustomed to say, "More power to your elbow." "More power at your elbow" should be the slogan of the electrical industry. The service which the public utility offers has become a matter of such constant convenience that the public fails to appreciate how comprehensive it is. The utility therefore must preach this doctrine of universal service.

Bruce Barton, president Barton, Durstine & Osborne, stressed the need for continuous, consistent, unflagging activity along the lines of education. "Scattered throughout this country as we talk here," he said, "there are several thousand old men lying sick, and before this meeting breaks up they will have died. During this same period there will be thousands of boys and girls born into the world. The utilities of this country have invested years of effort in the education of these old men, but it must be appreciated that this investment dies with them. The same story must be told in turn to the coming generation throughout all time. The work of informing the public, the upbuilding and maintaining of an intelligent public appreciation, is never done. The story of public relations is never completely told. It must continue so that each new child will grow up in the same well-founded background of information, that he may become a more understanding customer. Emerson said, 'What you are thunders so loud that I cannot hear what you say.' It is up to every company to endeavor to develop public relations by informing the public as to its deeds and its needs. There are three good rules to follow in public information work—be genuine, be simple, be brief. Talk in the language people understand and consistently continue in the work. No one can advertise in good times and expect to live on the memory of it when hard times come."

W. W. Freeman, Cincinnati, delivered an address written by Robert Lindsay, president of the Cleveland Electric Illuminating Company, as Mr. Lindsay was unable to be present. The public information bureau, said Mr. Lindsay, is the only mechanism available for representing all four utility elements. In the final analysis of things the public holds the fate of the utility industry in its hands, but only through mutual co-operation is it possible to develop the highest type of service at the lowest rate. This co-operation can be effected only when the methods and purposes of the utilities are interpreted to the public and understood. Much misunderstanding can be overcome by simplicity of rates and regulation. Information bureaus, however, cannot accomplish this by merely stating that the service is good and that the rates are low; it must be demonstrated also by the acts of the utility, and the commission that gets only funds and no active support from its members will not go very far.

There are now at least thirty bureaus of information. Each offers a valuable approach to the public and has proved of great influence. The future of the work lies in the hands of the central-station executives, and in Mr. Lindsay's opinion the development of the public information service would shape the development of the industry.

George E. Lewis, director of the Rocky Committee, told of the work his committee has done in developing contact and co-operation with colleges and universities. Sixty lectures in all had been delivered by this committee. The entire committee met periodically with the faculty from each of the institutions in that section, and the entire evening was spent in a general discussion of methods of presentation and the attitude of the students.

Joseph B. Groce, director of the New England bureau, said that the national scope of the work is an important consideration. Many evidences have been seen that matter from the New England bulletins has been published in newspapers of the West, and much information sifts in from other sections to the New England press. Educational influence on the editors of newspapers themselves is shown more in what they don't say than what they do say and is bringing a steadily increasing understanding of utility background.

John F. Gilchrist, chairman of the Illinois committee, announced that a public utility course has been established in the Illinois University. Much good has been accomplished by the work of the speakers' bureau, and in all approximately three hundred speeches have been made. This committee recently sent out a questionnaire to bankers asking what utilities can do to establish themselves in the confidence of the people. Ninety per cent of the answers said that good service was important above all else. Another canvass was made through the clipping bureaus to show what class of article is most acceptable to the newspapers. The committee had expected that the lighter articles and short items would be most useful to the editors, but found that the greater number preferred the longer articles, technical descriptions of properties and more detailed discussions. When the work through the schools was first organized the committee was somewhat fearful that the public would resent this activity and hold it to be selfish propaganda in the interests of the utility corporations. The teachers in the schools proved extremely receptive, however, and are co-operating heartily in the work.

Earle W. Hodges, director of the Arkansas committee, described the unique publication which this bureau is issuing. It is a sixteen-page booklet "boosting" Arkansas and is very generously supported. This monthly bulletin is distributed to sixteen thousand readers in the state—editors, ministers, teachers, clubs, farmers, business men and so on. A special appeal is made to the clergy. Mr. Hodges considers the ministers, the editors and the schoolteachers the most important elements in the public audience and is obtaining active co-operation from them by frankly interpreting the work that public utilities are doing.

# Commissioners Talk Frankly to Executives

## Public Attitude Toward Commissions, Depends on Utility Attitude Toward the Public

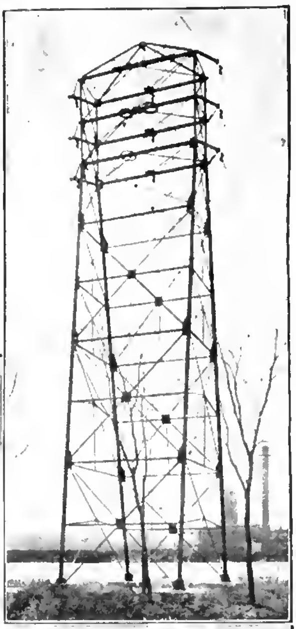
THE third public relations session was notable for the symposium on public relations by five leading public service commissioners and five leading utility executives.

A large audience, including most of the executives at the convention, attended the session. Closer attention to the detail of individual customer contact, advertising and publicity backed by 100 per cent efficiency in service, introduction of the subject of utility regulation as one of the elements of courses in civil government in the grade and high schools of the country, intelligent publicity of decisions, organization of the public relations departments of utilities on the basis of the organization of engineering and financial departments—all of these were suggestions discussed.

Chairman Sands pointed out that the Public Relations Section had started its career on uncharted seas, seeking advice and comments from those able to help, and that at this session men who were qualified from their positions to have a particular viewpoint of the situation were to talk.

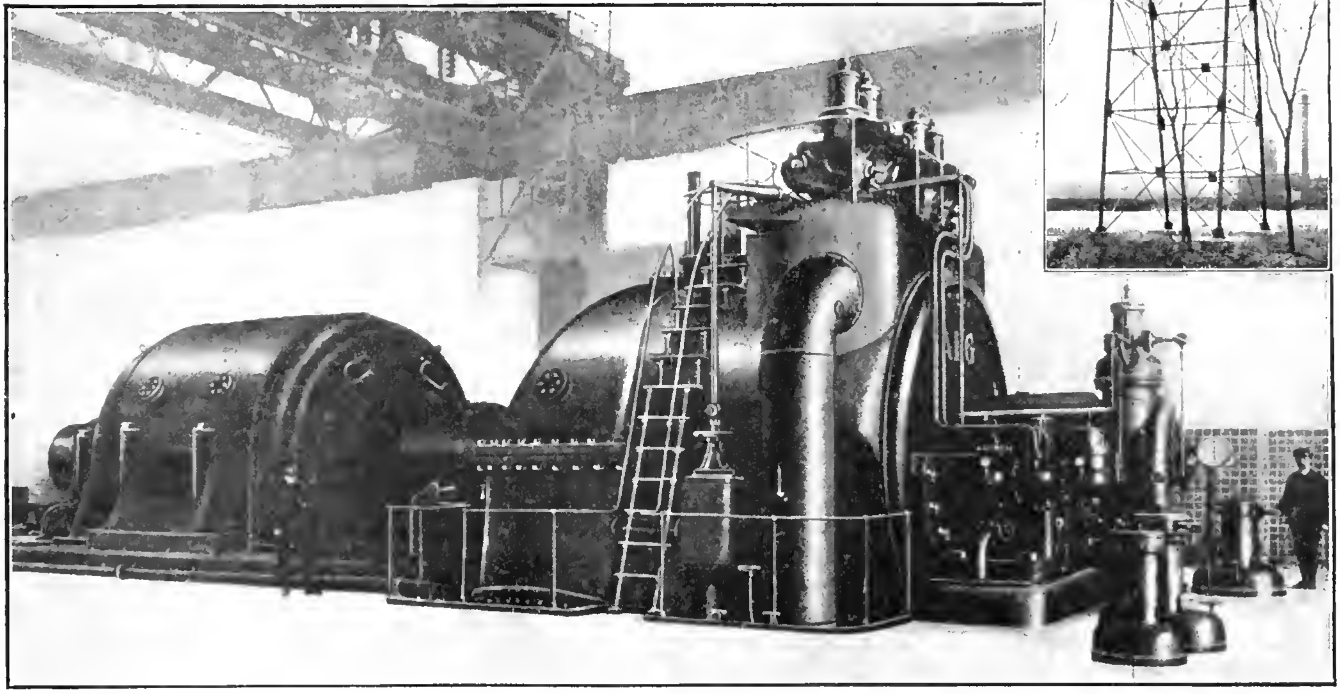
Executive Manager M. H. Aylesworth, in some introductory remarks, said that utilities used to think that service without talk was sufficient; later some thought that talk unsupported by service would accomplish satisfactory public relations; but both have been proved wrong, for both service and adequate publicity are necessary.

The individual addresses of commissioners and utility men are abstracted as a symposium which appears elsewhere in this issue.



# Technical Sessions

*Engineers Recognize Interlocking Responsibilities in the Solution of the Industry's Problems*



THE best indication of the interest-sustaining value of the technical reports of the N. E. L. A. this year is the fact that delegates to the convention crowded one of the great ballrooms of the Commodore Hotel each session and remained throughout, despite personal discomfort due to excessive heat and humidity. The discussions were so full of meat that to characterize the technical program as a whole in a short introduction would compel the omission of reference to many subjects which deserve the consideration of every engineer. However, attention must be called to some of the "high points," such as the discussions on higher pressures, steam reheating, stage bleeding and pulverized coal, increased need of attention to obsolescence, hydraulic penstock practices, experiences with automatic operation and definition of circuit-breaker duty, substations of the future, emergency connection between non-allied companies, bulk supply to industries, standardization of overhead construction, improvements in underground cable, the plan for a national superpower scheme and progress in inductive co-ordination.

As a group of specialists, each committee presented an excellent report, but all recognized that the greatest value comes from showing the relation of important developments and practices to the industry as a whole. To serve this purpose the Technical Section inaugurated this year the practice of having authorities contribute to a symposium on some of the major subjects of interest. The symposium discussions are particularly interesting as showing some up-to-the-minute individual opinions on the matters considered.

The symposiums, as well as abstracts and discussions of all the technical reports, are printed in this section, with the exception of the reports of the committees on prime movers and electrical apparatus, which have been treated more at length, beginning on pages 1353 and 1363. The subjects are classified according to the session at which they were presented. These sessions considered respectively related subjects on generation, conversion, outside plant and utilization.

## Mechanical and Electrical Innovations

### Higher Pressures, Reheating of Steam, Powdered Fuel, Useful Life of Turbines, Diesel Engines, Water-Turbine Developments and Automatic Substations Are Discussed

MORE than four hundred engineers attended the opening session of the Technical Section Monday afternoon, at which the prime movers, hydraulic power, and electrical apparatus committees reported. The general discussion was preceded by addresses by engineers prominent in the industry, such as Charles H. Merz, Frederick N. Bushnell, A. G. Christie, Peter Junkersfeld and H. Birchard Taylor. The prime movers report, which is printed in considerable detail elsewhere in this issue, was presented in two sections. Emphasis was placed on recent innovations, such as higher pressures, reheating of steam, stage bleeding, useful life of turbines and internal-combustion engines.

The electrical apparatus committee report, also digested rather fully elsewhere, featured experience with automatic substations.

In opening the first technical session Monday afternoon, Chairman R. F. Schuchardt called attention to the excellent work which the various committees, as specialists, have accomplished during the year and presented as printed reports. Rather than make the convention merely the scene for a glori-

fied presentation of the reports, he pointed out, the section had this year attempted to show the relation of certain outstanding practices, tendencies and innovations to the industry as a whole by having authorities on the subjects participate in a symposium.

## Hydraulic Power

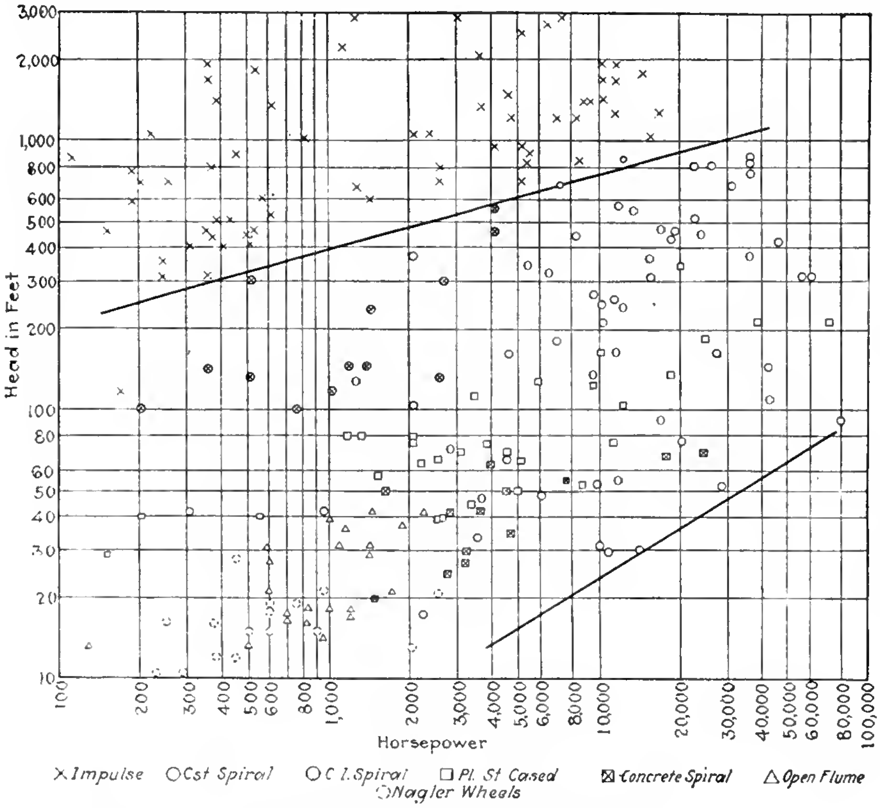
An account of the practice of various companies in the design of penstocks constituted the major portion of the hydraulic power committee's report this year. O. G. Thurlow is chairman. The subject was discussed in considerable detail, attention being devoted to the economic size, head used in determining thickness, factor of safety, minimum thickness of steel, buried as opposed to exposed pipe, coefficient of friction, air vents, expansion joints, anchor rings, anchors, piers, concrete riveted, welded and wood-stave pipe, painting, test and inspection, and specifications for steel and riveting. In addition, some space was devoted to the discussion of comparative tests on experimental draft tubes, the velocity method of measuring water flow, methods of forecasting water supply, effect of ice on water flow, and the proposed National Hydraulic Laboratory.

In general, air valves are installed on summits or at abrupt changes of grade where there is a possibility of the water column separating on a suddenly accelerating gradient, or where the hydraulic grade lines closely approach the level of the pipe line. The use of welded pipe for important penstocks is rapidly increasing. For this purpose welded pipe is practically limited to that made by a forge-welding process. Autogenous welding is not considered reliable enough for this class of work.

Reference was made to elaborate tests on twelve different types of draft tubes to determine their relative merits. Tests were made to show the effect of varying the threat openings and bell diameters, installation of supporting piers in the draft-tube bell, cones of various heights, flat plates, effect of extending horizontal diffusers down stream, effect of increasing the height of the vertical barrel, effect of enlarging the lower part of the vertical barrel, effect of decreasing areas in quarter turns to direct better the line of flow, turbine without draft tube, and other combinations. The performance of the higher efficiency tubes is almost identical. Two types of draft tubes were installed at the Mitchell Dam of the Alabama Power Company as a result of the tests shown.

Remarkable consistency of results has been noted in using the salt-velocity method for measuring water flow.

Comments from various companies on methods of forecasting water supply and observations made by several companies regarding the effect of ice on the flow of rivers were also reported. Statements of manufacturers on developments in the hydraulic field during 1922 conclude the report.



ENTIRE FIELD OF HYDRAULIC TURBINES, ILLUSTRATING PRACTICALLY ALL OF THE NOTEWORTHY PLANTS EVER BUILT

The outlying plotter points represent world records either in respect to size, extremes of head, either high or low, capacities, etc. The points above the top line represent impulse units, practically all of them being of the tangential type. The lower line represents approximately the limit of reaction units either in size or capacity for moderate and low heads, this limit being fixed by cost, shipping dimensions or generator speed. A shaded portion largely below but adjacent to the top line represents a field lying between the tangential impulse and the high-head reaction field, which is at present developed disadvantageously with these two types. It represents the field to which the proposed type of cross flow wheel is particularly adapted. Impulse wheel horsepowers are plotted for one jet.

## Adoption of Innovations Demands Reconsideration of All Factors

Charles H. Merz, consulting engineer, London, England, and member of the firm of Merz & McClellan, which designed the North Tees station in England, addressed the Technical Section Monday afternoon on the conditions which led up to the design of that station and the results of experience in its operation. This station was constructed in 1917 and embodied many of the innovations which have been adopted in this country recently, such as high pressure, air preheaters, stage bleeding and interstage heating. The adoption of so many innovations, Mr. Merz pointed out, demands that all factors entering into plant design be reconsidered seriously. Heat that can be taken back to the boilers instead of to the condensers should be transported there to secure the greatest economy. Since stage bleeding furnished all the heat necessary for raising the temperature of feed water, it was impossible to use economizers. Hence to save the heat in the flue gases air preheaters were employed to deliver air under the chain-grate stokers. Strange to say, Mr. Merz declared, no trouble has been experienced with this practice. The air preheaters have given less trouble than economizers and are cheaper to construct and maintain. No trouble has been experienced with stage bleeding, but the last heater next to the boiler had to be designed for boiler pressure, namely, 500 lb. Employing interstage heating has involved no problem except taking the steam back to the boiler and there superheating it to operate a 100-lb. pressure turbine. Some trouble has been experienced with the high-pressure cylinders of the prime movers, but this was due to the use of materials which would not have been employed at any time except during the war.

Commenting on the American tendency in driving auxiliaries, Mr. Merz declared that he did not believe it advisable to use house turbo-generators with high pressures. What is the necessity of striving for the last fraction of a per cent in economy in prime movers, Mr. Merz asked if the house turbines are used which offset the saving? If auxiliaries cannot be operated reliably by electricity derived from the station busbars, they can be driven from direct-connected auxiliary generators. The only place for the house turbine, Mr. Merz contended, is where an internal-combustion engine having an economy equal to the prime mover can be employed to drive it. This is one service where the internal combustion engine may possibly be used in large stations to advantage, he declared.

## Sets Goal of One Kilowatt-Hour per Pound of Coal

Development in the art of steam-power production has progressed far enough to make it entirely feasible to attain a goal of one kilowatt-hour per pound of coal in the near future, according to Fred N. Bushnell, Stone & Webster, who made an address on "Higher Steam Pressures and Improvement in Station Economy." One means of attaining this mark is through the use of much higher steam pressures. Materials and methods available at the present time will permit the use of two or three times the customary steam pressures, but higher temperatures must await development in metallurgy. The obvious method of preventing too early saturation is to restore the temperature of the steam by passing it through a reheater at an intermediate point in its expansion.

Already there are a variety of arrangements for utilizing higher pressure in conjunction with the reheating cycle. There is the single turbine arranged for extraction and return of the reheated steam, the tandem arrangement with high-pressure and low-pressure turbines driving the same generator, and the cross-compound arrangement of two or more distinct units which may be either adjacent or widely separated. Problems of design seem to demand that the pressure for the single reheating unit be limited to 500 lb. or 600 lb. For higher pressures one or the other two arrangements is probably to be preferred. The efficiency of the cycle demands that the reheating be accomplished with the lowest possible loss of pressure; this has an important bearing upon the arrangement selected. Control of the temperature of the reheated steam must likewise be carefully provided, especially where a varying load is to be carried.

In one arrangement promising reasonable flexibility as well as the highest efficiency a relatively small and simple high-pressure turbine will, for each individual boiler, reduce the pressure of the steam from 1,200 lb. to 375 lb. and deliver it through a reheater, in the same boiler setting, to a main header supplying turbines of the present standard type.

Already steam pressures up to 1,200 lb. have been definitely planned for commercial installation. For an experimental plant in England a critical pressure of 3,200 lb. will be adopted. Mr. Bushnell expresses confidence in the soundness of seeking greater economy through the use of higher pressures. Boiler and turbine builders, he explained, do not question their ability to produce reliable equipment for generating and utilizing steam up to at least 1,200 lb.

In order to be economically warranted, however, any station improvement must show an operating saving greater than the increase in carrying charges. The total cost of a high-pressure station, Mr. Bushnell announces, promises to be comparable with that of a station of equal generating capacity using the lower pressures now considered standard. The anticipated saving in operation should therefore be practically a net saving.

Retiring Chairman

H. P. LIVERSIDGE
Incoming Chairman

## Obsolescence Demands More Attention than Ever

On account of the almost unprecedented adoption of new practices in the central-station field, some of which are almost radical in the absence of extensive experimental data, and the fact that the use factor of equipment now being adopted is indefinite, there is more necessity than ever of giving serious consideration to obsolescence in determining the economies of new innovations, asserted Peter Junkersfeld in an address before the Technical Section. Furthermore, the prospective capacity factor or usefulness of the unit must be carefully estimated. Mr. Junkersfeld made the following observations:

According to an analysis of eight companies having 113 turbines with a total rating of 2,250,000 kw., nine turbines one year old had a generating-capacity factor of 45.2 per cent, twenty-one turbines two years old had a factor of 50 per cent, eighteen turbines three years old had a factor of 49.5 per cent, seven turbines six years old had a factor of 39.5 per cent, and sixteen turbines ten years old had a factor of 25.6 per cent.

In general savings and loss balance must be established. The balance should include operating and maintenance labor, supplies and adequate fixed return on investment. Coal savings will vary with the cost of coal being used and the yearly load factor at which the equipment is operated each year during its life. In determining the savings the life assumed should be the same as the life used in determining fixed charges on the loss side of the balance.

The fuel savings must obviously be placed on a kilowatt-hour basis. To have a true balance the extra fixed charges should also be placed on a similar kilowatt-hour basis.

## A Frank Appraisal of Powdered Fuel Presented

Prof. A. G. Christie, Johns Hopkins University, made a very frank appraisal of powdered fuel in an address before the Technical Section Monday afternoon. In general, he said that while powdered fuel has many points in its favor, there is a great danger in the extensive adoption of an underdeveloped practice by enthusiasts. The decision on whether to use powdered fuel depends entirely upon each individual installation.

Among the advantages cited for powdered fuel were the following: With this system low-grade fuel may be burned economically which could not be so burned in stokers. Furthermore, it permits of change from one type of fuel to another with very few modifications. Changes in load are easy to handle and standby losses are small as the coal supply can be shut off when the load drops. On account of the ability to minimize the excess air supply, it is possible to obtain higher efficiency, 80 per cent and greater efficiencies being possible of attainment above and below 200 per cent rating. Besides, the carbon losses are much lower than in stoker-fired boilers.

On the other hand, powdered-coal burning requires a higher grade furnace attendant than stokers. Very careful control of coal and air supply is also essential. Power requirements for pulverizing and transporting fuels are relatively large and there are still opportunities for improvements in pulverizing equipment. While water screens can be used to remove ash from powdered-fuel installations, it is very difficult to remove floating material in chimneys. In fact, removal of ashes may cost more than the removal of clinkers in stoker-fired plants.

Before there is a general adoption of powdered fuel, there is a great necessity to have power station records to analyze. Furthermore, there is an opportunity for considerable improvement in equipment. None the less, Prof. Christie commended manufacturers for the great strides they have made so far.

## American and European Hydraulic Turbine Practice

"There is no question that so far as mere magnitude of individual installations and number of installations are concerned American engineers have been pre-eminent" in hydraulic turbine practice, declared H. Birchard Taylor, of the William Cramp & Sons Ship and Engine Building Company, in his address. However, the advancement of the art may more justly be based upon the development of the creative ideas which have been produced.

"On this basis," Mr. Taylor continued, "the art of turbine design has reached a higher state of evolution in America

than in Europe. In this country the practice has been firmly established of putting every new development to the test. Since turbine construction is not a mere matter of furnishing material and labor, expenditures for experimental work are essential to the ultimate success of the industry."

The almost general adoption of vertical-type waterwheels and high-speed propeller-type runners and the development of the draft tube were cited by Mr. Taylor as three outstanding achievements of American engineers. "According to Holyoke tests on a diagonal propeller-type turbine having a specific speed of 680 or 153 (foot-pound system) an efficiency of 88.7 per cent was obtained, the turbine being equipped with the spreading type of draft of tube. The same turbine with a runner of somewhat lower specific speed, namely 497 (metric) or 112 (foot-pound), gave an efficiency of 90.7 per cent. In the still higher specific speed field an efficiency of 85.5 was obtained at 800 specific speed (metric)."

Commenting on some fallacious impressions which prevail regarding waterwheels, Mr. Taylor said: "Any type of reaction turbine — Francis, propeller or other type—obeys the laws of hydraulic similarity, namely, that their powers vary as the three-halves power of the head if the speed is allowed to vary as the square root of the head, provided that the turbine is located correctly with respect to tailwater. In the case of any type of reaction turbine which is placed too high with respect to the tailwater so that the continuity of flow through the turbine as a whole or in part is destroyed, the power will not vary in accordance with the above laws.

### Auxiliary Drives and Higher Temperatures Arouse Comment

In the selection of auxiliary drives, declared R. A. Hentz, Philadelphia Electric Company, reliability of operation is of the utmost importance. In attaining this requirement continuity of energy supply and control are important. After an interruption of service the equipment must return to normal operation. This is easy with induction motors, but may not be so with synchronous motors, he said.

In reply to this comment, F. C. Hanker, Westinghouse Electric & Manufacturing Company, contended that there are some places where synchronous motors are very satisfactory, and, besides, the psychological effect on consumers is desirable as a means of improving power factor. There are designs on the market which have a starting torque equal to the full-load torque. The speaker also referred to the use of a house generator driven by a simple turbine which normally floats on a line but drives the generator in an emergency. However, he warned that engineers must be careful not to adopt any equipment which will jeopardize reliability.

V. T. Malcolm, Springfield, Mass., referred to stability tests of metals at high pressures and high temperatures, saying that several oil refineries have pipe lines operating at 600 lb. and 900 deg. F. and even 1,200 lb. and 1,000 deg. Results of exhaustive tests at 1,000 deg. were cited in which an elastic limit of 21,000 lb. was obtained and a tensile strength of 52,000 lb. with 53 per cent reduction in cross-section and 29 per cent in elongation. At 800 deg. F. the characteristics of steel changes rapidly.

The stress due to high temperature is usually the one which is not sufficiently taken into account, declared Peter Junggren, General Electric Company. Expansion which takes place at high temperatures requires refinements not considered heretofore. Furthermore, most valves are designed incorrectly and produce unnecessary losses, which must be avoided at higher pressures and temperatures. They must be designed for freedom of expansion. Manufacturers expect no trouble in designing turbines for 1,200 lb. to 1,500 lb. pressure, he asserted.

Straight single-cylinder turbines have been adopted as standard for 600 lb. pressure by the Westinghouse Electric & Manufacturing Company, declared Frank Hodgkinson of that company. For higher pressure low-pressure elements will be compounded with such units. While reheating adds to the efficiency of operation at high pressure, it can be dispensed with if the turbines are designed for disposing of moisture and for bleeding steam for feed-water heating. However, this involves a problem of control to bypass reheaters, thereby injecting complications which might be undesirable.

# National Superpower Network Proposed

## Place of High-Voltage Cable in Such a System—Forty-four Standards for Overhead Construction—Analysis of Cable Failures —Motor Rules and Service Voltages

F. G. BAUM'S scheme for a national superpower network was the outstanding feature of the third technical session. The place which high-voltage cable will play in superpower schemes was touched on by W. S. Murray. In the reports of the overhead and underground systems the most important features were the overhead standards proposed and the analysis of cable failures. Sub-committee reports of the electrical apparatus committee (abstracted quite fully elsewhere) dealt with motor rules, transformer standards, radio and service voltages.

Mr. Baum's plan,* which is most ambitious in its scope, contemplates the establishment of 220,000-volt trunk lines between the major water-power and fuel-power centers of the United States and the most immediate markets for energy, including industries, mines and quarries and railroads. His proposal is based on four years' study of conditions as they are and of power requirements as he sees them in the immediate future as well as at a more distant time. Prior to presenting his plan, Mr. Baum outlined very generally but comprehensively the nature of studies which led up to his conclusion. These were explained by a series of graphs, charts and maps, giving results of surveys covering the following subjects: Existing systems and capacities, existing and prospective loads, diversity of customer, system and regional loads, as well as stream characteristics, distribution of fuel and water-power resources, etc. He arrived at the proper relation between steam and water-power plant capacities and pointed out that at the present rate of the growth of the industry the equivalent of one modern superpower plant will be required every thirty days. Attention was called to the fact that the Columbia River in the Northwest offers one of the most valuable sources of power in the whole United States.

*A more detailed account of this plan appeared in the Electrical World for June 2, 1923.

For the near future Mr. Baum believed that his plan was most feasible of execution in the Northeast; California, the Southeastern section of the United States, as well as the Middle West, have already started the nucleus of this superpower scheme. Later it may be possible to give the prairie states from Canada to the Gulf the benefits of power which they do not have now. Speculating on the future, he said that if power can be generated on the Columbia River for 0.3 cent per kilowatt-hour and 150,000-kw., 220,000-volt lines can be built for $40,000 per mile, energy could be delivered 600 miles from the generating point at about 0.8 cent per kilowatt-hour.

### Importance of High-Voltage Cable in Superpower Scheme

"The underground-cable structure is no less a part of a superpower scheme than the 110,000/220,000-volt overhead lines," declared W. S. Murray in an address before the Technical Section. "To realize the future rôle the high-voltage electric cables are to play one has but to look at the rapidly forming necessity of conducting large quantities of electric power beneath the earth's surface. Our overhead day within our cities and on the approaches to them is drawing to a rapid close. Henceforth what we shall need is not only 33,000-volt but 66,000-volt cables."

W. S. Murray expressed the firm belief that the policy of the public utilities is going to change rapidly and that eventually generating companies and distribution companies will be corporately distinct although possibly financially connected, as such separation will enable the distribution companies

to utilize money now spent for generation in extending the usefulness of electric service. He also referred to the important place which high-voltage cable will play in transmitting superpower into and within large cities, where the overhead line is fast becoming a thing of the past.

### Underground Systems

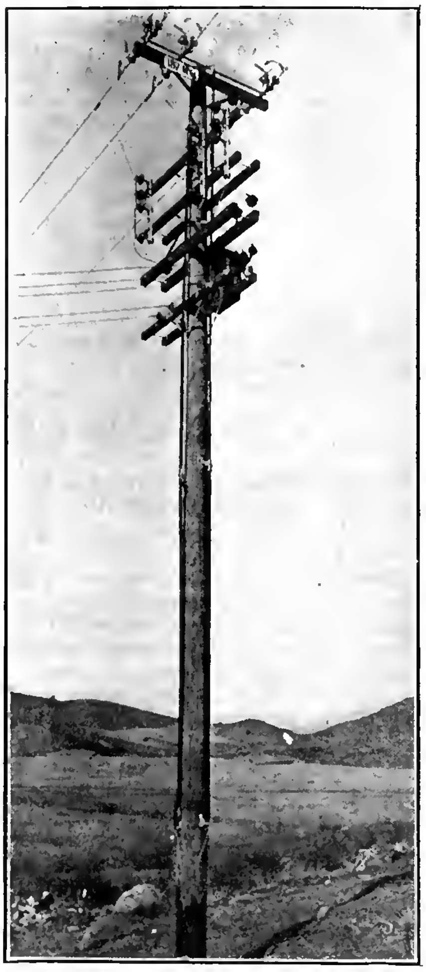
Two developments of great interest and importance to the central-station industry were apparent in the report of the underground systems committee, G. G. Post, chairman. First improvement in the quality of paper-insulated, lead-covered cables has made it possible to reduce the thickness of insulation without reducing the factor of safety of operation; second, the use of the kenotron for testing high-voltage cables with direct current promises to result in the ability to detect incipient failures of cables so that weak spots may be removed and the troubles due to cable failures largely eliminated. The insulation now used with Edison system cables ranges from $\frac{4}{64}$ in. on the smaller sizes to $\frac{6}{64}$ in. on the larger, such as 2,000,000 circ.mil. Cable rated at 12 kv., which in 1920 had insulation of approximately $\frac{13}{64}$ in. plus $\frac{6}{64}$ in., which since that time has been steadily reduced so that it now requires only $\frac{9}{64}$ in plus $\frac{4}{64}$ in., exceeds the voltage requirements in the breakdown tests on samples, with about the same margin of safety as formerly. Today the test requirements are easily exceeded. The recent factory breakdown tests between conductors have gone as high as 195 kv. and 174 kv. in the first and second tests respectively, without insulation failure, and up to about 115 kv. between conductor and sheath in both tests.

The power factor of the charging current at 80 deg. C. in the 12-kv. cable decreased from about 15 per cent to 3 per cent and recently has been as low as 1.4 per cent. The 33-kv. cable works at about 70 per cent higher dielectric stress and is more affected by the extra "ionization" loss. Its power factor at 80 deg. C. has dropped from values as high as 9 per cent in 1921 until now all manufacturers practically are furnishing cable under 4 per cent and as low as 2 per cent.

During the year 1922 one company was able by means of the kenotron almost to eliminate failures in service on a number of 6,600-volt rosin-oil cables. In making kenotron tests it is recommended by the committee that the direct-current voltage as determined by the voltmeter readings shall be two and four-tenths times the corresponding alternating-current voltage as given in the specifications.

During the past year one company has placed in successful operation about 30 miles of 350,000-circ.mil, three-conductor, 33-kv. cable, and it contemplates making further increases in this working potential on future lines. Another company is now installing some 500,000-circ.mil, three-conductor cable for operation on 44-kv., three-phase circuits. Several other companies are making investigations into the feasibility of securing single-conductor cable for operation on 66-kv., three-phase circuits. The chief limitation seems to be in the amount of ionization.

According to tests made on the Hochstadter-type cable, it seems reasonably clear that local charring due to tangential stresses between conductors does



SWITCHING AND TRANSFORMING EQUIPMENT FOR RURAL SERVICE

not take place to any marked degree in low-loss cables, although it probably is an important factor in high-loss cables. Hence the improvement in dielectric loss characteristic of recent cables makes this advantage of the Hochstadter-type cable of little value.

#### ANALYSIS OF CABLE AND JOINT FAILURES

Reports covering cable failures during 1922 were received from twenty-four companies operating cable systems which range from 6,600 volts to 33,000 volts, 13,000 volts being most extensively used. During the period covered there were 506 cable failures and 150 joint failures on systems aggregating 5,543 miles of cable. Hence the combined failures represent 11.8 failures per 100 miles of cable installed. The corresponding figure for 1921 was 14.1 and for the past five years it was 11.7. Considering the joint failures only, there were 2.7 per 100 miles, or 34 per cent lower than for 1921, despite a 16.5 per cent increase in cable mileage. During 1922 only 1.35 joints out of every 1,000 failed, while in 1921 there were 3.9 failures out of every 1,000 joints made. The majority of failures were attributed to factors external to the cable.

Classified according to voltage, there were 9.5 cable failures and 2.4 joint failures per 100 miles of cable operating at 6,600 volts and 15,000 volts, whereas with 20,000-volt to 33,000-volt systems there were 6.4 cable and 5.5 joint failures per 100 miles. The inference is that improvements in making joints, especially on the higher-voltage cables, has not kept pace with the improvements in the insulation of the cable itself.

There is a noticeable tendency toward the use of alternating current for underground distribution in large cities in connection with more recent installations. To secure the same continuity of service as in older direct-current systems, one company has started equipping its alternating-current substations with automatic selective protection. The distribution transformers on this system are connected in parallel on the secondary side with alternate transformers connected to different feeders on the primary side. At the point where transformers are connected to the secondary distributing mains a special automatic network switch is installed which operates to open the circuit on the reversal of energy flow equal to or greater than the core loss of the transformer. This switch also automatically recloses on resumption of normal voltage and power-flow conditions.

As a result of tests on heat radiation from conduits, it is now the practice of one company, where practicable, to install conduits not closer than 15 ft. apart and to limit the number of ducts installed to a maximum of eight, arranged two wide and four high, so that each conduit has at least one side adjacent to the surrounding earth. To minimize the temperature of its duct lines another company makes its ducts in the form of a U with a 4-in. drain pile located in the middle.

### Overhead Systems

Standardization and investigation of new and improved practices constituted the features of this year's report of the overhead systems committee (L. M. Klauber, chairman). Of the forty-four specifications for construction materials which were submitted and approved by the association as tentative standards last year, the committee this year presented thirty-eight for final approval. They covered guy clamps, clevises, side-groove and top-groove porcelain pin-type insulators, large and small porcelain spool insulators and side-groove, top-groove and service-glass-pin-type insulators.

Thus far the Western Red Cedar Association has refused to adopt the

proposed specifications for western red-cedar poles. This year the committee presented for tentative approval a new specification for chestnut poles. Several interesting modifications and innovations for timber preservation were submitted, and field practices of one company in pole inspection were described in detail. Some interesting notes were given on protection against termites, which continue to be great pests in the destruction of poles in some sections of the country.

Companies which use care in the selection of insulators based on climatic and physical conditions of the territory traversed will have few, if any, difficulties with the products now available in the market, the committee declared. There is still evident a tendency to charge insulators with failures which are in reality due to faulty pin design or utilization. Too rigid a type of conductor support is also to be avoided, as difficulties may be caused either by the breaking of the insulator top or by crystallization and ultimate failure of the conductor itself.

The sub-committee on insulator research continued its study on the effects of cyclic temperature changes on insulator life. A novel method of test to destruction, devised by A. Herz, was related.

A summary of some new and improved devices now available for line sectionalizing and protection was presented. Practices of several companies were related with reference to the position of transformers on poles and the sizes and weights which are hung on single poles. Attention was paid to labor-saving devices, automotive equipment, tools, etc., owing to the fact that companies are extensively adopting special mechanical equipment, such as pole-hole digging and pole-setting machines, air drills and concrete breakers, hoists and shaving machines.

A final report on the construction of the 220,000-volt lines in California was presented.

Two specifications for wood-pole transmission lines were included as indicating the practice of two large companies. The committee insisted, however, that it did not in any way wish to advocate their adoption as standards.

The use of high-voltage distribution lines is now on the increase. Not only is the rural and suburban field being covered by such circuits (as has been the practice for many years in the past), but thickly built-up districts as well.

Rural-line construction received considerable attention. Where such construction is utilized with due regard to local climatic conditions and the increased strength of structures which long-span construction involves a considerable reduction in first cost is often possible. Note was taken of the increased use of pole-type constant-current transformers and mast-arm construction for street lighting rather than span suspension.

**Differences of Opinion Expressed**

Certain recommendations and conclusions of the overhead, underground and electrical apparatus committees aroused adverse comment.

R. W. Atkinson disagreed with the conclusions of the underground systems committee regarding the value of the Hochstadter cable. He claimed that this cable shows its greatest advantages with improved types of insulation, since it is particularly intended to relieve the tangential stresses in the filler between conductors. He contended that the committee reached a different conclusion because tests were made with cables which apparently had old-type conductor insulation.

W. A. Del Mar urged caution in following the committee's recommendation of 2.4 times the alternating-current voltage value when direct current is used for cable testing. The factor should be more nearly 1.4, he claimed, where the impregnating compound is very fluid, as in new-type cables, or where the paper insulation is very loose, as in old cables. The speaker also questioned whether rise of power factor is necessarily an indication of air ionization. The opinion was expressed that the committee assumed too much in stating that air ionization is a serious limitation to cable operation at the higher voltages.

In discussing the reports of the sub-committee of the electrical apparatus committee on motor rules and service voltages (abstracted elsewhere), L. L. Elden, Boston, expressed extreme disappointment over the inclusion of increased starting currents and of running currents. Regarding three-phase as opposed to single-phase transformers, he said that the selection depends on individual circumstances, but appeared to favor the three-phase transformer. Temperature indicators were commended most highly as a means of reducing the investment in transformers, eliminating testing and increasing load factors. The comments were based on actual experience in Boston.

# 250/500-Volt Distribution Proposed

**Stone Believes Its Increased Capacity and Saving Warrant Study—Dow Outlines 4,600-Volt Distribution to Power Consumers—Torchio Suggests Principles of Interconnection**

THAT central-station engineers give serious attention to the use of three-wire, 250-500 volt distribution systems to replace the present nominal 110-220-volt practice was the recommendation of C. W. Stone, manager of the lighting department of the General Electric Company, in his address on "The Future Substation," in the symposium on substations, before the second technical session on Tuesday. Mr. Stone's address followed Mr. Tapscott's presentation of the substation and oil-circuit-breaker section of the electrical apparatus committee's reports, which appears elsewhere in this issue.

Mr. Stone said that, although developments had probably fixed a nominal voltage of 125 as a distribution practice, this service could be furnished efficiently and economically on alternating-current systems by the use of 250-125-volt auto-transformers and on direct-current systems by balancer sets. On a direct-current system serving 12,000 kw. per square mile and producing 46,000,000 kw.-hr. annually with sixty-four 1,000,000-circ.mil feeders, he said that approximately 560 tons of copper is required in feeders with 56 tons in the neutral and 140 tons in the network. Using a 250/500-volt, three-wire system, he said, 280 tons of copper could be saved. To supply 125-volt service sixty-four balancer sets of 100-amp. capacity would be needed at the feeder taps, costing approximately 10 per cent of the cost of the extra copper in the lower-voltage system. He was confident that the industry possesses the brains to make the 250/500-volt system work as it has in foreign countries and that the saving will make the effort worth while.

Indulging in what he characterized as dreaming on the subject of the vacuum tube and direct-current transmission, Mr. Stone said that all of the conversion operations from alternating current of varying voltages and frequencies to direct current and back again have been accomplished and that the elements of the necessary tubes are now in use. If the tubes are finally developed for practical service, he said that it means a revolution in high-voltage transmission practices. Existing lines could be used at three to four times present capacity.

The synchronous condenser would disappear from the substation, though it might become a necessary part of the generating station. The tubes required to transform from alternating current to direct current may be different from those for the reverse process, Mr. Stone said. For the low-voltage direct-current systems the substation might disappear and numerous feeding points from low-current tubes be substituted, since there is no present indication that tubes of ampere capacities running into the thousands will be developed.

L. L. Elden characterized C. W. Stone's advocacy of 250/500-volt distribution as a very disturbing suggestion now that operating companies have practically approached a standard, saying that the change-over would be almost prohibitive from an expense viewpoint. Furthermore, he declared that it is questionable whether the loss in distribution systems is as much as Mr. Stone cited, since 80 to 85 per cent of the input to substations is metered at the customers' premises. However, he advocated careful consideration of Mr. Stone's suggestions.

Alex Dow, president of the Detroit Edison Company, outlined the method of furnishing service to large power consumers from the 4,600-volt system in Detroit. This system has during a twelve-months period furnished an average of 210 consumers with 43,000,000 kw.-hr. in a single month and with 442,000,000 kw.-hr. for the year. A low limit of 100 kw. capacity for service from these circuits has been established because experience has shown that consumers using less capacity than this do not employ help capable of handling the higher voltages safely. Customers own their transformers and other service equipment except meters. A similar service is furnished from the direct-current system with a minimum of 300 kw. capacity, which is soon to be lowered to 200 kw. The higher limit is due to the greater cost of the cable and other equipment for the service under the Hopkinson form of rate used for both alternating-current and direct-current service.

Mr. Dow said that radial feeders with plain overload relays are used on the 4,600-volt system and loop feeders with balanced relays on the direct-current system. The 4,600-volt system is "plus" regulated only and therefore is not commendable from the standpoint of general service, and the responsibility for regulation is a burden of the consumer. In handling the 4,600-volt system, Mr. Dow said, the problem of contacts with trees is the most serious difficulty, and the 2,200-volt service still existing in some sections of the city can only be changed over as the standard of construction is raised and the difficulty mentioned is overcome.

### EMERGENCY CONNECTIONS BETWEEN NON-ALLIED COMPANIES

Philip Torchio gave as the first principle of emergency connections between non-allied companies the utilization of all existing facilities to insure continuity of power supply to the public, economies in investment and operation and saving of coal. The second principle is that the fixed and operating charges of the tie lines should be equitably divided among the contracting parties in proportion to the benefits derived. The third and last principle is that no company should derive a profit at the expense of another company, but only from the investment and operating savings due to the interconnection. Mr. Torchio cited a number of contact provisions which are designed to carry these three principles into effect.

## Safety Rules

Chairman Sproule in submitting the final report of the safety rules committee and recommending that it be disbanded, as its work has been accomplished, recommended that each technical committee be instructed to appoint a subcommittee on safety rules and that all safety codes be cleared through the engineering staff at N. E. L. A. headquarters, which will refer such codes to the committee concerned, with the understanding that a sub-committee will review the work and refer it back to the engineering staff with such suggestions for revision as are thought necessary. Mr. Sproule reported the organization of the sectional committee for revision of the National Electrical Safety Code under the American Engineering Standards Committee procedure which is composed of representatives from about twenty-five national associations. An executive committee of seven representatives from the insurance interests, employees, steam railroads, electric railway, utility commissions, municipal inspection interests, electric light and power and telegraph and telephone interests has been formed and sub-committees to consider the relative hazards of circuits in different situations, clearances, strength of materials and underground construction have been organized to carry on the work of revising the safety code.

## Meter Committee

The section on maintenance of relays prepared by the Metropolitan Section of the N. E. L. A. for the relay handbook was a feature of this year's report of the meter committee, with W. L. Wadsworth as chairman. Action on standardization of meter instrument design, a compilation of public utility commission rules on frequency of meter tests, company practice on limitation of two-wire meters and the regular résumé of manufacturers' developments concluded the report.

In addition to presenting various forms of records used in relay maintenance work, the report covered acceptance, installation and periodic tests, equipment in making tests, typical procedure for testing various types of relays and usual troubles with relay maintenance.

The committee has for several years encouraged technical universities and colleges to conduct short courses for metermen of their localities. Where the suggestion has been followed much good has been done.

Efforts have been made to eliminate certain special requirements specified by users of meters and instruments, but little progress has been made. The committee urged manufacturers of meter cabinets and wiring devices to provide such devices as will accommodate the meters with which they will be installed.

It was the committee's opinion that no change in register ratios and constants should be allowed. Neither should any terminal change that will not meet the specifications of the Association of Edison Illuminating Companies be allowed. To convert top-connected meters to bottom-connected meters it was recommended that the necessary parts be obtained from the meter manufacturer rather than by using some auxiliary wiring device. It was reported that manufacturers are of the opinion that the present rotating standards are not subject to temperature errors which cannot be compensated for by proper use.

In the redesign of existing types of instrument transformers a majority of the manufacturers have complied with the recommendations of the committee relative to the standardization of dimensions, polarity and polarity marking. Testing of such transformers on customers' premises has been a problem which is now solved to a considerable extent by the introduction of Silsbee current and voltage transformer test sets. The manufacturer's statement as to accuracy is fully justified, the committee reported.

Synchronous timing motors are being used generally, although the new type is gradually displacing the old. According to a questionnaire the 10-amp., 110-volt, two-wire meters are being used in preference to 5-amp., 220-volt, three-wire meters.

### METERMAN EDUCATION

Prof. Frank D. Paine, professor of electrical engineering, Iowa State College, in the symposium on metering, defined a properly qualified meterman as one who understands the fundamentals of electricity, the meter and how it functions and the fundamentals of meter design, who can think and take an interest in his work, who understands the relations of metering to demand and rates, and above all the relationship between the public and the utility he works for. Men selected for meter work should be capable of education to fill these specifications, and Professor Paine said that the utility companies must move first by raising the standard and pay for the work. To carry out better education of metermen he suggested more trade school courses of one or two years of which meter work shall be the primary part. He said that from twelve to fifteen hundred electrical engineers are being graduated this spring, of whom only a small number are entering the utility field, and that an opportunity is offered to bring many of these men into meter work, using this occupation as a stepping stone to a better position in the utility organization. In conclusion, Professor Paine outlined the work on five short meter courses held in the past five years at Iowa State College.

Frank G. Vaughn, sales manager meter department, General Electric Company, urged the same care in equipping and maintaining meter departments that is exercised in other departments of the business.

### LIVERSIDGE NEW TECHNICAL SECTION CHAIRMAN

Officers of the Technical Section for the administrative year from July 1, 1923, to June 30, 1924, were elected at the Tuesday afternoon session. They are: Chairman, H. P. Liversidge, Philadelphia Electric Company; first vice-chairman, L. M. Klauber, San Diego Consolidated Gas & Electric Company; second vice-chairman, C. F. Hirshfeld, Detroit Edison Company; third vice-chairman, W. K. Vanderpoel, Public Service Electric Company, Newark, N. J.

# Inductive Co-ordination in Good Shape

## K. L. Wilkinson and H. B. Gear Review Year's Progress—Hypothetical Cases of Co-ordination Are Discussed and Questions Answered

CALLING the attention of the fourth technical session on Thursday afternoon to the main principles involved in the work on inductive co-ordination, K. L. Wilkinson, engineer for foreign wire relations of the American Telephone & Telegraph Company, summed up the year's progress by saying that the status of the work is better today than it has ever been before. He attributed this result to the splendid support of the joint general committee by the N. E. L. A. member companies and the Associated Bell Companies. He further said that the previous estimates of the large growth and development of both the supply and signal utilities are being realized, if not exceeded, and the future work on co-ordination will require the most careful and intelligent study to insure that the public shall receive satisfactory and efficient service of both kinds. His conclusion was that the progress during the past year has shown that the fullest co-operation and interchange of information and data between representatives of the two utilities form the basis for successful co-ordination. It has also proved the desirability and necessity for the continuation and extension of this work.

H. B. Gear of the Commonwealth Edison Company, speaking on the same subject contrasted the present status with that of two or three years ago and characterized the progress by citing the recognition that has taken place that three parties are equally interested, the public, the power companies and the signal companies. He also brought out the recognition of inductive influence, inductive susceptibility and coupling as factors in the problem as an evidence of the progress made. Mr. Gear reviewed the progress of the geographic division inductive co-ordination committees and expressed the opinion that the difficult problems experienced in the early days of the national committee work in keeping in touch with field conditions and in spreading the information developed through its work are being solved by the division organizations and their work.

### Inductive Co-ordination

Establishment of co-operative procedure between the Bell Telephone System and the N. E. L. A. was one of the chief accomplishments of the year, according to the inductive co-ordination committee (R. N. Conwell, chairman). It resulted in the adoption on Dec. 9, 1922, of joint "principles and practices," which were given in full in the report this year. Continued organization and expansion of the activities of the geographic division and local committees on inductive co-ordination were other prominent results of the year's work. These committees practically constitute a field force or staff for service to member companies and have rendered most valuable assistance in carrying the "principles and practices" to member companies and also in collecting important field data and surveys for the national committee and headquarters staff.

Owing to the lack of exact technical data and insufficient knowledge of inductive phenomena, it was necessary to limit the "principles and practices" very largely to qualitative statements and provisions, which will be supplemented in the future by more exact detailed practices as the knowledge of the art is progressively advanced by the joint development and research program now organized by the Bell companies and the N. E. L. A.

In its broader aspects the national work on this problem is emerging from its exploration or pioneer period and entering its constructive stage. The future program recommended by the committee embraces continuation of the general study of the physical, economic and legal aspects of the problem; continuation of the educational and co-operative work with member companies, through the division and state committees and headquarters staff; co-operation with the joint committee on development and research, and general continuance of the division committee activities in making field surveys and tests and assisting member companies.

The committee urged particularly that executives, officials and engineers of electric service companies read this report in full because it contains material which can be made of immediate permanent value in procuring satisfactory handling of current problems of inductive co-ordination through co-operative procedure between the local interests directly concerned. The report contains detailed preferred practices, so that a basic code is now available for guidance in the co-operative settlement of specific cases. Difficulties which may arise in applying the "principles and practices," owing to unusually severe local conditions or to meeting inductive phenomena not as yet subject to full control or mitigation, or from any other cause, can be made to serve a very useful purpose in guiding the course of the research work.

### Hypothetical Cases Solved

As the final part of the program two hypothetical cases in inductive co-ordination were presented. The first, discussed by J. G. Hemstreet, superintendent of operation, Consumers' Power Company, Jackson, Mich., was that of the building of a power line between two points. Two routes were available, one being direct and resulting in a cost to the telephone company of three or four thousand dollars for retransposing, and the other route, which was a longer one, resulting in a cost of $30,000 to the power company. Either route involved difficulties to one or the other utility. The correspondence involved in initiating the line construction and the memoranda on the conferences between the power and telephone companies were read, and typical questions that might arise in such cases were asked by power men and answered by the representatives of the Bell and allied telephone companies present. It is assumed that all solutions would be reached under the principles and rules already adopted by the general joint committee representing the National Electric Light Association and the Bell companies.

The second problem, presented by O. H. Bundy, Central Hudson Gas & Electric Company, Poughkeepsie, N. Y., involved a hypothetical case where a telephone company was experiencing inductive troubles and desired in addition to make extensions of its circuits. This discussion was given in the same way, the hypothetical correspondence and conference memoranda being presented and questions asked and answered by power and telephone men.

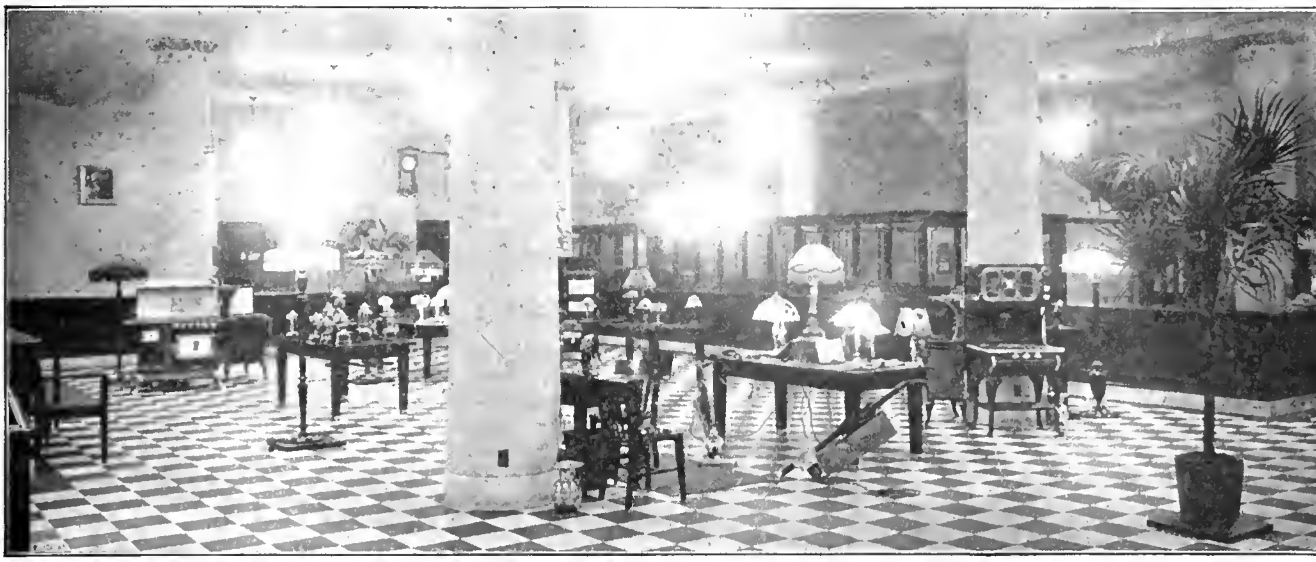
### Experiences Related

Elmer T. Sperry in a few words outlined the inductive troubles between the early telephone and electric light companies that resulted in the meeting in 1885 at which the National Electric Light Association was formed. This meeting was held at the old Grand Pacific Hotel, Chicago, and it was expected only a few men would attend. About 140 were present.

Prof. C. F. Scott outlined the change that has taken place in the attitude of the telephone and light and power companies toward each other. This attitude has changed from one of mutual suspicion to one of mutual confidence. As a result a joint discussion of problems like the one taking place as he spoke, in which both telephone and power men could participate with the greatest freedom, had become possible.

A. P. Way, American Railways Company, Philadelphia, indicated that it had been difficult to reach common ground in inductive co-ordination matters partly because the expense involved has been allowed to influence decisions and said that both parties can hope for a solution of the problem only when a straight open view is taken and selfish interest is not allowed to enter.

R. F. Pack of the joint general committee paid a graceful compliment to the inductive co-ordination workers, giving the credit for accomplishment to the engineers of both utilities. H. P. Charlesworth, speaking for Bancroft Gherardi of the American Telephone & Telegraph Company, expressed Mr. Gherardi's regret at his inability to be present because of business out of town, and said that the work had passed beyond the formative stage, in which suspicion was present, and had got to the fact-finding stage. He said further that unless the facts were ascertained it would be impossible to get far.



# Commercial Sessions

***Four Commercial Bureaus Present Unusually Substantial Reports—Movement Started to Expand Function of Commercial Section***

FIVE things stand out as of particular importance in the story of the Commercial Section sessions. Four of these are: (1) Enthusiastic indorsement was given the electric truck, and this indorsement was supported by the announcement of a national co-operative promotion campaign, for which a large appropriation has been raised. (2) An exceedingly informative and valuable report on residence lighting was produced and also an analysis and demonstration of store-lighting possibilities that should prove a distinct stimulus to this branch of the business, particularly as a practical advertising campaign has been made available for its support. (3) A very live session was devoted to the division reports of the Power Sales Bureau, in which an especial feature was made of the opportunities for the development of the industrial heating field, and the movement as well is to be supported by an organized national campaign of publicity and promotion adequately financed that will make this a notable achievement of the coming year's work. (4) A very careful study of the problem of compensating salesmen was an important feature of the merchandising session, but the discussion of the electric range possibilities overshadowed all else, and here again a project for national promotion has been organized and a campaign is to be conducted with a generous backing of money already pledged that promises a real awakening of interest and activity in range selling throughout the country.

But perhaps the most significant development in the entire course of the commercial program was the frank discussion on Thursday afternoon of the necessity for strengthening the Commercial Section itself by a determined effort to re-enlist the interest of the older commercial men of the industry and notably a considerable number of the ex-chairmen of the section. The hearty response which was expressed by the entire meeting on the announcement of the drafting of this "old guard" for duty was an indication that the need is now appreciated and the reform assured.

## Strong Indorsement for Electric Truck

**Commercial Men Discuss the Growing Opportunity for a Vehicle Load—San Francisco the Latest Convert to Its Desirability**

EVERY interested discussion of the electric truck, its record and its opportunity, marked the first session of the Commercial Section program. A warehouse man prodded the central-station industry on the lack of support through the more adequate servicing facilities which it might give. A battery manufacturer analyzed the market and appealed for a larger vision on the part of electrical men in considering what the truck can be made to mean to the industry. It was announced that the San Francisco central-station company has become the latest convert and is about to embark on an extensive development program.

The meeting opened with Oliver R. Hogue, chairman of the section, presiding. In his address he sketched briefly the work of the section during the past year and paid tribute to the conscientious, persistent work that has been done by the various bureaus and committees. A nominating committee was appointed consisting of E. W. Lloyd (chairman), Joseph E. Becker, T. I. Jones, C. J. Russell and R. R. Young. The meeting was then turned over to Charles R. Skinner, Jr., chairman of the Electric Truck and Car Bureau, who presented the bureau report to the session.

### Electric Truck and Car Bureau

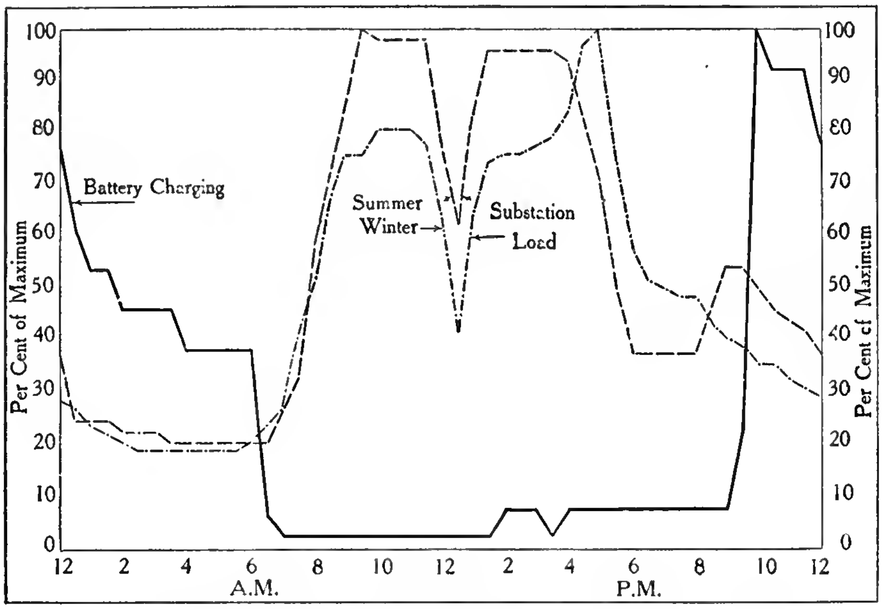
There has been a marked change in the method of selling trucks, he said. The former practice was for the manufacturer to endeavor to sell the central-station vehicles for its own use, and the central station was oftentimes permitted to apply them to unsuitable work. Today, however, the purpose is to secure the co-operation of the central station in the sale of trucks to local industries adapted to the electric vehicle. The Electric Truck and Car Bureau is actively supporting this work through the organization of two electric truck schools, one in New York and one in Chicago, to give instruction in the care, operation and maintenance of electric vehicles.

Central stations, appreciating the growth in electric truck transportation business, are following the lead of New York, Chicago, Boston, Hartford, New Orleans and Los Angeles in establishing departments equipped with the necessary expert talent to give advice on problems connected with electric truck transportation.

Public utility corporations have during the past twelve months purchased approximately two hundred electric trucks.

During the last two years over one thousand electric trucks were sold in the New York City section.

Through the Joint Committee for Business Development a tentative plan has been formulated for a more intensive all-year-around electric truck and car development program, which, however, was carried out supplementary to its report.



LOAD CHARACTERISTICS—ELECTRIC VEHICLE BATTERY CHARGING COMPARED WITH TOTAL SUBSTATION OUTPUT

Charles F. Morris, past-president of the National Furniture Warehouse Association, followed with his earnest appeal that the electric vehicle should have more helpful support from the electric light and power companies through the provision of adequate service facilities. Mr. Morris is connected with one of the large metropolitan warehouses and is operating electric vans exclusively. Eighty per cent of all the trucking done by the big city storage warehouses, he says, lies within the range of the electric vehicle, and the fact that electric vans can be stored in the warehouse and carry a lower insurance rate gives them great advantage over any other system of haulage.

There is just one element of dissatisfaction with the electric truck in Mr. Morris' opinion, and that is the fact that when the battery on an electric truck begins to run down the driver cannot find a convenient place to renew it. The chauffeur of a gas car can always purchase more gasoline within a block or two or obtain other assistance. For the electric truck, however, there are at present, even in the larger cities, but a scant number of service stations, and many of them are inadequately provided for and inexperienced. As a result they do not welcome the electric vehicle when it calls, and the service is given with an air of toleration. He closed with a spirited appeal to the central-station men present to provide this commodity on which the electric truck must depend for success.

In the general discussion which followed, W. L. Goodwin explained the program for promoting the electric truck which has recently been developed through the co-operation of the Society for Electrical Development and the Joint Committee for Business Development, for which the society has appropriated $25,000. William Van C. Brandt, Philadelphia, pronounced this program the greatest single step in the promotion of the vehicle industry. G. R. Freeman, Chicago, announced that the Commonwealth Edison Company has appointed a committee of executives to study the problem of what can be done to speed up the truck market. The central stations in New Orleans, Cleveland and San Francisco, he said, have all put on vehicle salesmen recently and are more actively taking up the development of the electric vehicle load.

The importance of centralized control of transportation equipment was stressed by John Stilwell, general superintendent of transportation, Consolidated Gas Company of New York, in a short address. Mr. Stilwell is in charge of the motor equipment of the New York utility companies.

## Supervision of Motor-Truck Equipment

Prior to 1902 he said the utilties of New York depended solely on horses for all trucking. Today the horse is practically eliminated and the work is being done by 757 motor vehicles. In short-haul city-delivery work the economy of the electric vehicle has been very pronounced. For instance, the transportation charges against one department in 1913 when it was horse-equipped amounted to $98,525.12. This department was completely equipped with electric trucks in the year 1917 and the total cost of cartage for the year was $55,403.53. This showing is the more remarkable when the increased business during these five years is taken into consideration. Any time or money spent on the selection of the proper type of vehicle, gasoline or electric, and the make and body specifications for the particular work to be done is amply repaid by the results obtained from using the vehicle best adapted for the particular service.

Another point which the speaker dwelt upon was the standardizing of equipment to the greatest possible degree, to have as few different types and makes of trucks as is consistent with the varied requirements of the service. Standardization of equipment greatly simplifies the repair-shop work, as a complete line of spare parts can be carried. Mechanics and repair men become accustomed to these particular trucks. It is also possible to transfer a truck from one department, which may be slack for the moment, to another department which is very busy.

An interesting story of the work of the electric vehicle school committee was told by Chairman E. S. Mansfield, Boston. As a result of a large number of inquiries from central stations as to how to start a vehicle department, it was decided to organize a vehicle school on the successful experience of the industrial heating school held some time ago. The vehicle manufacturers did most of the work and provided for all the costs, and to date they have spent over $10,000. Out of it, he says, have come the most useful data on transportation engineering that have ever been published. The first school was organized in New York on May 16 with about twenty-five attendants. A second school will be opened in Chicago on June 19, and at present there are applications from forty men. A third school is to be organized later in San Francisco. Ten men are already pledged, and twenty will probably be in attendance. As a result of this work, the subject of transportation engineering will be added to the N. E. L. A. educational courses hereafter.

## National Increase in Use of Electric Motor Trucks

In an address on the national increase in the use of electric trucks, William Van C. Brandt, Electric Storage Battery Company, Philadelphia, called for a bigger vision of the electric truck opportunity.

There are now in service 10,457 electric motor trucks, consuming on a most conservative estimate 60,000,000 kw.-hr. per year. There are in addition 10,192 electrical industrial trucks and 15,000 electric passenger cars operating, which will treble this consumption. There will be sold this year at least fifteen hundred additional trucks, which will mean that there will be required 9,000,000 additional kilowatt-hours next year for the trucks sold this year. This is a

conservative estimate of the immediate market which actually exists today.

Those who have studied the question, said Mr. Brandt, assert that 70 per cent of the city and suburban delivery service is short-haul, frequent-stop work well within the radius that can be handled to particular advantage by the electric truck. If this is a fact, then the total possibilities for the electric would be 70 per cent of all vehicles used in city and suburban delivery service.

The speaker did not believe it would be stretching the vision to an impossible degree to consider it possible to sell in this country one hundred thousand electric trucks within ten years. To the central stations this would mean the sale, on a conservative basis, of 600,000,000 kw.-hr. of off-peak energy per year. It would help considerably to flatten out the valley which now exists in the load curve and at the same time it would mean a revenue, at 4 cents per kilowatt-hour, of $24,000,000 per year. It would mean to the truck manufacturer $20,000,000 sales per year. To the storage-battery industry it would mean $15,000,000 per year additional revenue from the sale of the ten thousand trucks per year and as much again in renewal sales. To the manufacturers of electrical equipment, excluding batteries, it would mean $3,000,000 per year.

In answer to an inquiry, Mr. Ray of San Francisco announced that the Pacific Gas & Electric Company acknowledges itself the latest convert to the electric vehicle, and gives the credit to the Electric Truck and Car Bureau. As a result of a close study of the work of the bureau, this company has become entirely "sold" as to the value of the electric vehicle load. The executives have given almost unlimited authorization to go ahead and build up the electric truck on the Coast. Announcement could not yet be made, he said, of the details of the program, but the plan will be in operation by June 19.

## Electrically Equipped Furniture

The report of the electrically equipped furniture committee was presented by Ralph Neumuller.

Considerable strides have been made during the past year in the perfection of outlet fittings that simplify the electrical equipping of existing furniture.

The popularity of electrically equipped furniture depends largely upon the public interest that is aroused in it. The committee during the past year was able to secure a very large volume of publicity in furniture trade publications, in popular magazines, in select home-furnishing magazines and on woman's pages in the newspapers. It did not feel, however, that this was sufficient to create the necessary desire that will result in a more general adaptation of this innovation in American homes. What is needed is the interest and support of the entire industry. Manufacturers and central stations can assist materially by pictorially showing electrically equipped furniture instead of just ordinary furniture when the nature of their advertising requires furniture settings for appliances or other items.

O. R. HOGUE
Retiring Chairman

N. T. WILCOX
Chairman-Elect

If the thousands of men and women who are an integral part of our industry were each to equip electrically just one piece of their own furniture, the tea wagon or the dining-room table, for instance, it would afford publicity to hundreds of thousands of others. Central stations may lend a tremendous amount of support by sponsoring local campaigns for the wiring of just one piece of furniture by their customers.

In discussing the future of electrified furniture, J. F. Becker, New York, pointed out that wired furniture is of no use without convenience outlets, and that the work of this committee must have the backing of all the industry in the promotion of such outlets. Mr. Becker believed that if the central stations, manufacturers, contractors and other electrical interests could be induced to co-operate simultaneously in the promotion of convenience outlets a great advance could be made in the development of the use of electricity in the home. To this end he deplored any tendency to depart from the term "convenience outlet," because the combined strength of the industry is needed behind whatever name is used.

## Commercial Service and Relations with Customers

Harold Wright presented a report on Commercial Service and Relations with Customers. During the last two years this committee has given to the industry ideas, presented in the form of "Service Suggestions," which have been found of practical value to companies in which they originated. The following "Service Suggestions" were issued this year:

September, 1922—"Identification and Appearance of Meter Readers."

October, 1922—"Educating Employees in the Proper Use of Electrical Appliances."

November, 1922—"Plans for Reporting Complaints and Submitting Suggestions for Betterment of Service."

December, 1922—"The Business of Your Company Is to Render Service and Courtesy to the Public."

January, 1923—"Proper Location for Meters."

February, 1923—"Telephone Orders for 'Better Service.'"

March, 1923 — "Improving Service Rendered to Outlying Communities."

April 1, 1923—"The Practice of Disconnecting and Reconnecting Meters in the New York & Queens Electric Light & Power Company."

Since the results obtained are extremely gratifying and the expense involved is small, the committee recommended that this work be continued during the coming year. The committee felt it should have contact by representation with a similar committee of the American Gas Association and hopes that during the next year that feature can be added.

Very strong indorsement was given to the work of the committee on commercial service and relations to customers in the general discussion which followed presentation of the report.

G. E. Miller, Cleveland, urged that the succeeding committee continue sending out reports of this nature through the year in convenient form for use by the central stations. Cleveland has put into effect four of the suggestions which the committee has made this year.

C. E. Barton of Long Island City acknowledged his indebtedness to the committee for the suggestion to take care of the rush of service orders at moving time. He applied this suggestion on May 3. Under the system of his company orders for setting and removing meters passed through three departments, but to meet the emergency the entire operation was concentrated in one department, which greatly increased the capacity to handle them. Mr. Farwell, Chicago, said that one of the best ways to simplify routine is to diagram it. The drawing of a diagram immediately shows up indirect methods and duplication.

## Education

The session closed with the presentation of the report of the educational committee by Fred R. Jenkins, chairman.

During the past year the committee continued the publication and sale of the commercial engineering course and the course on practical electricity and offered for subscription three new courses on lighting sales, merchandise sales and power sales. It is anticipated that during the next year these new courses will be well established and in general use among central-station companies. Subscriptions to the commercial engineering course for the year ended March 1 were 189, an increase over the year previous. Subscriptions to the course in practical electricity for the year were 552. On the three new courses added subscriptions were received as follows: Lighting sales

course, 49; merchandise sales course, 112; power sales course, 82. All of the commercial courses have been self-supporting, and it is anticipated that with the support of the association and a suitable committee representation in each geographic section, the new courses will be maintained on a self-supporting basis.

Lloyd Prince and S. Bennett of New York and C. J. Liebman of Brooklyn reported benefits which they had experienced through the N. E. L. A. educational courses. In Brooklyn, in the case of a course on the organization and function of the sales department, more than 90 per cent of the sales department employees attended one or more lectures and 78 per cent were present at half or more of the lectures.

# Big Commercial Opportunities in Lighting

### Additional Loads and Attractive Revenues from Long-Hour, Large-Volume Business Await Central-Station Exploitation of Readily Accessible Field

The report of the Lighting Sales Bureau was issued in three parts, one devoted to residence lighting, one to store lighting and a third to six other specialized divisions. The residence lighting report, twenty-seven pages in length, which had already been published in the *N. E. L. A. Bulletin* and in *Electrical Merchandising*, presented a wealth of valuable data and constructive suggestions to aid in the development of better lighting for the customer and better business for the industry and was read by Dr. M. Luckiesh, chairman, of Cleveland.

## Residence Lighting

The first part dealt with commercial possibilities. It contained statistics showing the various conditions of lighting, types of fixtures, character of glassware, number and wattage of lamps and convenience outlets in the middle-class homes of the country covering several thousand cases. It compared these actualities with a "conservative ideal" home and showed that there exists a possible increase in revenue of $125,000,000 to the central stations in the present wired houses.

The second part contained a plan for properly lighting the home. The various rooms of the house were treated and the styles of fixtures for these rooms enumerated.

The third part of the report dealt with selling residence lighting. It pointed out that actual demonstrations of lighting are much more effective than any method of mere description, and then followed a compilation of methods, data and results of demonstration rooms, exhibits and electrical homes held throughout the country.

Per capita analyses of residence lighting revenue, declared R. D. Cutler, Hartford, Conn., in discussing Dr. Luckiesh's report, offer more enlightenment than per-customer data. From 1910 to 1922 the annual income per customer changed little, the respective figures being $24.90 and $23.90, while the per capita income increased from $0.90 to $4.58.

W. G. Blackwell, Newark, N. J., urged the use of model electric homes in stimulating residence lighting business. Six such homes are now on exhibition in New Jersey. The speaker pointed out that duplex outlets cost little more than single ones and should be generally installed. E. D. Tillson, Chicago, said that on the Commonwealth Edison system for every minute the use of lighting is extended in twenty-four hours the company's income increases $100,000. Closing, Dr. Luckiesh advocated the use of shades on fixtures in model electric homes, pointing out that the glare has been present in too many instances in the past.

## Store Lighting

The report of the store-lighting division was read by James Kirk, chairman, and presented a mass of valuable data in the nature of reports and illustrations, covering the possibilities of store lighting, including results of store-window and store-interior tests, publicity campaigns, interviews with merchants and a store-lighting booklet.

It characterized store lighting as the "untouched treasure chest," reporting on results gained in raising the "light level" in Chicago, classifying store "prospects," making definite recommendations for organizing a sales staff and suggesting successful ways to sell store lighting. Based on experience in Chicago, the committee estimated the possibilities for the complete development of store lighting in a city of that magnitude and of the respective sizes of Los Angeles, Duluth or Sharon, Pa., and told what this would mean, if applied uniformly throughout the United States, both in added profits to the merchant and in increased central-station load.

The sale of intensive store lighting, said George Miller, Cleveland, is one of the easiest jobs that the central-station commercial department encounters. One sales representative reported that not a customer called upon in four months in Cleveland had refused to listen to the message of improved illumination for stores. Up to June 1 the average intensity had been increased from 5 foot-candles to over 11 foot-candles. At high intensities the central station competes with daylight illumination.

## Goods Sold Direct from Illuminated Window

R. D. Cutler, Hartford, cited experience with a recently installed window in which the Hartford Electric Light Company lends space to local merchants for the most modern illumination of their goods. Although this is on a cross street at the side of the company's office, popular interest has led to frequent withdrawals of particular items of merchandise from the window for sale to persons passing by who have been transformed into purchasers by the attractiveness of the display. In this way local merchants get the benefit of the latest practice in colored and plain illumination for windows without undergoing the expense of having their own establishments changed over without knowing just how the layout will look before the expenditure is made.

G. H. Stickney, Harrison, N. J., urged that members actually get to work upon increasing window-lighting intensities in order to derive tangible benefits from such practice. C. A. Musson, United Electric Light & Power Company, New York, touched upon the recent formation of a "Rainbow Makers' Club" to show merchants the best practice in utilizing colored lighting for window displays, and offered to share its experience and knowledge with delegates applying for advice.

J. Daniels, Boston, described successful surveys of large Boston department stores for improved illumination, which have increased the company's income $600 to $2,000 per month according to the installation. This company is about to intensify its store-lighting field work, beginning with improved illumination installed in its district offices and extended to nearby representative stores, with intensive canvassing of the forty-two municipalities served. J. Campbell, Brooklyn, emphasized the part that specifications and drawings showing outlet locations may have in central-station co-operation with contractors. It was also brought out that in New York today 10 foot-candles is regarded as a comparatively low intensity for the clothing trade.

The report showed that the energy consumed in signs and displays is increasing each year and that the rapid development of this class of business promises to be exceptionally high in the next few years. A careful survey was made during the year, and an interesting report of these statistics was included.

The trend toward illuminating billboards was shown to be developing rapidly, and increased interest in adequate maintenance was evidenced. The central stations have not capitalized this valuable load to the extent that it warrants.

## Lighting of Large Buildings

The report of the division on lighting of large buildings brought out the important fact that central stations, realizing that approximately 60 per cent of their revenue is derived from lighting, are steadily adding men versed in illuminating engineering to their staffs to advise on lighting plans for new buildings and for the improvement of existing installations.

New building is continuing at a rapid

pace, and the new structures, together with many of the older buildings, are showing the results of the appreciation of higher standards of illumination. A report of additions to the bibliography of 1921 and 1922 was made, together with a table of recommended intensities of illumination.

The street and highway lighting division stated that street-lighting business has not always returned a fair interest on the investment and therefore has not been looked upon as an attractive load to the central station. There is no reason, however, why it should not undertake to sell better lighting on a business basis, for there is a public demand for better lighting from the standpoint of protection, safety and better business.

The year 1922 showed a decided improvement in street lighting, with exceedingly bright prospects for 1923. The report enumerated many improvements in lamps, standards, glassware and in various types of effective reflecting devices.

The report of the industrial lighting division was divided into several phases. The first covered a very thorough test, depicting the relationship of better lighting to output. The next pertained to portable lighting exhibits having for their purpose the education of the industrial public to the potentialities of good lighting. The next section dealt with lighting equipment and portrayed the importance of distribution. The following section covered the question of sales campaigns and helps, shown through the medium of pertinent charts. A bibliography of articles on industrial lighting appearing during the past year was appended.

The year was not noteworthy with regard to the development of equipment embracing any radical changes from existing types, according to the division on commercial aspects of lamp equipment. Many new pieces of accessories were developed, however. Attention was called to the advisability of luminaires being equipped with interchangeable attachment devices readily permitting the change of luminaires which would bring about the opportunity of increasing the service in lighting.

# Industrial Heating of Prime Importance

### Enormous Potential Load Awaits Development by Central Stations, but Executives Have Failed to Grasp Its Possibilities—W. S. Murray Outlines Superpower Outlook

POTENTIAL possibilities of industrial electric heating which indicate that this load will soon overshadow the motor load in the ratio of three to one monopolized the attention of the Power Sales Bureau at the third commercial session.

Attention of the Power Sales Bureau (C. K. Nichols chairman) during the last year was directed largely to the development of industrial heating, and a detailed report of accomplishments was given in the report of that division. The general power applications division (Ernest Pragst chairman) made no formal report at the convention, but devoted its efforts to the preparation of articles on power subjects for publication in the *N. E. L. A. Bulletin* and endeavored as far as possible to confine these articles to those industries where special requests were made for investigation.

The competitive power sources division (H. H. Holding chairman) started its work rather late in the year, and as the subject assigned to it is one requiring a very great amount of detailed study, no report could be made at this time. This division was instructed to study the comparative characteristics and costs of uniflow engines as well as the newer types of oil engines. Research engineers in different parts of the country are now carrying on these investigations, and as soon as they are completed the results will appear in the *N. E. L. A. Bulletin.*

W. A. Murray pointed out that the superpower system could not well be a company or a corporation as such a procedure might defeat its own purpose. He stated that super-utility would have been a better term and called attention to the fact that central stations have been practising its principles since they came into business. Mr. Murray traced the growth of the power business through four distinct steps: (1) Small companies first produced, transmitted and distributed small quantities of energy in their immediate territory only. (2) These small utilities then gathered themselves into groups and larger stations became necessary to supply the demand. (3) Expansion of these groups of utilities then followed, with further enlargement of power houses and the exchange of power between groups and stations. (4) Last came the present superpower plants and systems, with a very pronounced expansion of stations and interconnection. The present state of development stands for constantly increasing power plants and closer co-operation between companies.

## Industrial Heating

One of the chief activities of the industrial heating division (Wirt S. Scott chairman) was to compile a list of manufacturers and users of industrial heating apparatus, something that has never been available. This division also conducted the industrial heating school most successfully during the past year, and it plans to organize additional schools in the different geographic divisions.

It is felt that the development of industrial electric heating up to the present time has been more or less accomplished on the "hit-and-miss" basis and very little concentrated and co-operative effort put into it, except by individual central stations or electrical manufacturing companies.

It is the consensus of opinion of those who have had an opportunity of giving this matter any study at all that the industrial heating load eventually will greatly exceed the motor load; also that the revenue obtained from a kilowatt connected of industrial heating load will show an average of double the revenue received from a kilowatt connected of motor load.

Commenting on the work of the industrial heating division, Mr. Scott defined it as making two kilowatts grow where but one grew before and predicted that ten years hence this load will be at least ten times the lighting load. To show what this business means to the central stations of the country, he stated that there has been 1,200,000 kw. of industrial heating equipment sold during the past five years. On an average this load brings between $50 and $60 in annual revenue per kilowatt connected, thus adding, in the aggregate, approximately $40,000,000 per year. Within ten years this may be confidently expected to grow to $400,000,000. He declared, however, that, although the industrial heating load has grown thus rapidly, the idea has not as yet been thoroughly sold to the central-station executives.

To promote the business the Power Sales Bureau has worked out a program with the Joint Committee for Business Development, which, with the help of the Society for Electrical Development, will carry out an educational and publicity campaign through the daily papers and trade journals. Speaking for the society, William L. Goodwin stated that $25,000 had been appropriated and is now available for this purpose. He outlined the general methods by which the program would be carried out and expressed the pleasure of the society in being able to aid the Power Sales Bureau in its work.

### C. F. Hirshfeld Urges Growth in Heating Load

Failure of central-station executives to recognize and lend their whole-hearted support to building up the industrial heating load was reiterated by C. F. Hirshfeld. He warned against electrical men being too confident of the superiority of electric heating over fuel heating as the combustion men are constantly improving their apparatus so that in many respects it is now on a competitive basis. He urged central-station men to put forth as great an effort as possible at this time to obtain industrial heating business in order that it may become firmly established as an essential part of manufacturing operations.

Looking into the future development of electrical heating apparatus, Mr. Hirshfeld pointed out that much of the equipment was converted fuel apparatus rather than true industrial electric heat-

ing. Experimental developments indicate that some processes which are now being done in converted combustion equipment can be done by the direct application of electric current to the material to be treated. In addition to induction furnaces, nut and bolt heaters and the Northrup high-frequency furnace, which are true electrical applications, japanning and enameling operations may soon be done by an improved method.

J. C. Woodson pointed out that electric heating equipment is almost twenty-five years behind the development of other electrical apparatus. But this fact alone proves its merit, judging from the insistent demand for its use in industrial applications. He urged that, if the expected volume of this business is to be realized, attention must be concentrated upon the standardization of equipment wherever possible. Special applications should be discouraged.

Stephen Bennis, H. H. Russell, John H. Mitchell and V. M. F. Tallman paid high tribute to the work of the manufacturers in conducting the industrial heating schools and courses of instruction for central-station power representatives. At the suggestion of Mr. Tallman, a motion was passed unanimously by the Power Sales Bureau expressing its appreciation of the manufacturers' hearty co-operation. The session was closed by Chairman Nichols, who urged upon all those present the necessity of convincing central-station executives of the importance of creating in each company facilities for the proper and intelligent development of the industrial heating load.

### Frank W. Smith Prize Awarded

During the session the regular business was suspended while President Smith awarded the first Frank W. Smith prize of $100 to Cunard C. Nelson of the Edison Electric Illuminating Company of Boston.

# Salesmen's Compensation Feature of Merchandising Meeting

## Training of Salesmen and Testing of Appliances Discussed Before Large Gathering—Spirited Indorsement of Electric Range Opportunity

THE Merchandise Sales Bureau presented one of the most substantial reports ever delivered before any meeting of the commercial section in recent years. F. D. Pembleton was in the chair and in his introductory talk dwelt at length upon the importance of the appliance business to the modern central station. However, in spite of the fact that the subject has been very conspicuously before the industry for the past year or more, there still remain a great many executives who do not yet consider it one of their major problems. Many policies and many details still need to be worked out, but perhaps one of the most urgent needs is to thoroughly sell among central station men themselves the conviction that the central station has a big merchandising job to do.

In the absence of E. A. Edkins, chairman of the education and training of sales people division, the report was presented by Henry Kobeck.

In the opinion of the committee, the industry today is suffering for want of more and better salesmen, and this need is accentuated by the rapidly changing conditions in retail selling. After the spectacular collapse of the "buyers' market" three years ago, when it became painfully apparent that the buying public were staying away from stores, there developed an unprecedented demand for salesmen. The supply, of course, was, and still is, inadequate. In the effort to meet this demand thousands of unfit men have been "hired and fired," and the turnover has been tremendous. It is obvious that these new conditions cannot be dealt with successfully, either by the employment of inferior men or by attempting to recruit sales forces from those of other industries. The proper economic solution is to employ men who are at least reasonably well educated, personally presentable and mentally alert, and then train them in the industry's schools.

The committee was of opinion that the problem of developing good salesmen begins in the employment bureau. Too much money is spent in futile efforts to make salesmen out of the wrong kind of men. Not enough has been spent to get the right kind of men. Detailed recommendations on this point were offered.

The sales analysis division presented in its report a summary of some of the most successful sales campaigns that have ever been conducted in this country. The analysis sheets upon which the report is based are on file at national headquarters, where any one interested can study them. They embrace in detail experience in selling vacuum cleaners in Providence and Kansas City, washing-machine sales in Portland, Oregon; range campaigns in Raleigh, N. C.; Summit, N. J., and Vincennes, Ind.; toaster sales in Boulder, Col.; portable heater sales in Salem Mass., and selling general household appliances in Chicago.

### Standardizing and Testing

In presenting the report of the standardizing and testing division, R. S. Hale, chairman, announced that the purpose of his committee is not to establish standards, but rather to encourage tests that will develop testing processes and a higher standard of quality in appliances and accessories.

The standardizing and testing division had, through conferences with manufacturers and others, endeavored to establish proper methods of testing which may be used by any one for the purpose of determining the durability of an appliance, believing that when proper testing methods are universally adopted, or adopted by at least most of the manufacturers, member companies will be able to select appliances with much greater assurance that they will give satisfactory service, and manufacturers will find it much easier to sell appliances.

### Basis of Paying Salespeople

The report of the division of the basis of paying salespeople was one of the most instructive contributions on the commercial program and in the absence of Howard A. Lewis, chairman, was presented by Mr. Pembleton.

The committee interviewed a number of the biggest sales organizations in the country, secured their schedules of payment and methods of operation, and presented this information in a definite concrete form so that member companies might make a detailed study of the different systems employed and intelligently compile their own schedule of payment for their salesmen.

The committee report made an analysis of the favorable position of the central station in the community for undertaking the sale of household appliances, and a detailed study of the question of a drawing account and the conditions under which money should be advanced to salesmen. It also described the difference between the house-to-house selling of well-known and easily demonstrated appliances and the "negotiation soliciting" entailed in the introduction of appliances still in their pioneering period and considered the basis of compensation appropriate for both.

C. E. Greenwood, Boston, raised the point that central stations should be able to hire salesmen at a smaller commission than other merchandisers of electrical equipment, because in representing the central station the salesman has a preferred position with the public and gains the entree to the home more easily. This was corroborated by G. J. Liebman, Brooklyn, in describing a compaign to sell house wiring in Brooklyn last year. The Brooklyn Edison Company financed the contracts and made the collections. The contractors did the selling for a term of weeks. At the end of this period, when the central station advertising was discontinued and the contractors' salesmen were no longer able to introduce themselves as representatives of the lighting company campaign, they found it very much more difficult to sell house wiring.

The electric cooking and heating division reported that there are upward of seven thousand communities where a heating and cooking rate of 5 cents or less is available, which is about half of the total number of communities having a twenty-four-hour electric service. C. O. Dunten is chairman.

Of that portion of the population of the United States living within the zone of central-station service only about 25 per cent have a heating and cooking rate available. It is estimated that there are about 200,000 electric ranges in use at this time, an almost negligible fraction of the total business possible of being developed in communities where electrical service should logically be the chief dependence for cooking.

The chief activity of the committee was devoted to an effort to create an organization which would vigorously promote a more extensive range business. This was accomplished through the formation of a special joint committee composed of the cooking and heating divisions of the N. E. L. A. and representatives of manufacturers and distributors working in conjunction with the Society for Electrical Development. Arrangements were made with the society to carry out the program outlined by this joint committee working in close co-operation with the Joint Committee for Business Development.

The importance of adequate demonstrating in the sale of electric ranges was stressed by Don Ray, San Francisco. He said it is absolutely essential that a woman trained in domestic science call on the purchaser immediately and demonstrate the appliance, calling up to find out whether everything is doing satisfactorily. If this is done and the customer is satisfied at the end of sixty days, the range will never come out. The Pacific Gas & Electric Company has set a bogey of 2,500 ranges to be sold this year, and at the end of the first four months was ahead of the quota.

At present there are 5,436 ranges in service on the lines of the Idaho Power Company, and J. F. Orr, Boise, reported that the company is very much interested in developing tests on the lines to determine the diversity and demand factors of the electric range load. This work is being actively taken up by the Northwestern Geographic Section with the expectation that it will be possible to put on a man to give his entire time this year to making tests in different cities and under varying conditions.

Eastern central station men were urged by J. V. Strange, Portland, Ore., to put more effort immediately behind the electric range. The sales began on the Pacific Coast ten years ago, he said. Then the work dwindled until the point was reached where but a very small percentage of the houses remained unwired and the central stations of the Coast turned to the range as the next step in development. The same evolution will follow in other parts of the country inevitably, and it will be far easier and more profitable for the power companies to undertake the work now when it can be developed systematically and with deliberate planning, than to wait until public demand forces quick action. In Spokane, he said, there are at present 40,000 homes connected and 4,000 ranges in service. In one period of six weeks this year 429 ranges were sold in this city, and this business in itself raised the income per residence $1. No one need fear, therefore, that the rewards will be insufficient.

W. L. Goodwin congratulated the range division on the progress which has been made since the Denver meeting, when it was so enthusiastically decided that something should be done. In ten years of range selling, he said, approximately 200,000 ranges have been sold in the United States. It is not generally appreciated that 50 per cent of these ranges have been sold east of the Mississippi River. It is this lack of appreciation of how widely the electric range has been distributed over the country that is the greatest obstacle to progress. Men who believe in the electric range must undertake at once the job of converting the executives of the central station industry, so that they may be able to secure the permission, authority and financing necessary to such a market development.

### Lloyd Appeals for Support

A very moving appeal was made by E. W. Lloyd, preliminary to his report as chairman of the nominating committee, that better support be given by the central station industry to the N.E.L.A. commercial section. Executives are talking today of doubling the capacity of our central station system within the next five years. That means a tremendous job for the commercial men and will demand the very highest quality of leadership. Unfortunately, he said, the older men have drifted away from the commercial section, and for several years past the majority of the ex-chairmen of the commercial section have not been active at all in its affairs. This tendency has been in marked contrast with the technical section, where the older men continue active in the affairs of the section, serve on its committees and contribute freely to the discussion of the ever-changing problems.

Various elements of public relations and customer ownership, he said, are essentially commercial subjects, yet they have been relinquished and are today included in the programs of other sections. Mr. Lloyd announced that he had already made a recommendation to the executive committee that the commercial section be called into consultation in such details of the work of the public relations section as may be of importance to commercial men.

### Election of Officers

The following names were placed in nomination by the committee and unanimously elected to serve for the ensuing year: Chairman, N. T. Wilcox, Boston; vice-chairman, W. R. Putnam, Boise; vice-chairman, F. E. Pembleton, Newark; vice-chairman, George H. Jones, Chicago. For members of the executive committee, A. F. Berry, J. G. Tridle, A. K. Baylor, and to fill the unexpired term of Rawson Collier, W. E. Clement, New Orleans.

In congratulating Mr. Wilcox on his election Mr. Hogue recommended to the incoming administration that twelve members at large be appointed to the executive committee instead of six as in the past and that six of these members be ex-chairmen of the commercial section drafted for active work to the end that the commercial section may be strengthened and developed to a higher degree of responsibility and usefulness.

## Range Committee Meeting

**Facts of Successful Range Experience Must Be Interpreted to Executives to Get Action**

An extra session of the range committee was held on Friday afternoon to give further discussion to range experience and plans. W. L. Goodwin described in detail the promotion program which is to be organized behind electric range developments this year. F. D. Pembleton, Newark, N. J., dwelt upon the difficulty in overcoming the indifference of the central-station executive. There was a free discussion of the urgent need for searching out the facts of successful range experience and selling them to the central-station industry itself so that executives may become more understanding and enthusiastic as to the possibilities which lie ahead.

J. V. Strange, Portland, Ore., said that with all the Pacific Coast experience they cannot say how profitable the range business is, but they are endeavoring to find the answer, realizing that the greater the load is built up the more profitable it is bound to be. Don Ray, San Francisco, in answer to the question of whether ranges can be sold to combination companies in competition with the gas range, stated that the difficulty was generally overestimated. The Pacific Gas & Electric Company is selling electric and gas ranges at the same time. Their salesmen are competing for the business, though, of course, not disturbing existing installations.

J. F. Orr, Boise, described conditions in the Idaho territory, where range installations have developed an 11 o'clock peak load.

C. O. Dutton, Springfield, Ill., told of eight years of experience there. Their first thought was to sell to the wealthy people. Now nearly five hundred ranges are in use in the homes of miners. An analysis several years ago showed that 90 per cent of those purchasing electric ranges there were more than forty years of age. A recent analysis showed that only 60 per cent were persons over forty years of age, indicating that persons of smaller means and less established homes are entering the market. They used to think that it was impracticable to sell to the renter. They find now, however, that a very large portion of their customers are living in rented houses, many of whom pay for the services themselves and move the ranges when they move.

H. E. Young, Minneapolis, reported ranges on an established basis in that city, with more than three thousand ranges in service and sales running uniformly about 200 a month.

# Accounting Sessions

*Activities of the Accountants Are Broadening Each Year—Efficiency of Personnel Increases to Meet Greater Responsibilities*

A WIDENING outlook upon the industry, combined with a lengthening arc of contact with its administrative and operative problems, characterized the proceedings of the National Accounting Section, which culminated in well-attended sessions at the forty-sixth convention. The spread of the uniform classification of accounts into sixteen states and favorable prospects for its general adoption throughout the country in the comparatively near future mark the success of perhaps the most important work thus far undertaken by the section. General satisfaction in the acceptance of this classification was in evidence at these sessions. The co-operation of the various public utility commissions in this movement and the support of other national organizations have been vital factors in its advancement.

Improved methods of purchasing and storeroom accounting received much recognition at these sessions, with general agreement upon the importance of expediting procedure to take advantage of cash discounts and of reducing routine to the lowest practicable terms consistent with comprehensive and accurate records of operating transactions. Gratifying progress was noted in enrollments for accounting educational courses and in plans for the betterment of the advanced curriculum during the next few months. From all evidences the Accounting Section is hitting a stride toward higher planes of activity in which a closer co-ordination with other utility organizational tasks will be a dominant feature.

While considerable discussion took place at these sessions upon budgeting company expenditures, carrying forward the thoughts advanced last year upon this subject at Atlantic City toward the realm of wider application, there was general realization that the budget problem is destined to become more and more important in company planning. The subject is a very live one, and its scope is so broad that this year's program gave it a prominent place on the schedule. Billing by machinery, the insuring of property records, and the improvement of customers' records, security holders' records, payroll standardization practice, merchandising accounting and mortgage and trust agreements, received much attention. All these topics evidenced a larger activity on the part of accountants in utility affairs.

## Accountants Seek Greater Efficiency

**Gratifying Progress Noted Among the Companies in Acceptance of Uniform Classification, Stockroom Practice, Purchasing and Education**

MARKED evidence of the broadening of accounting interests was displayed at the opening session of the Accounting Section in the Hotel Biltmore, Monday afternoon, under the chairmanship of William Schmidt, Jr. General satisfaction was voiced at this session over the spread of the uniform system of accounts in the country and also over the growing interest of companies and employees in education and in improved methods of purchasing and storeroom procedure.

In his annual address the chairman of the Accounting National Section, William Schmidt, Jr., reviewed in considerable detail the history of this section during the past twenty-one years. In commenting on the uniform classification of accounts for electric utilities, which has been worked on during the year in conjunction with the National Association of Railway and Utilities Commissioners, Mr. Schmidt had the following to say:

"Now that the classification has been recommended, it remains for the Accounting Section actively to urge its general adoption. There still is much work to be done in seeing that it is accepted by all the regulatory bodies and that electric utility companies follow its rulings. The importance of accounting work in the successful operation of the utility companies, the absolute necessity and urgency of a uniform classification of accounts and a thorough agreement as to its interpretation by the regulatory bodies have been more fully realized of late. If the classification is followed and a harmonious interpretation is agreed upon by both the regulatory bodies and the accountants, little trouble may be anticipated in substantiating the statements or reports when called for in a rate investigation or by any other requirements of commissions."

Mr. Schmidt then commented briefly on the work of the various committees of the Accounting Section.

### Purchasing and Storeroom Accounting

This year the purchasing and storeroom accounting committee (J. F. Torrence, chairman) departed from the custom of previous years of reporting the practices of member companies and in its report has prepared and recommended a system for keeping purchasing and storeroom records. From the methods used by various companies which were obtaining almost identical results by different methods the committee has devised a system providing an alternative standard budget which

has proved satisfactory in actual use. While it is designed primarily for large and medium-sized companies, the smaller companies will find the principles applicable to their requirements, even though they do not follow the whole procedure.

The system, as prepared, divides the fundamentals or broad classes of the subject as follows: Ordering, purchasing, receiving and checking, storing, disbursements and returns, accounting, and material and supply purchasing.

A long discussion of the detail of handling invoices and remittances so as to take advantage of cash discounts followed the report, the speakers favoring the making of arrangements to insure this where possible. Several companies remit upon receipt of invoice or within the stated period of which the discount applies; others remit after receipt of shipment and by arrangement are still able to take the discount. Usually the invoice is kept in a suspense or other special account until the storekeeper announces the receipt of the material, and in many companies more care is being taken to insure that the stockroom follows these matters closely.

W. F. Stevens, Boston Edison Company, said that a recent study showed that about 54 per cent of the orders purchased through the stores department represented 2 per cent of the total value of orders thus placed. The importance of handling such orders through an emergency or petty cash account was touched upon.

J. E. Van Horne, Dallas, Tex., outlined the purchasing facilities of the Texas Power & Light Company, which serves 108 towns in twenty-one districts. Each manager has a petty cash fund of from $200 to $5,000, depending upon the territory. A large central storeroom is maintained through which orders clear when time permits. Requisitions are checked first against the material card system in the central stockroom, then by the operating department, and thence are sent to the purchasing agent.

C. E. Olwine, Newark, N. J., said that his company finds little difficulty in reconciling the inventory with the controlling account in the general ledger.

M. W. Glover, Pittsburgh, advocated discounting bills ten days after receipt of material. Ninety per cent of the West Penn company's bills go through without losing the discount.

C. E. Marden, Chicago, said that the Commonwealth Edison Company maintains a perpetual inventory with daily check-ups by five overseers who devote their time to visiting stockrooms.

In closing Mr. Brock said that the committee recommends that all requisitions which reach the purchasing agent should carry all necessary department head approvals.

## Accounting Education

The two courses of the Accounting Section showed a substantial increase in enrollment during the past administrative year of the association. The accounting education committee (Fred R. Jenkins, chairman) reported that up to March 1, 1923, for a period of twelve months since the previous report, it had obtained 287 subscribers for the elementary course as against 182 for the same period the year previous. For the advanced course during the year ending March 1, 1923, the committee received 107 subscriptions, as against seventy-three for the corresponding period of 1922. Improvement in the organization for grading and other detail work of conducting the courses has resulted in the elimination of virtually all complaints from subscribers. The correspondence service now is giving prompt and satisfactory results. The revision of the elementary accounting course of last year has resulted in a larger enrollment and much more satisfactory service. Interest in the accounting courses was greatly augmented this year by the Frank W. Smith prize, which President Smith donated to be awarded by the education committee.

WILLIAM SCHMIDT, JR.
Retiring Chairman

M. A. JONES
Incoming Chairman

During the past year there has been a marked improvement in the finances of the courses. Last year's report showed a deficit of $1,373.69, while this year a net surplus of $816.96 is shown. It was recommended that a special committee of a sufficient number be appointed to carry out a complete revision of the advanced accounting course, to be ready for enrollment by Oct. 1 of this year.

H. M. Edwards, New York Edison Company, highly commended the work of Mr. Jenkins and his associates, emphasizing the advantages of a high-grade accounting course, and E. J. Fowler, Chicago, urged the importance of revising the lessons in the advanced course, in order to include the latest thinking of the active practitioners in this branch of the industry.

Franklyn Heydecke, Newark, N. J., spoke of the growing interest of employees in the Public Service Electric Company in educational opportunities. Last year 103 enrolled in the course in practical electricity, nineteen in commercial engineering, and fifty-three in the advanced accounting course. The speaker said that his company has recently employed one man to take charge of educational work. He strongly advocated this plan for other companies, at least to the extent of placing the educational activities in the hands of one responsible and interested person.

## Preservation of Records

The committee on preservation of records (Franklyn Heydecke, chairman) made some very excellent recommendations for the safekeeping of valuable records and documents of public utility companies. The committee emphasized the failure of many companies to provide proper and ample equipment for the safe filing of valuable records. While it is possible to obtain record insurance, the cost is comparatively high, and the committee pointed out that the best solution of the problem appears to be absolute physical protection carried to its practical limit. As a means of preserving such documents as deeds, engineering reports, tracings and so forth, the committee recommended the use of either absolutely fireproof vaults, or if the volume of records to be kept warrants the expenditure, the use of an isolated document building. The committee pointed out that too often useless records are kept which only add to the fire hazards and recommended that there be a periodic destruction of such records. To this end an elaborate tabulation of documents and records, and the length of time which they should be kept on file before destruction, has been prepared by the committee.

C. S. Dressler, New York Edison Company, said that this organization is now centralizing its records and putting them in proper order. E. J. Fowler, Chicago, suggested that the committee should draw up rules and standards for the destruction of old papers, which should be a matter of good housekeeping, in view of the interference and danger resulting from excess material. J. R. Abercrombie, St. Joseph, Mo., urged taking the initiative in the destruction of useless records; otherwise utility commissions may establish regulations to this effect which may be inconvenient. J. G. Reese, Baltimore, touched upon the difficulties of securing adequate insurance on records and other data destroyed by fire. Basement vaults are of dubious value on account of possible water damage. Personnel records should be kept a reasonable time, perhaps more than three years, on account of the possibility of damage suits or other legal proceedings.

An informal report on behalf of the filing systems committee was presented by T. G. Spates. This committee has not held a meeting as yet.

# Uniform Classification in Sixteen States

## Fixed Capital Records and Handling of Discounted Bills Arouse Keen Discussion—Keeping of Accounts Under Federal Classifications Obviated

SATISFACTION with the general movement toward standardization and increased efficiency as indicated by the progress toward uniformity in accounting was expressed at the second accounting session. With one-third of the state commissions now using the uniform classification of accounts, it is confidently expected that the remaining two-thirds will adopt the classification within the coming year.

### Accounting, Classification of Accounts and Annual Reports

Promoting the adoption by public service and other commissions of the uniform classification of accounts recommended by the National Association of Railway and Utilities Commissioners has been the chief aim of the committee on classification of accounts and annual reports, of which W. J. Meyers is chairman. The classification has now been adopted as official by commissions of the following states: Alabama, Arkansas, Colorado, Idaho, Illinois, Kansas, Michigan, North Dakota, Tennessee, Utah, Virginia, Washington, West Virginia, Wisconsin and Wyoming.

Massachusetts has issued a classification so nearly like the National Association classification that for the purpose of uniformity it is considered that she is in the list of states adopting the uniform system.

In addition to appearances before state commissions, representatives of the committee conferred with representatives of the Federal Power Commission and others in a discussion of its official classification for use by licensees under the federal water-power act. As a result the elimination of some of the objectionable features found in the earlier federal tentative drafts was brought about, and it was agreed to recommend to the National Association of Railway and Utilities Commissioners certain changes in its classification, principally in connection with the abandonment of its group of accounts for transmission and distribution. Further recommendations resulting from the Federal Power Commission conference were for a single account for taxes in the income statement and for the more general inclusion of minor rents among operating expenses.

In addition to its work in connection with the uniform system of accounts, this committee, in conjunction with a similar committee of the American Gas Association, developed a form of annual report which contains in the space of sixteen quarto pages all of the information essential to the administration of public utility statutes of the various states and appropriate for embodiment in annual reports.

### Development of the Uniform Classification of Accounts

The development of the uniform classification of accounts on which the committee on statistics and accounts of public utilities has been working in collaboration with the National Association of Railway and Utilities Commissioners was traced by Fred. W. Herbert, superintendent of the service department of the National Electric Light Association. Much of the committee's time during the last year has been devoted to bringing together the classification of the National Association of Railway and Utilities Commissioners and that of the Federal Power Commission under the water-power act. While the two classifications differ materially, it will not be necessary for licensees under the water-power act to keep separate accounts for the two classifications.

A provision made in Section 3 of Regulation 20 of the Federal Power Commission "Rules and Regulations" is quoted as follows: "If the records and accounts of licensees are kept and maintained under and in conformity with accounting rules and regulations prescribed by public utility commissions or other commissions or regulatory bodies of the state or states in which the project is located, the licensee will not be required to maintain also the system of accounts prescribed by Section 1 of the regulation, but the system of accounts prescribed by the state regulatory body may be substituted therefor if desired."

Inasmuch as the classification of the National Association of Railway and Utilities Commissioners, as now amended, meets the universal requirements of the utilities and the regulatory bodies, the committee feels that this classification should govern. As a matter of fact, where the state commission's classification is followed the licensees under the federal water-power act will not be required to keep both the federal and national classifications of accounts.

The National Association of Railway and Utilities Commissioners' classification of accounts can be used as a basis, and companies operating under the water-power act can incorporate in their accounting methods those special accounts which are made mandatory by the water power act only as additional accounts and be able to report to the Federal Power Commission accurately the transactions of their company. The classification as prescribed by the National Association of Railway and Utilities Commissioners applies more strictly to the operation of electric utilities in the several states and is in no way an interference with utilities operating under federal license.

With the presentation of Mr. Herbert's account of the development of uniform classification, H. M. Edwards, for the executive committee, offered a resolution to adopt the uniform classification of accounts as approved by the National Association of Railway and Public Utilities Commissioners. Upon motion the resolution was unanimously adopted by the Section.

### Accounts Payable Records

The report of the committee on accounts-payable records, which was read by T. Wright in the absence of E. A. Davis, chairman, covered investigations of forms and methods in use by ninety-two average-size companies. Machine methods of vouchering were not considered in the report, as the committee felt that such methods would be applicable only to the larger companies. Particular attention was given to the methods of vouchering, including detailed information on numbering, indexing, forms, voucher register and cash disbursement records.

When describing the methods of vouchering, the committee found that where there are comparatively few the vouchering can be delayed until very late in the month and in some instances into the first few days of the following month. This method is ideal in that it reduces the number of vouchers to a minimum, but unfortunately cannot be followed by the larger companies without greatly increasing the vouchering force at the vouchering period to prevent an undue delay in the completion of the month's work. To overcome this peak in vouchering, recourse is had to voucher more frequently, either periodically or daily.

Under the periodic plan the invoice file is gone through at stated intervals during the month, say on the 5th, 15th and 25th, and all incidental invoices on hand are vouchered, withholding invoices from firms with which there are a number of transactions each month. These are Allowed to accumulate until the close of the month or until they have reached the maximum number of invoices assigned to a voucher. With companies having a very large number of invoices each month daily vouchering is necessarily a continuous operation. Under this plan also it is the usual practice to allow invoices to accumulate from those firms with which there are a number of transactions each month.

Where the vouchering is not continuous it is necessary to go through all invoices before filing and extract all discount items, which are vouchered immediately. When discount items are paid prior to the receipt of the material covered by the invoice, it is the usual practice to charge the net amount to the vendor's account or to a suspense account until the material is received, and it is then transferred by journal entry to its proper account. This process assures an exact account for the material, which might not be the case if the vouchering and payment of the invoice

closed the transaction. Some companies do not make a practice of taking discounts if the material is not received within the prescribed time for discounting, unless the amount of the discount is of consequence and the vendor known to be reliable.

The question of handling discount items aroused keen discussion by the members present. C. L. Hall thought it best to have all items approved first by the purchasing agent. M. W. Glover was in favor of charging all material to the material and supplies account and charging no material to construction or operation before knowing whether or not it was received and what the invoice called for.

### Fixed-Capital Records

The reports of the fixed-capital records committee (C. M. Breitinger, chairman) presented a simple system based on the association's standard classification of accounts for keeping records of fixed capital. In accordance with last year's committee's definition of fixed-capital records as a continuous inventory record of the physical unit of property and plant, showing values reconcilable to book values and kept in sufficient detail clearly to locate and identify each property, this year's committee developed the system by dividing each of the accounts No. 311 to No. 345 inclusive into sub-accounts, each sub-account to care for a unit or a set of units of plants such as would give a simple record of the property. Included in the report were general instructions applying to the proposed system as a whole and to the several accounts, detailed instructions for treating the said property covered by each individual account and specimen sheets illustrating the application of the foregoing instructions. In all of this work the desirability of simplicity and the later opportunity for elaboration were kept prominently in mind, and in cases of doubt the simpler method of classification was adopted. The application of the system was shown in appendices submitted with the report.

The report covered only the allocation of charges appearing in work orders, which in turn are charged to the aforementioned accounts, and the correlation of these charges with units of property. The committee left for the future such further development and expansion of the fixed-capital records system as might be undertaken by the larger companies. In the available time, it was not possible for the committee to reach final conclusions on two technical problems which were left for future consideration. These were (1) the basis of valuation required for initiating fixed-capital records and reconciliation with general books, and (2) treatment of overhead and other undistributed costs and intangible costs.

After briefly summarizing the report, Mr. Breitinger suggested two possible methods of starting fixed-capital records: (1) By appraisal to be made carrying a reconciliation on the books for the difference in appraisal and book values; (2) by book value distributed on a proportionate basis with appraised value, thus eliminating the factor of reconciliation.

H. M. Edwards desired to go on record as opposed to any method of using appraisal, life tables or other "abominations" for arriving at fixed-capital accounts, taking exception to the committee's recommendation. W. J. Thorpe emphasized the fact that because of the lack of fixed-capital records in the past appraisals are costing companies a great deal of money and trouble to reconcile valuations before commissions. He urged the use of a work-order system which should be carried out in considerable unit detail, giving costs for both material and labor.

Mr. Breitinger closed the discussion, pointing out that a method of setting up a fixed-capital records system is essential for rate-making purposes. He also said that it was the intention of the committee to present only a basis on which future committees can develop and expand the system.

# Accountant the Pilot of the Business Ship

## A. Monro Grier of the Canadian Niagara Power Company Tells Accounting Session the Accountants' Position—Machine Billing Receives Favorable Comment

SPEAKING on "The Value of the Accountant to the Industry" before the accounting session Wednesday afternoon, A. Monro Grier, Canadian Niagara Power Company, a past-president of the Canadian Electrical Association, said that the accountant must be able to furnish his executives at all times with the information on income and earnings necessary for rate cases before regulatory bodies. "He must keep constantly informed," said Mr. Grier, "of the existing financial trends, know the rules and regulations of public regulatory bodies and the laws established for taxing purposes." In financial matters he must be able constantly to supply the best methods of avoiding possible pitfalls. His position makes him the recorder of the company activities and virtually the pilot of the business ship. He is the doctor who must diagnose the business ills of the enterprise and the one executive official, if any, who is entitled to a seat on the executive board so that he may know intimately the problems of the business. Mr. Grier closed with an eloquent plea for the maintenance of friendship between the British and American people. He extended an invitation to the delegates to attend the Canadian Electrical Association convention at Montreal, June 21-23. A similar invitation was extended by P. D. Davies, president of the Canadian association, and F. W. Fee, vice-chairman of the Accounting Section of that association.

### Customers' Records and Billing Methods

The report of the committee on customers' records and billing methods, of which B. F. McGuire is chairman, includes a classification of billing costs for comparative purposes to be used as a help to the standard classification of accounts. It offers a basis upon which member companies can make comparisons of their billing costs. The classification of billing costs includes the items of meter reading, billing, duplicate bills, bookkeeping, bill delivery, credit and correction, customers' statistics, general supervision and total yearly cost. This classification is further divided by giving for each of the foregoing items the number of employees, cost per meter in service, cost per bill rendered and cost per customer. It is accompanied by an explanation of the different items listed in the classification.

During the year a sub-committee on methods and office appliances (J. F. Ford, chairman) was organized for the purpose of furnishing the smaller companies with details of the systems and office appliances in use by companies of similar size. Within the past year a number of member companies have been conducting tests with machines to be adapted to the customer's billing and bookkeeping work; also, tests of the Baltimore system modified and adapted to the individual needs have been made. The committee, however, did not believe that this work had been developed far enough to be presented at this time.

The discussion on the report of this committee was directed first to the "bookkeeping without books" methods of the Baltimore Consolidated Gas, Electric Light & Power Company, and favorable comment on the method was made by men experienced in it. The discussion of the comparison of costs of billing was summed up by Chairman McGuire, who pointed out the effect on costs exercised by complicated rate schedules and said that in using the classification suggested by the committee the companies planning to compare costs should get together and decide on how the work is to be carried out so that there would be no uncertainty as to the value of the comparisons.

Machine billing came in for comment, mostly favorable, but some unfavorable, as to costs as compared with older methods of billing. The experience of those who have used machine billing as expressed in the discussion indicated material savings where there are a large number of customers to be handled. The secret of saving of cost seems to lie in the combining of operations that under pen-and-ink methods must be handled separately.

### Budget

During the past year the budget committee (D. W. Harris, chairman) attempted to establish contact with member companies carrying on the study of the fundamental principles of budget development and offering solutions for some of the principal problems met in budget administration. As, however, the report of the committee presented at last year's convention was not received until the middle of February, 1923, there was not sufficient time for the committee to obtain opinions of member companies on the complete report outlining the methods of budget preparation and administration. The committee therefore recommended that it be permitted to continue its researches for another year with a view to completion of the work already begun and of giving the association the benefit of further development in budget procedure. The report included discussions of practical problems met in budget administration, development in methods, construction and cash budgets, use of materials and supplies budgets and the procedure in preparing a budget under different conditions.

In presenting the report Vice-chairman H. A. Snow, Detroit Edison Company, emphasized the thought that the budget is not a financial instrument, but a means of controlling and directing business activities that is of valuable assistance to all employees of a company as well as to the officers. The period for which the budget is prepared is not important, though he said it should be for as far in the future as possible. That a budget is a strict limitation of expenditures Mr. Snow characterized as a fallacy. The budget should be flexible so that it can be changed as needed and plans altered as new conditions develop. Mr. Snow viewed the budget as a guide rather than a control instrument. He gave as one of the important problems the getting of dependable estimates. Estimates should be made by the heads of the departments responsible for the work, and four budgets, one each for construction, operation, storeroom stocks and cash, were recommended.

Louis F. Mussel, Cities Service Company, asked for the consideration of the budget not merely from a dollars-and-cents basis but as a means of developing the human abilities of the business organization.

### Payroll Standardization

The payroll standardization committee (A. B. McCoard, chairman), after examining approximately fifty systems in use by various companies, prepared a tentative method which was outlined in detail in the report. The proposed method recommended the organization of a personnel department and an employment bureau if the size of the company warranted such procedure. The desirability of centralized payrolls was pointed out, and methods of reporting and checking time were explained, with suitable forms for this purpose.

# Renewal Reserve Analyzed

## Hon. Carl D. Jackson Presents Masterful Analysis of Reserve Accounts—Need of Revised Merchandise Account—Election of Officers

THE fourth and final session of the Accounting Section reached a fitting climax to a year notable for its accomplishment when it listened to Hon. Carl D. Jackson's remarkable address "Renewal Reserve." Calling attention to the fact that the word "depreciation" is nowhere used in the uniform classification of accounts Mr. Jackson pointed out that if a utility is well maintained and is rendering good service to the public there should be no element of depreciation of its property. Only when the physical property has actually been allowed to run down through neglect can the value be depreciated.

### Merchandising Accounting Committee

The formation of the merchandising accounting committee, P. H. Myers, chairman, was the outgrowth of the meeting of the joint merchandising policy committees of the National Electric Light Association and the Association of Edison Illuminating Companies held in New York on Jan. 5, 1923.

Classification of merchandising accounts was adopted for use by all of the companies represented on the committee, each one agreeing to apply it to his own merchandising activities.

After the presentation of the report Herbert A. Wagner of Baltimore called attention to the importance of merchandise sales to the central station company but warned that it must be conducted on a profit making basis, and stated that executives were looking to the accountants to provide the proper means of analyzing the business. "Merchandising is one of the greatest possibilities of our business," said Mr. Wagner, "but if the central station cannot make a profit, how can we expect others to engage in the business and thus bring about the great volume of sales which we all believe possible?"

Speaking in the same vein, W. A. Jones said, "It is a sad thought that many companies have not gone into merchandising, which appears to be the keynote of central station business. This situation may be attributed to the cry 'it is not profitable' which has been caused largely by inaccuracy of records which have led to an entirely wrong conception on the part of executives." Mr. Myers stated that eleven companies are now co-operating in the application of a uniform system of merchandising accounts providing for the operation of the department as an entirely separate business from central station operations. Results of this trial application will be reported at a later date.

### Security Holders' Records

The security holders' records committee (George B. Thomas, chairman) devoted most of its attention to the consideration of the legal requirements concerning the transfer of stock certificates. The statutes of the state in which a corporation is organized, federal revenue laws, the charter and bylaws of the corporation and the laws of the states in which stockholders or their representatives reside are often of vital importance in determining whether or not a corporation can transfer stock upon its records without subjecting itself to civil liability or fines and penalties. The report outlined in some detail the legal requirements for stock transfer, nature of stock certificates, variety of laws affecting the transfer, liability of the corporation, test of authority to transfer, handling of lost certificates and a set of instructions which has been used successfully by one company in its transfer department.

In view of the customer-ownership plan adopted by many large utilities, the committee urged the advisability of a utility cultivating the good will of its stockholders by assisting them in every way possible to transfer their shares in accordance with law and approved practice. The committee pointed out that a company which flatly refuses to make transfers unless certain legal requirements are met, without supplying information as to the practical steps and forms necessary, raises obstructions and invites dissatisfaction.

### Mortgage and Trust Agreements

A detailed report on mortgage and trust agreement (W. C. Lang, chairman) embraces a description of mortgage securing bonds and a general analysis of the various types of mortgages now outstanding against public utilities. Among the outstanding recommendations of the committee was a form of mortgage permitting the issuance of bonds of different series in respect to interest rate, dates, maturity, redemption and other provisions in preference to a single series indenture, as, under this arrangement, a utility has one mortgage with several series of bonds in place of many different indentures. Among other recommendations was that a definition of net earnings, when a requirement for the issuance of additional bonds, should clearly indicate that the amount set aside for the purpose of maintaining a reserve for property retirements should not be included as an operating cost.

The following officers were elected unanimously for the ensuing year: Chairman, W. A. Jones; vice-chairmen, W. Paxton Little, W. C. Lang and A. R. Patterson; members at large, C. M. Breitinger, E. A. Davis, W. H. Hodge.

President Smith, at the close of the meeting, expressed his appreciation of the hearty support of the Accounting Section during his administration.

# Symposium on Public Relations

***Outstanding and Critical Importance of Complete Understanding Between Public and Public Utility Frankly Discussed by***

W. D. B. AINEY, *Public Service Commission of Pennsylvania.*
ALEXANDER FORWARD, *Virginia Corporation Commission.*
E. V. KUYKENDALL, *Washington Department of Public Works.*
CLYDE M. REED, *Kansas Public Utilities Commission.*
H. G. WELLS, *Massachusetts Department of Public Utilities.*
MARTIN J. INSULL, *vice-president Middle West Utilities Co.*
JOHN B. MILLER, *president Southern California Edison Co.*
HENRY L. DOHERTY, *president Henry L. Doherty & Co.*
W. W. FREEMAN, *president Union Gas & Electric Co.*
ARTHUR WILLIAMS, *general commercial manager New York Edison Co.*

AN INSPIRING symposium on public relations, was the program of the third public relations session of the convention. It is impracticable to present complete reports of all ten addresses, but abstracts follow here.

### Commission the Balancing Agent Between Public and Utility

BY W. D. B. AINEY

The relation between utilities and their patrons is to be expressed, it seems to me, in a formula, but not an ordinary formula. It is a formula of equation, simple and recognized by every one academically, but in the application of it very frequently misunderstood.

On the part of the utility there is the responsibility to render adequate service, and the corresponding privilege and right that grows out of that responsibility is that the adequacy of service shall be supported by just and reasonable rates. On the public side, consumers are entitled to receive at the hands of the utilities adequate service, and the duty which falls upon them is to pay a reasonable rate.

That is the formula—so simple—yet there has been a difficulty in its application. I think a part of that difficulty arises from the fact that the utility companies themselves have not carried their end of the program and problem to the knowledge of their patrons, and therefore they, the patrons, have not had at all times a clear understanding of the difficulties that confront the companies.

You know there are those who think that the great problems of life are ones that can be solved from the standpoint of the logician. Never was a greater mistake made. The emotional characteristics of mankind are the factors which in final analysis control his life and control the nation. It is not cold logic by which men judge either social, economic or political affairs; but it is those other things that when rightly related make up the finer sensibilities and expression of man. The interrelationship that comes between two men who have established a friendly handshaking acquaintance brings them to a conclusion that no amount of controversy on printed page would ever bring.

As to the public service commissions, the conception of the Pennsylvania commission is that it must maintain a fair balance as a corrective body, and whenever there is inadequacy of service it meets the complaint by an appropriate order. Whenever the rates are unjust and unreasonable, either from the standpoint of the utility or the standpoint of the patron, it meets that emergency, and we have attempted to do so fearlessly, without any question of whether it was politically suicidal or whether it was not. When the day comes in Pennsylvania that any other conception of public responsibility shall actuate the Public Service Commission, then I will present my resignation immediately.

### A Utility with Good Public Relations Seldom Appears Before Commission

BY ALEXANDER FORWARD

You who are responsible for this very thing should know better than we of the regulatory commissions can possibly know that your treatment of your patrons may mean all the difference between success and failure, and that in your dealings with state tribunals, the rate-fixing powers and the city councils that grant or refuse municipal franchises the attitude of the public toward you is of the utmost importance. You already know that no executive who does not maintain the proper attitude of mind in this respect can for long retain his standing with his stockholders, nor, therefore, his position.

In my state—Virginia—the utility that receives the most considerate treatment at the hands of the public and its representatives is the one that never finds it too much trouble to talk things over through a responsible representative with a complaining individual. And the utility made to face the most persistent opposition to its proposals is the one whose organization is permeated with an attitude of indifference to the public and which, when ready to take any step, apparently gives no thought whatever in its own councils to the impact of its proposals upon the public mind.

In any state now where an electric utility has sold a large amount of preferred stock to its patrons, largely through its own employees and through local advertising, when any citizen asks the city council or the chamber of commerce to interest itself in securing a reduction of rates, the patrons who have that direct interest in the success of the business fall upon the said city council or chamber of commerce like a thousand of bricks to protest against any effort to impair the success of the company and injure thereby its service.

Some of our utilities, many of them in fact, recognize the fact that expert, intelligent and progressive service can succeed in part only unless the public knows about it. Many others do not indicate their grasp of this important point. Now, newspaper space costs money, but when intelligently used it is worth the price; and if it is not too much trouble to explain things to a patron, it certainly cannot be too troublesome to address meetings of civic and luncheon clubs and tell them what electric science is doing and planning in general, and what the utility in point is doing and planning.

All newspaper publicity does not have to be paid for. I pursued the newspaper business for twenty years, unless it pursued me, and I know that anything that the newspaper writer knows is going to appeal to the public imagination will receive from him a ready and responsive hearing.

### Educate by Introducing Utility Regulation Into Civics Courses

By E. V. Kuykendall

Errors of regulatory bodies are more likely to occur on the side of the public than of the utility. An examination of court reviews of commission decisions will demonstrate this to be a fact. I believe it is safe to say that state and federal courts have held three commission decisions unfair to the utility where they have held one unfair to the public.

Conceding that commission regulation should be continued, at least until something better has been devised to take its place, what should be done to insure its perpetuity? Commissions are creatures of the legislature, and the average legislator reflects the sentiment of his constituents. Unfortunately, many politicians are followers rather than leaders. The remedy, then, lies in an open, candid presentation of the facts to the public mind, the substitution of truth for error, and the eradication of prejudices born of ignorance and misinformation.

For some time I have believed and advocated that the fundamentals of valuation, rate making and regulation should be taught in the public schools as a part of civil government. These functions have become such important governmental activities, both national and state, that they should be included in textbooks on civics. A person informed on these topics would cease to be putty in the hands of the demagogue whose specialty is corporation baiting. For instance, if he understood even the rudiments of valuation, he would know the absurdity of the oft-repeated charge that regulative commissions are permitting utilities to make earnings on watered stocks and inflated bond issues instead of the value of the property devoted to public use. He would know that under regulation it is impossible for a utility to profiteer.

A good deal has been accomplished by your committee. Some steps have been taken toward the endowment of a chair or chairs in universities, but I cannot feel that that is the important thing. The important thing is to have those subjects taught in the public schools so that every high-school student will gain a knowledge of the fundamental principles which lie at the bottom of valuation, rate making and regulation. The pupils will go home and talk to their parents, and in a very short time all of this misinformation, this misunderstanding about utilities and about regulation, will disappear.

There are cases where utilities have incurred the ill will of the public by long-continued discourtesy or want of tact and diplomacy on the part of their employees or officials. In such cases the only remedy is a complete change of attitude on the part of the company. This change should begin by the discharge of every roughneck manager or discourteous employee who comes in contact with the people. Courtesy will gain and hold more friends and patrons than cheap rates and sheer efficiency combined.

Correct common prejudice through the unfailing exercise of courtesy, tact and diplomacy at all points of contact with the public. Educate along utility and regulatory lines. Reach the children in the schools, the men on the streets, and families in their homes, with a human and sympathetic appeal.

The electric companies have passed through the same character of hardship and vicissitudes that beset the pioneer home builders of both the Atlantic and Pacific slopes. They are entitled to a measure of the homage and appreciation so justly accorded the sturdy pioneers who risked all in the reclamation of the waste places of our continent.

### Good Public Relations Will Be Most Appreciated if Adversity Besets the Industry

By Clyde M. Reed

The fact now is that you folks have all the best of it. The fact is that you represent one of the rapidly expanding industries of the United States, if in fact it is not the most rapidly expanding. Your colleagues in public utility organizations have met with more difficulties than have you, and in making that statement and in drawing the conclusion that is to be drawn from that statement I am not underrating the intelligence with which you have approached your problem, even though I believe that that intelligence is greater than the approach to any other public utility line of business in the country.

The fact is that you have all the advantages of the public utility game in the rapidly developing needs of the public for your service. But if Henry Ford ever comes along and invents a match that will burn a whole day and a whole night and furnish heat for stoves and light for a whole residence, then you gentlemen will have your troubles just as the street car and electric companies have had theirs. You will then appreciate and need your public relations.

We live today in the age of the world's greatest romance, and you gentlemen, more than any other class of people I know, personify and reflect the execution and the desire of the most romantic thing in the history of the world.

It is up to you gentlemen and up to this association to continue along the lines of the very great efficiency that you have developed, along the lines of the great public usefulness that you have developed, and along the lines of continuing to aid and perfect and assist and carry on the development of our civilization.

If you fail to dedicate yourselves to that purpose, you will have failed to accomplish the great possibilities that lie before you.

### Individual Private Contracts Ultimately Make Up Public Relations

By Henry G. Wells

It is an interesting fact that the various complaints we receive in Massachusetts, in the gas and electric division, are confined virtually to one-fourth of the companies. And it is an interesting fact that those complaints from the public have all followed along certain definite lines as affecting the individual companies. In other words, they are characteristic complaints in each instance.

Of course, it may be said that companies in a large

community are handicapped, that companies that are near to the commission are handicapped, but a study of those complaints and of the one-quarter of those companies absolutely disabuses one of that idea.

There are companies that take the attitude that the customer is always right. That is not a natural attitude. There are other companies that indicate by their attitude, in spite of all the advertising they can put in the newspapers, that the customer is always wrong.

It is sometimes difficult to know whether to say that a customer is always right or always wrong; but let me give you one illustration that we had. It was an application for service. The company replied that it would require eight poles to connect up with the nearest line. The applicant, who was a very vigorous young lady, wrote back and said that the line ran right by her house. The company wrote back and stated that that must be some other public utility—perhaps the telephone company. The young lady went out and made a drawing of the stencil on the poles, took the numbers of the poles and sent that in to the commission. The commission communicated with the company, and the young lady received service.

That is just an illustration of the fact that the customer may sometimes be right, and perhaps after all it is a good idea, when an applicant states a certain thing as a fact, to investigate it.

### ORGANIZATION IN PUBLICITY WORK

No matter how much you may advertise, no matter how much you may inaugurate a publicity campaign, unless your companies are so organized, or organized in the same way that your engineering departments are organized, you are not going to be successful in a publicity campaign.

However, the great majority of the companies are carrying out your teachings on public relations. But the other companies that have not organized their public relations department upon the same basis that they have organized their accounting and engineering departments ought to do so.

It seems to me that the companies that have the most trouble to organize should call on these companies that have not had trouble and study the particular features in which difficulty has arisen. The companies that have failed have done so because of certain characteristic features, and that is indicated from the fact that complaints affecting the different companies are almost invariably along certain definite lines. In one company it is a failure in the adjustment division and not in the commercial division; in another particular company it is a failure in the commercial division and not in the adjustment division.

[Mr. Wells related several incidents of complaints which had come before the commission, to show how simple and commonplace some of the cases are which cause misunderstanding and how easily they yield to the application of ordinary common sense and a mutual desire to play fair.]

I say to you in conclusion simply this: In your several states study the situation and find out whether there are certain definite lines along which the public service companies are falling down, and then correct them. That can be done in Massachusetts, and I have no doubt it can be done in every other state. The great majority, as in Massachusetts, of your public service corporations are doing the best they can, and I believe that they all sincerely desire to do their best.

## Many Executives Not Yet Awake to Necessity of Public Relations Effort

BY MARTIN J. INSULL

I can honestly state that I think this industry is very greatly indebted to the public service commissioners of this country for the treatment it has received during the past few years. I don't mean by that that we have always got exactly what we wanted, but, taken by and large, we have received a square deal, and that is the most that we should ask for.

One of our greatest duties in this work of public relations is to so mold public opinion that public opinion supports, as far as possible, the action of the various commissions of the various states.

Commissioner Ainey very tersely gave us a formula for the utility business: Adequate service at reasonable rates. That is what we want; that is what the public wants. Why is there any difficulty between us and the public? The real difficulty is that our ideas of adequate service and their ideas of adequate service are probably the same, but our ideas of reasonable rates and their ideas of reasonable rates may be entirely different, because the subject is approached from a different point of view.

We approach it with a full knowledge of the utility business and the economic fundamentals of the business. As a general proposition, the public approach it without that equipment.

Who is responsible for the situation in which the public finds itself? Are not we? There is nobody else to tell it the fundamentals of our business unless we tell it to them. Are we to sit idly by and let people be misinformed by the political demagogue? Certainly not.

I agree that one of the best places to start is in the schools. We have already started to do some work in that direction. We can do more and more to a very great advantage.

Now I am not going to let you people sit here and take a compliment that I don't think you deserve. One of the commissioners said it was unnecessary to talk to you utility men about the necessity of good public relations. I do not agree with him. I think there are many men in our industry (and there may be men in this room) who have not yet caught the vision of what this public relation movement means. If you will sit down and quietly think about the utility business, you will come to the conclusion that the greatest interest in the utility business does not lie in the operator, but it lies in the public.

Take the question of reasonable rates. A misinformed man's idea of reasonable rates is the lowest rate he can possibly get for any particular service, yet a low rate might wreck the very industry which is his life's business blood.

To me the question of rates does not become of any importance until you consider the question of finance in the industry. It is there where the rate makes its greatest importance, because this industry cannot go forward, as it should go forward unless it can establish a credit that attracts money to it. That credit cannot be established unless it receives a rate that will establish that credit.

Now, neither you nor I can change public opinion alone. We can start, but this work has got to be done through our whole organization. We have got to support it.

Every man and woman in the organization of

an electric light and power company should thoroughly understand the importance of a favorable public opinion toward this great industry all over the nation.

## Utility Commissions Should Use Publicity to Interpret Their Decisions to the Public

BY JOHN B. MILLER

Publicity is very largely responsible for our relations with the public, and the commissioners, to a degree, are responsible for that publicity. The suggestion which I have to make is that no public utility commission is properly organized without a first-class expert publicity man to get the message, the real gist of their decisions and actions over to the public. I don't mean to get out reports. Who reads them besides us? The public does not. I don't mean long articles in the newspapers that are garbled, or even if they are in full are not properly news stuff. The publicity man of the public utility commission should take a rate order, for instance, prepare his stuff with headlines which tell, in a few words, just what has happened and why, and then let the rest of the story give an interpretation. But the headlines must be right, for that is what our public reads.

I think commissioners should be impressed with the fact that that is a proper and necessary part of their function in connection with the industry as a whole. Publicity can be good and it can be bad. It is very important that our commissioners should have good publicity.

## Commissioners Should Take Notes of Failings and Tell the Industry About Them

BY HENRY L. DOHERTY

I have sometimes been afraid that the almost unanimous indorsement that the electric light men have given to public service commissions would make the public think that we like public regulation by state commissions, and very often anything that we want they conclude must be wrong. Anything that we like they often conclude is not in their interest. As a matter of fact, of course, we are not seeking regulation, but if we must be regulated, we want intelligent regulation.

I want to say a word for the state commissions that perhaps has never occurred to most of you gentlemen, although I suppose it has occurred to them. I think we have all learned a good bit from public regulation by state commissions. I think a great many of us were in a rut; we didn't realize what we could and what we could not do.

I wish that we could have as many of the public service commissioners as would do so make a note all through the year of everything that they observed where they thought the public service company was wrong and come to our convention and tell us about it. In the last analysis, service cannot be merely lip service, and I know, having been the active manager on the job, how difficult it is to make every employee realize that he must do everything he can to give that customer what he thinks he wants, regardless of whether we think it is what he wants or not.

I am one of the advocates of making a customer pay for what he gets. I believe in that theory, but I believe in the other thing of letting him have what he wants, but be sure to be able to serve him with what he does pay for.

How many rules have you got that are good for nothing except to have holes shot in them? Then how often, if the man could get into your office—and here is the thing that is hardest of all to guard against—if you could deal with every customer you could put a smile in what you had to say and you could put it there in the right sort of way. You can tell your man to be courteous at the desk, but courtesy with him is often a kind of an insulting thing. You have got to make him feel in his heart that he is trying to serve the public, that he is trying to give each customer what he wants as nearly as possible.

I am very serious and I believe I voice the sentiment of most of the men in this meeting when I say to these commissioners that we invite intelligent criticism, that we would welcome having them make a note of everything that goes wrong that they see in the course of a year, come to our conventions and tell us about it.

I believe that our commissioners can do something more. It must be plain to everybody that we never can have peace if either the buyer or the seller is going to fix the rates. That is the great justification for the state commission. Of course, as one speaker pointed out properly, the state commission must necessarily lean toward the public, and the majority of decisions must be in favor of the public. Nevertheless, the commissions are a more disinterested body than either the buyer or the seller, and there is a chance for peace.

I am heartily in favor of this particular program that we have had here today, in inviting these public service commissioners in here to talk to us, to let us get closer to them and to figure out the problems that they are charged with and that we are charged with, because we are both charged with the duty of giving service to the public. They can't do it unless they know our position, unless they know us and know what we are working for and how we are working to it, and we can't do it withou knowing them.

## After Forty Years of Inaction at Last Utility Men Compete for Excellence in Public Relations

BY W. W. FREEMAN

It occurs to me that some of us may question in our own minds why it is not until the forty-sixth convention of this association that we devote so much time and give so much importance to the subject of public relations. In my opinion, that does not indicate that we have been asleep or that we have been neglectful of opportunities in the past. It means, rather, that in the evolution of our industry and of our business development we have reached a time when this subject becomes of very much more importance and very much more essential than it has been in past years.

Whereas previously we came in contact directly in a business way with perhaps 5 or 10 or 20 per cent of the public, now our ambition at least, if not our realization as yet, is to have business relations with 100 per cent of the public we serve.

But some of us—perhaps many of us—have had too little ambition, have had too little realization of the possibilities of the establishment of really friendly relations with our consumers. Whatever the facts may be, the thought is projected at this convention that proper public relations between the companies and their consumers can be secured. We enter into competition with each other as to how rapidly and how completely we can bring about that situation in our respective territories.

Our job is to see how quickly we can be in the forefront of this movement rather than merely act as the followers to those who do lead.

The solution of the public relationship problem can perhaps be voiced in two thoughts—one hundred per cent service, one hundred per cent publicity. One hundred per cent service means service unaffected in any detrimental form at any point of the operations where improvement is practicable. One hundred per cent publicity does not mean merely advertising, but placing before the public and before the consumers all of the facts the knowledge of which will assist to promote friendly relations.

### We Win Public Confidence and Esteem by Meriting It

BY ARTHUR WILLIAMS

Public relations to my mind is the most important question that is before our utilities today. I think it is greatly to our advantage as a great utility group to have the utility commissioners know us, and I think it is very important for us to know the men who are representing the public in these offices of public service control. I am convinced that antipathies, differences of opinion, disregard of regulation by fair men, all disappear when we get together in such meetings as this.

To my mind regulation has greatly strengthened the character of our relations with the public; it has, speaking from our own experience, greatly strengthened the confidence of the public in ourselves as utilities, but the thing that we need in holding office in public service control and regulation is that our commissioners shall not be subject to abuse and to the danger of being thrown out of office whenever they make a decision, whether it be for the utility or for the public, against the utility or against the public, which, in their judgment, is a fair decision.

To my mind, the tenure of office should be that which is given to our judges, and our public service commissioners should be so placed in their office that they shall be immune from the danger of removal because they give fair decisions based upon economic and not political conditions as they arise from time to time in their respective jurisdictions.

Our constant effort should be, day in and day out, to win the highest degree of public confidence and esteem by meriting it in every act of our company.

I just want to make this point where, I think, we have perhaps been negligent in the past. That is with reference to the training of men and women for public service. While we train our engineers and our accountants, we very often are somewhat haphazard in picking the men who represent us in the far more direct part of our business with the public. We ought to give just as much thought to the training of men and women of our companies that come in contact with the public as we give to the technical engineer or to the chief accountant.

The most priceless asset we can have as utilities is good and favorable public opinion, and too much attention cannot be given to its acquirement by our utilities.

# Necessity of Good Public Relations*

***Public Policy Committee Outlines Important Problems Confronting Industry and How Favorable Public Opinion Aids in Their Solution***

THE broadest question of public import with which we have to deal is the attitude of the public toward the industry as expressed by public opinion. The importance of a favorable public opinion toward the industry must be indelibly impressed upon the minds of every one of its employees.

#### ALL INTERESTS ARE IDENTICAL

The interests of the industry and the public are identical; namely, the best possible service at the lowest rate consistent with a high credit standing, for without the latter the industry cannot attract at low cost the money necessary to provide more service to meet the public demands.

The industry has invested in it today something more than five billions of dollars. It is estimated that during 1923 this will be increased to six billion dollars. If the present rate of growth of our sales of electric light and power continues, there will be invested in the industry in 1930, in order to take care of the business then, not less than fifteen billion dollars.

Therefore, we will have to raise for the next six calendar years an average of a billion and a half dollars per year.

The success we have had in inducing our customers themselves to become owners in our properties is of the greatest importance in the development of our industry and has materially increased the stability of the financial structures of the properties interested.

Companies selling preferred stocks to their customers should so plan that the proper proportion between the two classes of stock is maintained, so that the preferred dividend is earned at least one and one-half times.

#### SOLUTION OF COAL PROBLEM NECESSARY

The creation of a national commission fully empowered to get to the bottom of the troubles in the coal mining industry is the first serious attempt toward a solution of one of the most vital problems with which our industry has to contend. We have been disappointed that the cost of coal did not follow the downward trend of prices generally. The prices not only have been higher, but many of our operating companies have had to import large quantities of coal from England because of the curtailment of the American supply. Fortunately we have been able to introduce operating economies in our steam stations, and through a maximum use of equipment and facilities have overcome the handicap of higher-priced coal, and have given our customers service at the same, or at lower, rates. Statis-

*Abstract of report of public policy committee of N. E. L. A. delivered in New York, June 7, 1923.

tics gathered by the U. S. Bureau of Labor reveal the fact that during the past five years the average rate for electric service in every community from which the government obtains its data is less than the rate charged in 1914. This is in spite of the fact that the average monthly price of bituminous coal at the mine has increased from $1.14 a ton in 1914 to $4.36 a ton in January of this year. Nor does this tell the whole story; for increased freight rates on coal from mine to destination have added considerably to the cost of central station fuel.

It is hoped that some way of checking these ever recurrent strikes in the coal mining industry and in the transportation industry will be found by the constituted authorities without experimenting with government ownership of coal mines and railroads.

The development of large electric generating stations, serving wide areas, embracing many towns and communities, has very largely eliminated the local town plant and with it the question of municipal ownership. On the other hand, this very development and the next development of the interconnection of these systems by which one or more states may be served from one superpower system are given an opportunity for the advocates of state and government ownership to voice their ideas.

If it is at all possible to convert these unbelievers in private ownership and operation by furnishing infallible proofs of our competent initiative and efficiency, by all means let us do so.

### Water Power Development

The filing of a suit by New York State in the United States Supreme Court questioning the constitutionality of the water power act had the effect of retarding additional water power development and probably will continue to do so until the case is finally decided by the court. Notwithstanding this, more water power developments are under construction at the present time than at any other time in the nation's history.

While not all of the applications for water power permits are capable of immediate development, at least $750,000,000 is involved in projects now under permit.

There is a great deal which may be done in the hydroelectric field particularly in the direction of co-ordinating the operations of hydro-electric and steam central stations. Much more time may also profitably be spent in surveying and studying the hydro-electric resources of the several states.

It is our firm conviction that this work should be done by the electric light and power industry. Surveys of this kind have already been made by the industry in the Southern Appalachian region, in the Adirondack region, in the Pacific Northwest, and the Great Lake states. Similar surveys should cover the entire country, however, and the work of the numerous committees should be co-ordinated into a national survey.

### Rural Service Problem

Your association has gone into the matter of rural service this year more intimately than ever before, and many of its committees have been in close touch with farmers' organizations and worked in co-operation with them. Obviously, if people leave the farm those who remain must utilize more and more machinery, if the nation's output of foodstuffs is to keep pace with the rapidly growing population and the demands of other sections of the world for grain. The electric industry realizes its obligation to aid the farmer and stands willing to supply him with service whenever and wherever it is economical and feasible to do so.

There is no denying the fact that complete electric service on the farm brings with it great advantages, and as the systems of distribution spread out, more and more farms will come within the range of economic service. No engineering difficulties stand in the way. Every farm in the country could be reached, but in the present state of the art the cost of doing so would be so great that the rates which the farmer would have to pay for the service would be prohibitive.

In addition to the work which is now being done by our committees in co-operation with those representing farm organizations toward improving farm machinery, our engineers might also make a study of the situation with a view to determining the possibility of devising some less costly way of tapping high-tension transmission lines without jeopardizing the service on the rest of the system. While we want to do everything possible to improve service in rural communities and extend our lines to the individual farmer, we must be careful that overenthusiasm on our part does not raise in the breast of the farmer any false hopes with regard to electrical supply.

### State Regulation

While commission regulation of public utilities may be said to be in a state of flux, out of the wealth of opinions and decisions handed down by courts and commissions may be gleaned certain definite facts. The right of the state, within constitutional limitations and in the exercise of its police powers, to fix rates and regulate the character of public service is beyond question. Time and experience have shown that electric public utilities are absolutely essential and that good and adequate service at reasonable rates is a matter of first importance to the community.

The business in which we are engaged calls for a high degree of technical skill and experience coupled with practical business knowledge and practical understanding of the law of economics. To bestow the full benefits of our specialized knowledge on the community we need its moral and financial support. The public service commissions are an aid to this end. They act as impartial judges of our acts, pass on our service and, in a sense, vouch for the integrity of our securities. This being the case we should insist on commissioners of high caliber and then assist them by doing all we can toward their being supported by a sound public opinion. With commissions composed of men of this type our future is safe. Their decisions will be based not on prejudice but on reason born of their study and education in our industry with its resultant understanding.

### Co-operative Effort Necessary

The National Public Relations Section's work covers co-operation with educational institutions toward the establishments of courses in utility administration; the education of our men and women employees in the fundamental problems of our industry and a proper understanding of its interrelation with the public; the organization of public utility information committees in the various states; the establishment of speakers' bureaus in the geographic divisions; a closer co-operation between our association and the different classes of financial institutions; the development of good will

advertising toward the industry by the manufacturers and the compilation of a proposed uniform regulatory law.

It is regrettable, however, that one of the greatest difficulties that this section has had to contend with is the apparent indifference of some of the operators to the very important work which the section is doing.

Your association, your public policy committee, your Public Relations Section cannot by themselves make for the industry the necessary impression on public opinion. They can only blaze the way. The individuals of the industry must make and keep that way permanent. This cannot be accomplished without the interest and enthusiasm of the executives themselves. It is their duty to see that the importance of a favorable local attitude toward their particular companies and a sympathetic national public opinion toward the industry are appreciated and fostered by every member of their organization.

In companies large enough to support them there should be one official who should give all his time and efforts to this work. In the smaller companies the executive must do it himself. In every company it must be done.

As a general proposition, the public is fair in its conclusions, provided it has the data and facts on which properly to base those conclusions. Let us be more alive to our duty by seeing that these facts are common knowledge. Let us bring to the public a realization of the fact that it really has the greatest interest in the success of the electric light and power industry. We have nothing to hide.

We are engaged in supplying a great essential service that is doing as much as, if not more than, any other agency in the development of the nation. What our industry has achieved in the past, though much, is small compared with what it can achieve in the future with the aid of an enlightened and favorable public opinion based upon mutual trust and upon mutual and comprehensive understanding.

# Power Plant Practices Undergoing Change

***Prime Movers Committee Finds That Higher Pressures, Stage Bleeding, Reheating During Expansion, Air Preheating, De-aeration, Powdered Fuel and Diesel Engines Figure Most in New Activities***

IN GENERAL, the central-station industry is now actively considering higher pressures and temperatures, stage heating of feed water and reheating during expansion. Some companies are installing equipment of types considered quite distant not many months ago. However, many problems still remain unsolved, and there is a diversity of opinion with respect to the proper and best methods of utilizing higher pressures and temperatures.

Plants are now being considered with operating pressures from 400 lb. up to 550 lb. at the boiler. In one case boilers are being provided for 650-lb. pressure, but the turbines will be operated at 550 lb. The steam temperatures adopted in these plants range from 650 deg. to 750 deg. F.

According to information received by the prime movers committee of the N. E. L. A., of which C. F. Hirshfeld is chairman, many engineers feel that the adoption of pressures as high as 550 lb. at the present time represents too long a step into the unknown and that the advance to such pressures should be made slowly and conservatively. On the other hand, they agree that it would certainly be an error in judgment to adopt 200 lb. or 250 lb. for new work without giving thorough consideration to the possibilities latent in higher pressures.

The effect upon pressure loss of the design of piping, and particularly the design of valves and fittings, should have serious consideration before final decision. Instances are on record in which slight modifications in such parts reduced loss through them to values between one-tenth and one-half of those previously considered normal.

The increasing use of high-temperature steam has served to focus attention on steam-pipe insulating covering. Practice differs greatly, as all of the materials sold for this work seem to be in extensive use. However, 85 per cent magnesia is still the predominant material.

Expansion bends or offsets seem to be in almost universal use for high-pressure lines. These are reported as giving entire satisfaction except for leakage at flange joints in some cases, but this trouble appears to be the result of improper design rather than an inherent weakness of this type of joint.

### Ash and Coal Handling Practice

Statistical data on methods of handling coal and ash have been compiled from forty-one representative central stations. Of these, thirty-six received coal by direct railroad shipment and thirteen by water. Seasonal outdoor storage is provided at eighteen out of forty-one plants. Several mine-mouth plants are included in the eighteen. At twenty-eight plants locomotive cranes are provided for unloading or handling coal, while sixteen report bridge-crane facilities. Fifteen of the plants dump ashes direct into cars, while only seven dump direct into conveyors. The ash is transported from the plants by railroad cars in ten cases, and in ten others it is disposed of by dumping into hollows for grading, being transported by trucks, industrial cars, aërial trams and hydraulic sluices. In four cases the ash is disposed of by transportation in barges.

The trend is more and more toward the use of motor-driven auxiliaries, with in most cases some arrangement for insuring a continuous supply of power to those auxiliaries commonly classified as essential. The proper control of motor-driven boiler-feed pumps is causing a number of operators some concern. Numerous curves are embodied in the report of the prime movers committee, showing the variations in thermal performance resulting from different bleeder and auxiliary arrangements with and without economizers. The economical

TABLE I—SUMMARY OF OPERATING RECORD OF SEVENTY-FOUR TURBINE UNITS (1922)

| | | Percentage of Period-Hours |

feed-water temperature when economizers are used with stage heating appears to be higher than one would expect from experience in the older type of plants. The increasing use of deaërating equipment makes it necessary to consider the effects which such devices may have on heat balance.

Experience reported by a number of companies indicates that jet condensers can be used as heaters and at the same time operated so as to hold the oxygen concentration to values between 0.10 cu.cm. and 0.25 cu.cm. per liter. When very low oxygen concentration is desired, the concentrate and feed water must be handled in such a way that contact with the air is virtually eliminated. This may be done by maintaining a completely closed system except for a steam-sealed surge tank.

The closed heater has been used extensively for the higher temperature ranges. It is now coming into use for bleeder heater, as it offers decided advantages for such work. If provision is made for draining off condensate as rapidly as it forms, bleeder lines can be connected directly with the interior of heaters without check or non-return valves.

Some designers are now providing for the recovery in the condensate of heat in generator cooling air, in turbine lubricating oil and in transformer oil. The effect of make-up evaporators on heat balance is considered at length in the report, and numerous methods of connecting such evaporators into the system are given, together with indications of the effect on heat balance.

Close co-operation between manufacturers and users of turbines has resulted in considerable improvement in ability to meet severe requirements as to continuity of service and in gradual elimination of many of the minor defects which have been experienced in the past. Performance records of seventy-four large turbine units installed in twenty-seven power houses are given in the report for the year 1922. The outages of these machines have been analyzed very completely and classified according to power.

### General Use of Bleeder Steam

The very general use of bleeder heating of feed water in two or more stages is one of the notable movements of the year. The construction of a turbine to operate with steam at a pressure of 1,000 lb. to 1,200 lb. and to exhaust through a preheater into the high-pressure mains of an existing station is another development of the past year.

Control of the quantity of circulating water and various methods for effecting such control are discussed. It is shown that the use of two constant-speed pumps is only a partial solution in most cases and that variable-speed pumps make possible more economical control. The results of tests are included. The maximum permissible siphon is discussed, and records are given showing that one installation operates satisfactorily with a siphon of 32.5 ft. of water. Experience seems to indicate the desirability of a separate tank for hurling water with proper provision for cooling and make-up as the safest arrangement. Two cases are reported in which salt water used in hurling water has found its way into the condensate and ultimately into the boilers.

Rolling in condenser tubes at one end is considered entirely satisfactory by several companies, but others claim that it requires more time than it does to pack tubes in the ordinary way. Besides, the tubes have a very short life, and the removal of a tube is a more difficult job. The committee declares that it would be highly desirable that the users of condenser tubes should agree upon a single satisfactory specification for Admiralty metal tubes; tentative specifications have been prepared by the American Society for Testing Materials.

The first preheater is being installed in this country. It is designed to raise the air temperature 100 deg. F. at maximum load at the expense of heat contained in the flue gases leaving the economizer.

A study of arches over chain-grate stokers shows that no general agreement on details of design, size, shape, location, etc., is yet possible. Available life seems to vary from a few weeks to periods longer than one year, and in one instance a life varying between one week and five years is reported for arches of supposedly the same construction, operating in the same plant under what are supposed to be like conditions. Numerous methods of protecting side walls by air cooling and water cooling are being used; in a few cases the arch and its supporting metal are being cooled by air.

A number of plants are using stoker regulators with entirely successful results.

The increasing use of inclined baffles in horizontal

TABLE II—RESULTS OF OPERATION OF DIESEL ENGINES
(Data for three-year period ended Dec. 31, 1922)

| STATION | A | B | C | D | E |
|---|---|---|---|---|---|
| Number, Size and Kind of Diesel Units | Three 500-Hp. M. & S. Diesels | Four 225-Hp. B. & S. Diesels One 500-Hp. M. & S. Diesels* One 250-Hp. Primm Semi-Diesel† | Three 225-Hp. B. & S. | Labor cost per kw.-hr. output, mills | 2.17 | 4.40 | 5.27 | 3.65 | 2.43 |
| Production cost per kw.-hr. output, mills | 10.442 | 20.45 | 23.361 | 19.829 | 13.246 |
| Number of employees (average) | 6 | 7 | 3 | 5 | 3 |

*Installed 1922. † Not used since 1920. ‡ Increased due to new unit.
Note.—The Diesel engines at the stations represented in the above tabulation vary in age from eight to seventeen years. All of these engines have been giving continual service with the exception of the time lost for regular maintenance and repair periods.

tubular boilers has stimulated development of many different varieties. Baffles of the monolithic variety and baffles consisting of monolithic material reinforced with tile have given trouble in some cases. The indications are that the use of Portland cement makes them more resistant to shock and does not reduce the refractory qualities to an undesirable extent.

The experiences of one company in protecting and repairing furnace walls by means of a cement gun indicate that the life of such walls can be greatly increased at very small cost.

Results obtained by various methods of treating feed water have been obtained from thirty-six operating companies, and these are tabulated in the committee's report for ready reference. In general, each company has been favorable to the method used, indicating that the conditions have been improved by the treatment adopted.

### Deaërators Stop Corrosion

Results of tests made on one installation of deaërators indicate that with condensate leaving the main condensers with zero oxygen contents the water drawn from open heaters at temperatures in the neighborhood of 180 deg. F. contains 0.75 cu.cm. to 1.4 cu.cm. of oxygen per liter. This material leaves the deaërators at temperatures about 10 deg. lower and contains no oxygen. In this plant the use of deaërators has stopped corrosion of steel-tube economizers, which was previously very rapid and serious.

General satisfaction is expressed with the use of evaporators for preparing make-up water. Attention is called to the fact that leaky condensers may largely vitiate the results otherwise obtainable. When the make-up water contains corrosive elements it may be necessary to treat it chemically before admitting it to the evaporators.

Very satisfactory results have been obtained by two companies with the Permutit system. One company reduced its tube replacement expense from \$2,600 a year to zero and reduced the boiler-cleaning expense to one-third of its former value.

Tentative specifications for coal are presented by the committee this year. These have been drafted with the idea of making them practical—that is, protective to the purchaser and still acceptable to the producer.

Many trial installations of pulverized-fuel firing have been made during the past year. This method of firing has been adopted by several large plants now being designed or under construction. Much experience remains to be obtained in fuel preparation and transportation, as well as in actual combustion. The present tendency is toward the installation of radiant-type superheaters for powdered fuel furnaces, arranging them in series with the convection superheaters already installed.

As the result of elaborate tests, the Stirling boilers have been modified in the arrangement of heating surface and baffling so as to give reduced flue-gas temperature. This design makes it possible to obtain a greater amount of heating surface within given column centers than with the older design.

Of 500 feed-water regulators reported on, 85 per cent are said to be reliable.

Statements received from two plants, one using integral economizers and the other steel-tube economizers above the boiler, indicate that the feed water must be virtually free from dissolved oxygen if internal corrosion is to be prevented.

### Mechanical Oil Burners Not Fully Appraised

Experiments are still being made with oil burners of different kinds with different furnace arrangements. The important features appear to be furnace volume and method of introducing air. Existing burners of the steam-atomizing type have a working range from 40 per cent to about 250 per cent of boiler rating, so that burners must be cut out to carry less than 40 per cent load. Greater flexibility is desirable. Mechanical burners are not yet fully appraised, but they possess recognized advantages with respect to efficiency and maintenance.

Brief accounts are given of one case in which refinery residue is burned successfully and of another in which undehydrated oil gas tar is being used. Research is still very active concerning the distillation products of coal, and semi-commercial trial of different processes continues.

Owing to the catalytic action of certain babbitts on lubricating oil, care should be used in the selection of the babbitt. Of the two forms of sludge formed, one can be removed with relative ease, whereas the other is very difficult of removal. Despite extensive development of oil-purifying equipment of various sorts, there is yet no completely successful device.

Attention is called to the fact that it is better to install too few instruments than to install more than can properly be taken care of and used to advantage. Consequently, the committee has listed the boiler-room and turbine-room instruments which it considers are essential and in the order of importance or preference.

Gas engines of 200 hp. and under are extensively used in the smaller stations in which limited capital favors the lower first costs in comparison with Diesel engines. When such limitations do not exist and when a reliable and uniform supply of cheap gas is not available, the

Diesel engine is more often used because of its greater economy. Actual operating costs are given for gas-engine and Diesel-engine plants. Figures are also given to show installed costs on a kilowatt capacity basis. Attention is called to the extreme importance of proper maintenance in the case of Diesel engines and to the fallacy of predicating operating costs upon periods which are not of sufficient length to span a complete cycle of maintenance. The committee pointed out in its report that there is apparently a very marked tendency toward the increased use of Diesel engines, not only in the small plants but also in plants of considerable total capacity, consisting of units of relatively large size.

# Customer Ownership a Safeguard Against Communism

***Britton, Egan, Hall and Forbes Champion Cultivation of Human Relationship in Utility Operation and Development***

A SYMPOSIUM notable in the annals of the association was held upon customer ownership at the Thursday session of the committee of that name. John A. Britton, vice-president Pacific Gas & Electric Company, San Francisco; B. C. Forbes, editor *Forbes Magazine*, New York; E. K. Hall, vice-president American Telephone & Telegraph Company, New York, and Louis H. Egan, president Union Electric Light & Power Company, St. Louis, Mo., addressed a large and enthusiastic audience upon the development and prospects of customer and employee ownership, emphasizing the opportunities now before the industry in this field. Abstracts of these addresses follow.

## Customer Ownership Spells Salvation of the Industry

By JOHN A. BRITTON

Vice-President Pacific Gas & Electric Company, San Francisco, Cal.

TODAY the United States is facing a menace through radicalism and all the other isms to which a nation like ours is heir, a menace greater in my judgment than a cruel war. Through insidious propaganda the public is being taught to have no respect for private property, whether owned individually or whether in the hands of corporations. The more you get that man or that woman to hold the little slip of paper that represents a certain interest in your affairs, and the more he knows that the protection of that slip of paper means the safeguarding of property and income to him, the greater seed you are sowing. Involved in this is the welfare of this great and glorious country of ours that must be preserved along the lines upon which our forefathers built and which no one must be allowed to tear down.

On June 1, 1914, a circular was sent out by the Pacific Gas & Electric Company asking employees to participate in the purchase of preferred stock about to be offered on the market. There was a very ready response. That was the first date in the United States that any public service corporation offered its holdings of stock to its employees or to the public. Within a month an offering was made to the public, and we have continued ever since and very successfully. In 1922 our sales were more than $10,000,000 of preferred stock, sold over our counter without much effort, without any sales organization, and generally through the spirit of our employees, who became, unconsciously perhaps, the salesmen of our preferred stock, because they had up to that time imbibed the spirit that was abroad in the land that they should be partners through investments in the enterprises for which they worked.

I think down deep in the heart of every man and woman in the United States, whether he or she be of foreign birth or otherwise, lies dormant that love of possessing something, else we would not be, as we are, a nation of home owners. It is only a step from the desire to own a home to an investment that will insure the protection of those near and dear to you. That underlying sentiment needs only to be awakened by a general popular knowledge that the investment they are going to make is sound and desirable. It appeals with more than ordinary force if it is of local character.

In the early years before regulation, company after company in this country paid for extensions out of the profits arising from their rates. Unfortunately that payment out of earnings by the maintenance of high rates has kept us in boiling hot water. If the men in the industry at that time had had common sense enough to have pursued the method of financing that is pursued today, and if a part at least of that surplus earning devoted to the extensions of capital had been devoted to the reduction of rates, less would be heard today of the odium that still, I am sorry to say, attaches to some of the public service corporations.

Then the companies got into the hands of speculators, more or less, and then that narrowed down to certain circles of control, and we were facing a very serious era in public service corporation work such as ours before this consumer ownership came into being. The general sentiment of the press throughout the United States was decidedly against public service corporations and their policies.

Now you are leading up to more perfect and positive public relations. I don't care whether a consumer of yours is a stockholder or not, if the treatment of him by the employees of the company is not 100 per cent perfect, he disregards his small holdings of stock, and becomes not a booster but an opponent of the company.

I realize fully as well as any man here what it means to have back of you, however, an army of stockholders who have become imbued with the policies of your company and with the fact that it is the part of every

one having an ownership in the company to stand behind the protection of private property.

Let me tell you what it means to have those stockholders who believe in that preservation of private property as well as the nation as a whole. We did have in 1922 a war in California against that type and kind of destructive work that would tear down anything builded in honor and on principle. We had a fight there, and if they had won out, it would have threatened with destruction every public utility throughout the United States—would have toppled from its foundations the edifice that we men in the industry have been building up for more than a century.

That was the menace of that water and power act. Had California put its stamp of approval upon state-wide ownership, it would have crept on its insidious and slimy way all over this great nation of ours, and I think we of California did the nation a service. We didn't fight the battle alone. We don't take that credit to ourselves. The N. E. L. A., I am glad to say, under its great leadership, was of inestimable benefit to us in the accomplishment of our purpose to keep our state clean from those sorts of reptiles.

How did we do it? We had in all the public service corporations of that state not less than 100,000 stockholders.

SEVEN VOTERS PER STOCKHOLDER

There were at least 400,000 citizens of the state of California who went to the polls that day and voted against the proposition and, aided and abetted by others who on general principles were opposed to it, we rolled up a vote there of nearly 700,000 against to a little over 200,000 in its favor.

However, while we put our foot on the neck of that dragon for the time, he still spits fire. He is still alive. He has more lives than the proverbial cat and we have to face him again and his cohorts in 1924, but strengthened by that vote, strengthened by the increase in consumer ownership, I feel certain that the result will be better for us than it was last year.

We in California were pioneers again on massed stockholders' meetings and I commend our policy in this respect to every executive. We determined that we had a message for our stockholders, as we saw their numbers grow in importance and influence in the communities. Incidentally it is a big mistake for men in the public utility game, where state regulation is supposed to take care of them, to ignore entirely local conditions and influences, as unfortunately sometimes is the case.

We went out and organized stockholders' meetings at different points in our territory. The executives of the Pacific Gas & Electric Company traveled for nearly four months to the distant points of the system—and the Pacific Gas & Electric Company covers an area of 42,000 square miles. We went to the little hamlets of only three or four hundred people and to the cities of 500,000. We addressed something like twenty-five meetings and we gathered together between eight and ten thousand of our stockholders. We told them of our troubles, we told them of the part that they had to play in solving our troubles. We laid our cards on the table and told them what property they possessed and how it had been acquired and what it was worth to them. It was a good story. We illustrated it during the evening with moving pictures and lantern slides of the more prominent parts of our system.

I commend to you all to do that sort of thing. Go and see your stockholders and talk to them. Do not expect them to come in to your presence. There is a chilliness on the ordinary individual who comes in to our office. I venture to say that he does not know John A. Britton except as an imaginary person sitting behind a mahogany desk, clothed in awe and majesty, and that he has to go through four or five doors and send his card in and is received with ice-water glances and thrown out as soon as possible, and he hesitates to approach the executive.

I wish to Heaven, gentlemen, that the executives of the companies and their employees as well could be put upon the same plane of understanding upon what part they play with their consumers and the public as that of the grocery man who meets you smilingly at the counter and hands you out what you want.

After all, it is the human element. If I don't accomplish anything else this afternoon than to have put into the minds of you people here that you must in your attitude and conduct toward those you are serving treat them as you yourselves would like to be treated, I will be satisfied. It is only the Golden Rule. And if you do that, the mistakes that are around the morning sun of your success are going to fade away as sure as God made heaven and the earth.

ANNUAL REPORTS BY RADIO

W. E. Creed, president of the Pacific Gas & Electric Company, radioed out of San Francisco his annual message on the day of the annual meeting of the stockholders, listened to I don't know by how many thousands of people. I thought it a wonderful accomplishment. We know he was heard in Oregon, in Idaho, in Utah, in New Mexico, and all over California.

Again we called in our stockholders that night in every little hamlet and village, and where they didn't have a radio set we provided it for them; our division and district managers gathered them in to halls in sections in our territory, and there Mr. Creed's speech was delivered again to our stockholders and I think there were more than ten thousand in attendance.

All that I have said has tended toward the encouragement of consumer ownership. We must keep our house clean and as much above suspicion as was Caesar's wife. We owe it to ourselves, to this great industry of ours, and we owe it as well to that nation that we serve and that we are proud to serve!

## Opportunity and Responsibility of Customer Ownership

BY B. C. FORBES
Editor *Forbes Magazine*, New York

CUSTOMER ownership as a policy in the electric light and power industry can do more than any other branch of the management for the well-being and the prosperity of this nation.

Suppose we ask "What is the outlook in our own democracy, in our own commonwealth, in relation to this matter of getting ahead of the game?"

In one word, the outlook is very inspiring. In thrifty France the savings deposits of the people amount to less than one billion dollars. In frugal England the savings deposits amount to a billion and a half dollars; in our own country the savings deposits exceed eighteen and one-half billion dollars.

I gather that in the last eight years your companies

have attracted 425,000 customers alone as stockholders, and that you are confident that within three years you will have 1,000,000 customer partners.

When you consider that one electric company alone recently, through one offering of securities, was able to attract over 40,000 customers and 16,500 employees, then I think you ought to have no difficulty whatsoever in more than reaching this goal of 1,000,000 inside of three years.

I am interested in the customer ownership movement; I was sufficiently interested to put up through *Forbes Magazine* $1,000 in prizes for the best letters, the best articles on the benefits of customer ownership.

I think that, through the co-operation of you men in the industry, at least something has been accomplished to spread information and widen interest in this movement by means of this contest, for one thing. Over 2,000,000 lines of newspaper advertising have been published throughout the country in connection with this subject, this contest. Manuscripts poured in from every state in the Union and from all classes.

Next to being able to deliver the goods, the most powerful thing in this world is printers' ink. By that I mean letting the world know, being able to convince the world that you are able to deliver the right goods at the right price.

I think perhaps it might help your industry a little bit if we were to get together the first three or four prize winners in a little booklet and get them out at a purely nominal price per thousand, so that you could distribute them to the people in your territory.

### Customer Ownership Slogans

If I were to presume to offer one suggestion in connection with the furtherance of the customer ownership movement, one suggestion that might help to attract more buyers of your securities, it would be that you play up the home appeal, using such slogans as "Keep the saved dollar at home"; "Keep the dividends at home"; "Boom home trade"; "Boom the home community."

The simpler the arguments, the closer they come to the pocket, to the life of the ordinary people, the better.

Advantages and privileges always bring increased responsibilities. The growth of customer ownership means increased, seriously increased, responsibilities. If your organization hasn't already (and I don't know whether it has) some sort of viligance committee, I would suggest that it seriously consider appointing one, to look after, to keep an eye on the securities offered for customer and for public consumption. Nothing would more fatally hurt this whole important, vital movement than a few bad, a few unsafe, a few unworthy issues, widely distributed in local communities.

I do not know that it is necessary to mention it, but I believe that equally important with customer ownership is employee ownership. After all, the working classes can roll up more votes on election day than any other class in the whole country. It is, therefore, extremely important to earn co-operation and the loyalty and good will of your workers, through inducing them to become stock owners upon as generous terms as you can afford to provide. Then your worker feels that "I am not working simply for an impersonal corporation; I am working for the benefit not only of myself but my next-door stock-owning neighbor, my stock-owning friends and the whole community."

He feels that he has risen to a new stature in the scheme of things. I believe that whether we are going to drift, to move toward state and municipal ownership of public utilities, will be determined very largely, if not wholly, by how this dual movement of employee ownership and customer ownership succeeds or fails.

If you prove that you have ability enough to develop this movement wisely and broadly, then I believe that when the test comes the results will usually, if not always, be very much the same as the result was out in California last November, when by an overwhelming majority the people there voted against state ownership of the hydro-electric companies.

### A Nation of Investors

I would ask all you executives to feel that you are playing an infinitely larger part in the scheme of things than merely being out to make money for yourselves and money for your companies, important and vital though that is. Through customer and employee ownership, you have the opportunity and the responsibility of doing something valuable to transform America into a nation of investors. If you succeed in a large way in transforming America into a nation of investors, you will thereby succeed in bringing about a happier, a more contented, a more prosperous people.

---

## Capitalizing Owner-Customer Contacts

By E. K. Hall
Vice-President American Telephone & Telegraph Company, New York

I HOPE that in this customer-ownership proposition all of us in the utility business will not feel that our work is done when our customers have become stockholders. If we will all use that contact as an opportunity to follow that up with information about the business, about the problems of the business and about the principles of public utilities as related to the general public and to government, it will help a great deal.

### Public Understanding Needed

The one thing we need more than any other one thing is to have the public understand what we are trying to do for them, that we have no other job on earth but to furnish them service, and to set up a relationship with them so that they will be free to let us know just how they want that service. If all the utilities can get on that basis with the public it is going to be a whole lot better for us and infinitely better for the public themselves.

If we are going to interpret this public utility business to the public, then it has got to be done, not by the management, not by a few people at the top, but by the whole outfit. They have got to know the principles and the policies. They are the ones who can bring the public to a sympathetic understanding with the utilities as we executives never can begin to do.

This whole thing anyway, as we see it, is nothing but an attitude of mind. What is the attitude of mind of a given man toward a public utility company? Does he think that the public utility company is in business simply to make a lot of money? If that is his attitude of mind, he has it all wrong. The public utility man can't make a lot of money. The public utility is limited to a

fair return on the money that has gone into the business. That is all we can make. Until somebody changes the attitude of mind of that particular person, he has never got us right and we are never going to get him right. We can't get along right with him while he thinks in that way.

It is exactly the same way with the gang that is doing the job in the field. What is their attitude toward the company they are working for? Do they consider it simply a sort of an unknown organization to them where they come once a week and get their pay check, or do they really realize what it is—a great big combination of capital and muscle and brains and pep that are welded together in a big organization to give the public what it is absolutely essential for it to have—public service?

If the gang, if the crew in the field are a part of it, if they feel they "really belong," if they feel they have an opportunity to talk these things over and learn something about the policies of the company and the financing of the company and have a stake in keeping the company sound and successful, they can interpret the company infinitely better than they can if they don't have this feeling.

We don't need to argue that customer ownership is one of the best things that has ever happened to the public utility, not only in financial set-ups, but in their spirit toward the whole job; but here is the thing that perhaps we do not always keep in mind and perhaps we have not given enough thought to, and that is that never is any public utility going to go before the small investors of the country and sell them poor securities. Mr. Forbes said a good many wise things, but he didn't say any wiser thing than, that just a few issues of bad public utility securities are going to hurt us all and make the small investor lose confidence in the whole proposition.

### Sound Securities Aid Public Welfare

But assuming that every one of us will see to it that nothing but gilt-edge, first-class securities is sold to the small investors, then we are rendering, besides helping ourselves as we see it, a great service to the individual who buys our good securities. Probably 50 per cent of all the inhabitants of the United States have no idea today how to invest money, and very little opportunity to invest money.

In Texas we found a pretty good-sized town which would have to go further than from New York to Chicago to get to a first-class investment brokerage concern. Of course, the answer is, "Why, they can always go to their local banks." But they are bank-shy. It is very different for a citizen of such a community to come and talk with the people in his own town, his own public utility people.

### Losses to Frauds Could Nearly Finance Utilities

The Better Business Organization made an estimate not long ago that $700,000,000 a year in the United States was turned over to fraudulent promoters. It would not take very much more than that to keep building the public utilities of the United States, their extensions for more or less of an indefinite time in the future. If the money of the people who are being buncoed, whose money is being stolen from them, could be turned into public utilities, which, under government regulation, are the soundest securities next to government securities, practically, in the country, we would be doing the individual investor a tremendous favor and a great good.

We must be absolutely sure that no public utility securities that aren't good are sold to investors. It would be a bad thing for the social order in this country of ours if we destroyed the confidence of the small investor. If this first little experiment in saving and investing turns out wrong, he will lose confidence in the whole plan.

All taxes increased tremendously during and since the war and with no indication of a let-up. That means just one thing, that the source of supply for capital, for building and extending these public utilities is, to quite a large extent and to a very serious extent, impaired and yet the demand for the growth of the utilities is bigger than ever.

### Selling to Society in Cross-Section

Business is good. We have a prosperous country. The national income is about $60,000,000,000. Sixty per cent of that goes to people of less than $2,000 a year income, and 52 per cent of it goes to the wage earners. Those are the people who are going to buy these public utility stocks in customer ownership. It is not going to the rich people, not to the big investment concerns, but it is going to a cross-section of society which is the best place to have these things owned.

A list of the people who came in partnership with one of our companies recently in one of these customer-ownership stock distributions included lawyers, teachers, clergymen, government employees, newspaper men, manufacturers, bankers, barbers, blacksmiths, boilermakers, butchers, carpenters, chauffeurs, cooks, mechanics, firemen, waiters, shoemakers, housemaids, housewives, farmers. Housewives were at the head of the list.

We have a much stronger situation already in the distribution of wealth and saving in this country than abroad, but we should not be satisfied with what we have got. I mean the country should not. The more we can extend that, the safer this country is and the safer our institutions are.

All these countries in Europe are struggling along with poor public service. When they have poor public service they have not laid the foundation of sound, permanent and active business and industry. They have tried to develop it through government ownership. Through customer ownership we see what a wonderfully better thing we have! The whole people are going to own these utilities. In the next twenty years these securities are going to be even more widely distributed. That will bring about a better understanding between the public and the people, a very much safer situation for the country at large, infinitely better public service, and it will be better for the American nation as a whole.

If we carry out customer ownership intelligently and fairly, conservatively and soundly, we are guaranteeing the success in the future of these public utilities pretty nearly. We are doing a wonderful thing for the industry. We are doing a very much needed and very magnificent service to the individual investor, the small saver who wants to invest his money safely, and by distributing the ownership of all these great service companies throughout the country, we are doing the nation itself perhaps the greatest service that we can render to it.

## Broader Financing for Customer Ownership

By Louis H. Egan
President Union Electric Light & Power Company, St. Louis, Mo.

Of the $180,000,000 which has been sold during the past year and which is being exceeded this year, there has been $145,600,000 of it sold in the form of preferred stock. Why preferred stock? Going back to Mr. Hall's suggestion that the securities should be gilt-edged and first-class only that you sell to your customers, it is obvious that you can't sell bonds that way if you continue to sell them on the basis that you sold them in the past, namely, in large blocks as required.

If, however, you try to sell the common stock, you are getting very close to the point, unless your company is in a very satisfactory condition, unless it has a long record of dividend years on common stock, you are getting to the point where it is well to adopt something in between, so we came to preferred stock and started out on 7 per cent preferred stock because it was a convenient sum, it was about the return that we felt the stock should bring at that time.

Now, if we change that attitude, we must be careful in which direction we change it. As the business expands and as our securities become more and more secure, we will, of course, be able to sell common stocks with more assurance than we ever have before, but there are some difficulties about selling common stocks that are not inherent in the sale of preferred stock. The time is short, it is impossible to go into all of those, but they are there. It is not always as satisfactory, and yet if you are selling stock to customers and to others on the basis that you want them to work with you, when you are caught where the hair is short, then you ought to sell them common stock, and there is no question about it at all. That is the first stock that would feel any unfair advantage that might be taken of you. Your preferred stock would not be affected until some time thereafter, but your common would. That may be the next step as the business becomes more stable. The possibilities of it are crystallized in the minds of your purchasing public; it may be that the common stock is what you should sell.

### Ideal Security Set-Up

The ideal financial set-up of the public utility, as we view it today, is that approximately two-thirds of your investment is in the form of bonds and one-third of it is in the form of stock. If you want to get your money on the cheap basis, you probably divide your stock on the basis of one-sixth of it in common stock and one-sixth of it in preferred stock. How much money does each customer represent in your business? In your community it is approximately $300. Therefore, for each new customer that is coming into your business today it is necessary to provide $300 of investment. One-sixth of $300 is $50, and that is all the money that you will be able to get in the form of the sale of preferred stock, if you follow this very definite financial set-up that we are all more or less following today.

Now, on the basis of $50 to that customer, what chance have you of selling him in the future? In Missouri we have approximately $600 to each holder of our preferred stock. It has been very easy; all things considered, it has not been difficult at all. Six hundred dollars gives you a possibility if you maintain that ratio of only selling one in each twelve of your new customers. Is that difficult? Obviously not. Many of us have already reached that point, starting before the war and working up through these years when it was not easy always and when the government actually denied us the opportunity of selling, when 7 or even 8 per cent preferred stocks didn't have the very desirable ring that they have today.

We have then a comparatively easy future, if we are going to confine ourselves only to the sale of preferred stock, representing one-sixth of the investment that you have to provide for each customer. We look forward with confidence to our ability to do that. In fact, one of the reasons why the expanding companies in this industry have sold so much stock in the last few years is that they have so much to sell. We started from zero practically. We had had no past in that respect and so we have not only caught up but we are now exceeding the amount that is required, if we maintain this ratio of preferred, which is approximately what we are doing today.

We have worked up a selling force amounting to quite a considerable investment, not only the dollars and cents that we pay them, but the investment that we have made in educating them, just as you have in any employee, but even more than usual in the case of our securities salesman who came to you knowing nothing whatever probably about the business he was to undertake. Now, you have worked him up to the point where he knows all about your company, all about your future, as you have told it to him, all about your past as he has read it. He knows a great deal about the business, and yet when the month of May rolls around you are through for the year. It just won't do. You have got to sell something else. You have got the facilities to do it, you have got the clientele to sell it to, you have sold them what? Millions and millions of securities on which you have paid regularly dividends now for some years and with every prospect of a continuation of doing so.

### More Bonds Should Be Sold

Why shouldn't you sell him something that pays 5½ per cent, as well as 6 per cent or 7 per cent or 8 per cent, or some other per cent? It even comes back to Mr. Hall's idea that it approximates something first-class and gilt-edged. Why shouldn't you sell him some of your bonds? Right away you say: "Well, these have to be sold in buying lots and it is difficult to do it, and the bond people would probably object and the bankers would, too"—and so they would, but the bankers and those investment bankers and those who handle preferred stocks, when you undertook to sell your preferred stocks, predicted only failure.

You will find today that when you begin to talk about the sale of bonds the same answer will come back to you, and yet it can be done. It is done here in this report to the extent of a few million dollars a year but with, however, a minimum of effort in that respect. It can be done in Missouri today; we are doing it in a very quiet, modest way, just to try it out to see what the reception is that they get, to find out what the people say, so that we may study for the future and devise the best forms of sales that we can, covering that. I think that is what we are all coming to in time.

When we talk to customers and to commissions and to anybody else about our business we should adopt a happy attitude toward it. We should be proud of its past and confident of its future and that will help you

it sell securities as much as anything I know. There are possibilities in the sales of these securities that we don't dream of today. I am satisfied about that. Just the method by which we will accomplish that I am not so sure of, but let's be happy about it and confident about it, and every time we talk about it don't let us let out a bleat such as the railroads of this country do today. The public here, I am sure, is sick and tired of hearing every railroad man who speaks publicly groan and moan about the way he is oppressed. He may be oppressed, but I don't think it helps him any to talk so much about it.

# Renewal and Retirement Reserve

***Purpose and Effect of Property Requirements—Properly Maintained Utilities Do Not "Depreciate"—Questionable Value of Life Tables—Function of Commissions***

By Carl D. Jackson
Attorney-at-Law, Joint Counsellor for the National Electric Light Association and the American Gas Association
Formerly President of the National Association of Railway and Utilities Commissioners

THE question has been asked: "Has a depreciation reserve any other purpose than to provide a means of equalizing the effect of property retirements so that the disproportionate burden may not fall upon the operations of any one year?" The answer is in the words of Account 251 of the Uniform System of Accounts:

The losses which this account is intended to cover are those incident to important retirements of buildings; of large sections of continuous structure, like gas mains, or of definitely identifiable units of plant or equipment, and the object of the account is that the burden of such losses may be as nearly as is practicable equalized from year to year."

If the reserve is sufficient at all times to take care of the losses caused by retirements as they take place, it will accomplish the object stated if set up on a fairly uniform basis over a period of years, and it will accomplish the object of protecting the investment in the property; it will insure the property being kept in first-class operating condition and hence insure good service, the prime object of the utility, and it will bring about that stabilization of the financial structure of the utility upon which alone future adequate service can be predicated.

To those who say that a larger amount than that is necessary, the query must necessarily be: "What is the object of this excess amount and what right have you to demand this excess amount from the patrons whom you are serving?" To those who say that they have a right to levy an amount in excess of the amount necessary as above set forth, because no matter what that amount may be they are willing to credit to any reserve a stipulated interest, my answer is that "You have not got the right to make the patrons lend you this money on any such terms except through the issuance of securities or the recognition of a debt in terms of debt."

### Where Reserve Shall Be Provided

The National Association of Railway and Utilities Commissioners when it adopted the Uniform System of Classification of Accounts, as I understand it, substantially committed itself to the following propositions: That a reserve should be provided where practicable sufficient for the following purposes: (1) To take care of the cost of the retirements as they shall occur; in other words, that reserve shall be of sufficient amount so that it will, as near as practicable, insure the amount necessary to meet the costs of the retirements when and as they occur. (2) That it is desirable that the operating expense account shall not be unduly distorted from year to year by charges necessary for this reserve. In the words of the text of the account: "for this purpose shall be equalized as nearly as practicable."

If all these problems could so easily be solved by some simply worded mathematical formula and justice be done, both to the utility and the public, and the public interest be served thereby, there would be no objection to this being done that I know of. But when no such thing is practically possible there can be no greater mistake on the part of either the public or the utilities than to assume or admit the possibility of that which they know not to be possible or practicable.

Each utility should, so far as is practicable and possible, establish, either through operating expenses or through appropriations from surplus, a reserve for the purposes clearly stated in Account 251: that the reserve should be adequate for the purposes for which established. It may well contain a margin of safety in this respect assuring within reason its continuous adequacy, and it is to be preferred that the reserve should be, it seems to me, somewhat more than adequate rather than less than adequate.

### Only One Reserve Necessary

In order to simplify the precise matter under discussion, let us eliminate that branch of the mathematical theorists who would also go further and establish a separate reserve for each class or kind of property in the plant, and by all means, let us eliminate from this discussion further niceties sometimes put forth that at the time any unit of property is retired the so-called accrued depreciation on a life basis must be calculated and the capital accounts be determined by this calculation. I do not believe that there now exists among those who have closely studied the subject very much difference of opinion on the question of whether more than one reserve is necessary. Generally it is accepted that one reserve for all classes of property is all that is necessary. We, therefore, come down to the question of whether, leaving these other points out of the discussion, there is any adequate or reasonable basis for working out any general formula based on a prophecy or assignment of future lives.

Let us not overlook this fact to begin with: That not only have we got to calculate future lives, but it is

generally accepted that in determining the amount which will be necessary to meet the retirement costs we must deduct salvage value at the time of the retirement, and also provide for the cost of dismantling.

Let us also take into consideration the following: There is no property I assume, at least in the electric field, where every unit of property when it wears out or is retired is taken through the capital accounts. As expressed in Account 251, the practice of accounting for the cost of retirements relates to important retirements, to buildings, to large sections of continuous structures, definitely identifiable units of plant or equipment.

In estimating lives those committed to a general mathematical formula base that formula not only upon ordinary wear and tear, which is to be accurately estimated for the future, and which wear and tear will not be overcome by any maintenance or repair, but the lives must be based upon an accurate calculation of the losses or retirements which will result from incapacity for service, from obsolescence, from inadequacy, from supersession resulting from new inventions and discoveries, from changes of popular demand, and from the future requirements of public authority.

### Shortcomings of Life Tables

The idea is that such calculations have been possible in the past. It is my opinion that such calculations have never even approximated the lives for particular property in particular utilities. The manifest absurdity of doing some of the things which such a formula requires should upon little thought be sufficient to condemn it.

Professor Riggs, of Michigan University, in a few pages, has shown the impossibility of the whole matter in his recent book on "Depreciation of Public Utilities." He calls attention to the fact that the rail on the main line of a heavy traffic road may have a life of only two or three years while it may have a life of twenty years on another road. The life of buildings is generally determined by very many considerations having nothing whatsoever to do with the question of wear or decay. As he points out, one building may be in a city showing a 200 per cent increase of population in a decade, and may become inadequate in eight or ten years. In another city, it may last forty or fifty years before the requirements are such as to indicate its retirement.

Now, it is the experience of all of you that the abandonment of an electric power house or other operating unit of a large property will undoubtedly cause the retirement of hundreds of items which are far from ready for replacement; many, indeed, may be entirely new.

Furthermore, I think it must be your experience that in the electric industry many of the units ordinarily cared for through retirement reserve have required the use of that reserve not through wear and tear or inefficiency compared to its operating condition when new, but through the changed operating conditions that surround the locality and the industry and the art. It is beyond human ken to accurately forecast or use life tables on such a basis.

Is it not better, therefore, to face the facts as we all know them to be, rather than to build up some theoretical solution of a problem based on facts which do not exist and cannot be determined?

It does not follow that because a formula does not exist the question of an adequate or reasonable reserve cannot be determined from time to time and in such a manner as will protect all interests and assure an adequate plant and service. We must cease to think, however, in terms of generalities and confine ourselves to the individual utility and the individual situation. President McKinnon, of the United States Independent Telephone Association, in his letter of June 1, 1921, to the Interstate Commerce Commission, frankly stated the facts in terms equally applicable to the electric industry. He said:

"In dealing nationally with the question of depreciation as applied to telephone companies, we are at once met with the fact that conditions differ, not only in different states but in different parts of the same state, and between adjoining operating companies obsolescence varies according to the rapidity of growth and population. Hazards vary according to geographical location. Deterioration occurs rapidly or slowly according to climatic and soil conditions. It is at once apparent, therefore, that no answer can be given applying to the country as a whole, or by states or by companies when such companies have several exchange properties. In the ascertainment of a proper reserve for depreciation it seems therefore evident that companies must be considered individually rather than collectively or by groups."

When we come to exercise judgment in the individual case there are several factors which must be considered which give a reasonable approximation to the necessities of the situation. If the company is a large one with a considerable experience and its accounting system is in substantial accord with proper accounting practices, we have the history of retirements as casting considerable light on the situation, retirements as a whole rather than by classes of property. But we are not confined wholly to that past history. We have a present situation and the observable necessities certainly for the immediate future, and as to the individual company, a good deal of data throwing light upon future situations for perhaps a considerable period. Not only will the present condition of the property be taken into account, but the nature of the locality; any special risks or hazards; climatic conditions; wear and tear; the growth of the community, and the probable necessities which may arise within a reasonable and fairly observable time. The history of the company may show that a uniform credit to this reserve in the past indicates a reserve greater than necessary. On the other hand, circumstances immediately foreseeable may show the necessity for a larger reserve than the company has been setting aside.

I do not believe it possible to say that 5 per cent, 10 per cent, 15 per cent, 18 per cent or 20 per cent of investment should be the determining limit for a large class of companies operating under dissimilar conditions. Certainly a generalization could not be made for classes of companies throughout the country in the electric industry. And it must never be overlooked that under some circumstances and conditions a rather large percentage might be justified while in other cases a relatively small one could be shown to be adequate.

### Functions of Commissions

I do not wish to be understood as in any way advocating the abolition of the supervisory powers of the regulatory commissions over this matter. It is my belief that in the first instance and unless unusual conditions arise the utilities should themselves be permitted to exercise judgment; secondly, that where

the matter is brought into question the commissions investigate the matter; thirdly, that that power of supervision should be exercised in connection with the individual company or situation and not by any general theoretical formula. It is my belief that the tendency of regulation is not to substitute commission judgment for managerial judgment. Laws should not be passed compelling the exercise of managerial functions by commissioners. The exercise of the function by commissions in this respect recognized in the Uniform Classification of Accounts, it seems to me, is a discretion to be exercised only in the case of abuse by the corporate officers. This is in line with the decision in the Southwestern Bell Telephone Company case, recently handed down by the United States Supreme Court.

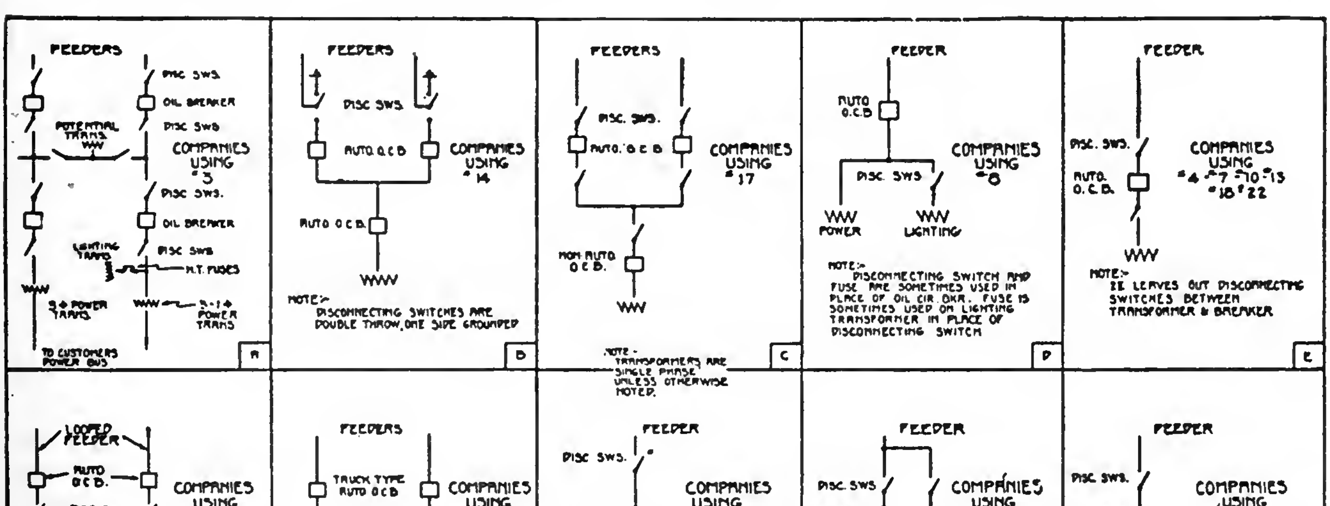
In case it becomes necessary for the commission to pass judgment in the matter of allowances or requirements for retirement reserve, if confined to the individual company or situation, the utility will have the opportunity of bringing forward all its own special circumstances relating to its own operation and plant, and the commission will have the benefit of as large a knowledge as possible of the requirements when it comes to pass upon the matter.

# Automatic Substations and Duty Cycle of Oil Circuit Breakers

***The Electrical Apparatus Committee Dwells on the Prevailing Practice in the Construction of Industrial Substations, Experiences with Automatic Substations, Agreement on the Duty Cycle of Oil Circuit Breakers and the Revision of Motor Rules***

ACCORDING to information obtained by the Electrical Apparatus Committee of the N. E. L. A. from thirty-four companies regarding industrial substation design, oil circuit breakers are used in most of the installations, with a strong tendency during the past ten years toward a much higher kva. rupturing capacity. The committee, whose report was presented before the New York convention this week by its chairman, R. H. Tapscott, said that four or five companies report installation in their own substations of reactors in all lines serving industrial customers and others only where they are necessary to keep the possible short-circuit current within the circuit-breaker rating. Two companies reported the use of non-automatic circuit breakers only in industrial substations, while two other companies use fuses instead of oil circuit breakers. In most cases oil circuit breakers are selected to interrupt the maximum calculated short-circuit current on the basis of manufactured rating. The practice of almost all companies reporting is to depend on hand operation of circuit breakers, only two or three providing for electric operaton.

Eleven companies regularly provide two incoming lines, seven looping in and out and four adding a second radial line when the character of the service warrants the expense. Of these eleven companies eight provide



CIRCUITS OF TYPICAL INDUSTRIAL SUBSTATIONS

automatic breakers for each transformer bank, while three depend on line circuit breakers in case of trouble. Seventeen companies regularly provide only one line into customers' substations.

In the construction of transformer vaults eight companies of fifteen provide substation ventilation by means of vents, louvers or flues, while three utilize windows. Six companies install oil circuit breakers in compartments, two employ truck-type breakers and five mount equipment on pipe frame or channel iron. All companies use single-phase transformers in banks of two or three units. Two companies use three-phase units to some extent.

### Reliable Service from Automatic Substations

The service rendered by automatic alternating-current substations has been reliable, and keen interest in this development is being shown by other central stations. The automatic control of street-lighting circuits is also increasing. Five companies report the use of time clocks only for control, one company reports remote control, another a complete automatic system, while a third uses the reclosing circuit-breaker method, controlling a group of "R. O." transformers in each station.

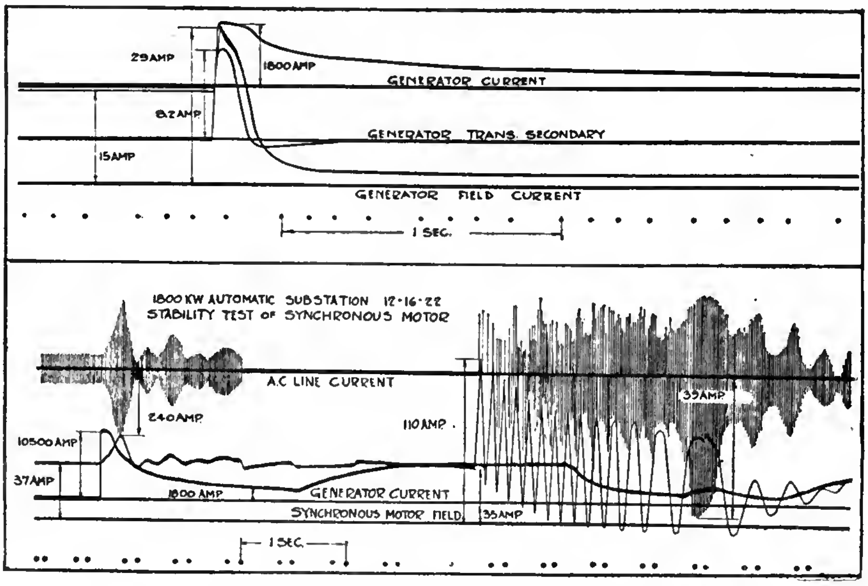
Truck-type breakers are coming more and more into use. Their advantage lies in the very simple connections between switch and bus, the elimination of disconnecting switches with their hazards and clumsiness, the small amount of labor required for installation, and ready interchangeability in case of trouble. At the present time breakers of this character are available for voltages up to 15,000, with rupturing capacity up to 20,000 amp.

Very convincing information regarding the reliability of automatic direct-current substations has been obtained during the past year in St. Louis and Cincinnati. With the 1,875-kw. motor-generator set of the Cincinnati substation in normal operation (rated load of 7,500 amp.), the alternating-current cable feeding this station was opened and reclosed after an interval of 4.56 seconds. The set continued to run on the direct-current side at reduced speed with the short-circuiting breaker across the differential series field open, thereby increasing the field strength of the generator and reducing the speed still further. By operation of the alternating-current relays the motor field was disconnected from the exciter and short-circuited, and the oil circuit breaker short-circuiting the starting reactors opened. When the alternating-current supply was again re-established the motor speeded up. When at 95 per cent normal speed the field was closed, and 15 cycles later the starting reactors were short-circuited. The conditions attending this operation were more severe than the ordinary alternating-current disturbance.

An additional test was made to determine the maximum torque of the synchronous motor while running as an induction motor. The alternating-current supply was opened, and with the generator tied to the Edison system full field was placed on the generator in order to reduce its speed as much as possible. With the generator motoring at 82½ per cent normal speed, the alternating-current supply was closed again. Within one second the generator was delivering 8,000 amp. at 268 volts. The total duration of induction-motor operation was ten seconds.

The generator normally operates as a shunt machine and the load is regulated by a contact-making voltmeter. When a gradual overload occurs the output of the machine is limited by the contact-making ammeter. In the case of sudden overload the contact-making voltmeter and ammeter both function to reduce the current on the machine, but a more rapid action is obtained by the opening of the short-circuit breaker across the differential series field, which limits the output of the machine to 9,000 amp. at zero voltage.

In a test in which a dead short circuit was thrown across the bus the generator current reached the maximum value of 59,700 amp. in four cycles. This overload current was reduced to rated value of machine (7,500 amp.) in one and a tenth seconds.



ACTION OF AUTOMATIC SYNCHRONOUS MOTOR-GENERATOR SET AT ST. LOUIS UNDER SHORT-CIRCUIT CONDITIONS

The 1,800-kw. synchronous motor-generator set of the St. Louis company was subjected to a momentary short circuit of 46,000 amp. and was in condition for continuous operation afterward. The short-circuit current was held to this value by the compensating pole-face winding. At this extreme overload there was only a very moderate momentary spit at the generator brushes. During the short circuit the voltage fell practically to zero.

To show motor stability the generator was loaded to approximately 125 per cent load and the high-tension feeder opened, allowing the generator speed to drop rapidly. After an interval of two and one-quarter seconds the feeder was reclosed. The highest fluctuation in the motor-field current was nearly three times normal. Three-quarters of a second after the feeder was reclosed the motor-slip relay reduced the generator load and the motor pulled quickly into synchronism.

Some companies are installing temperature indicators on all generators, some on new generators and some only on generators which show a relatively high temperature under ordinary operating conditions. A total of thirty-six have been installed to date, twenty-four for steam turbines and twelve for waterwheel units.

In practically all of the newer stations and those now under construction electric drive has been adopted for a very large proportion of the auxiliaries. Preference between a supply of energy from the main bus only and supply from a combination of house turbo-generator and house service transformers has shown a definite trend toward the latter, because of the advantage of independent sources of supply and adaptability to heat balance adjustment. The only outstanding new feature in this connection is the adoption of a direct-current shaft-driven auxiliary unit for supplying excitation and condenser auxiliaries or an alternating-current unit for supplying auxiliaries only.

Constant-speed alternating-current motors in generating stations are now being started by one of the following methods: (1) Individual starting compensators or auto-transformers; (2) starting bus; (3) through individual reactors; (4) directly across the line. In the Calumet station, Chicago, several motors up to 150 hp. are regularly started by connecting them directly across the line. The question has lately arisen whether the synchronous motor should not be used more largely by central stations to improve power factor.

Past experience with generator fires has shown the necessity of providing some permanently installed means of coping with this trouble, supplementing preventive means such as balanced differential relays, periodic insulation tests, etc. Only three of the companies which have installed such equipment have had experience in actual fire fighting, these fires all being extinguished by the use of steam. Test data on experiments with inert gas have been made by the Hartford and St. Louis companies, but neither company has had any experience with a fire.

Automatic control for waterwheel-driven generators is rapidly spreading throughout the country. This type of control has usually been installed with generators having a capacity between 200 kva. and 750 kva. However, a 5,000-kva. installation at Searsburg, Vt., has been so equipped recently, and an automatic station of the Peninsula Power Company in Wisconsin will have two 2,000-kva. units.

### Duty Cycle of Circuit Breakers Settled

A definition of circuit-breaker duty cycle has been agreed upon by the A. I. E. E. protective devices committee and the electrical apparatus committee of the N. E. L. A. as follows:

1. Interrupting rating is based upon the highest r.m.s. current at normal voltage at which oil circuit breaker can interrupt under the operating duty specified.
2. Operating duty shall consist of a definite number of unit-operating cycles at stated intervals.
3. Each unit operating cycle shall consist of closing the circuit breaker, followed immediately by the opening of the breaker.
4. The breaker shall perform its rated operating duty without emitting flame. The condition of the circuit breaker at the end of any operating duty within its rating shall be: (a) Inspection shall show the breaker to be substantially in the same mechanical condition as at the beginning. (b) Inspection shall show the main current-carrying parts of the circuit breaker to be in substantially the same condition as at the beginning. However, the interrupting ability of the circuit breaker may be materially reduced.

The foregoing operating duty is made on a two-shot basis. On any other basis the following factors shall be applied: (a) One interruption heavy-overload duty, 125 per cent; (b) two-interruption duty, with two-minute intervals between interruptions, 100 per cent; (c) four-interruption duty, with two-minute intervals between interruptions, 70 per cent; (d) four-interruption duty, with half-minute intervals between interruptions, 60 per cent; (e) four-interruption duty with no time delay between full open position and start of closing position, 30 per cent.

Several companies have installed equipment to provide communication over their high-tension transmission lines. In most cases it has been for simplex operation, although a duplex system is installed on the Duquesne Lighting Company's system. The operation of carrier-current apparatus is very satisfactory, and communication can be maintained through disturbances which would cripple the line telephone.

Several types of experimental relays have been developed to operate on carrier current, making possible the remote control of switches by means of impulses sent over the power lines.

At least two systems of complete remote supervision and control of distance switching over telephone lines have been developed and are being installed.

A joint committee of all interested organizations has agreed that the recommended standard voltage shall be that which will supply the proper average voltage to 115-volt lamps. One hundred and ten volts and 120 volts have been listed as recognized values, although the latter is discouraged for new systems.

As a whole, the use of single-phase transformers seems to be favored over three-phase, although there are several ardent supporters among the large companies for the latter, with sound arguments to back up their contention.

Regarding the effect of colors of transformer cases on temperatures, L. J. Moore and J. S. Moulton, San Joaquin Light & Power Corporation, advised the committee that gray paint will not reduce oil temperature more than 3 deg. to 4 deg. F. or 1 deg. to 2 deg. C. during extremely hot weather. They maintain that any expenditure to repaint black cases now in service would not be justified in any way.

Many companies report complete satisfaction with centrifugal oil separators; several say this method is slower than the blotter press, while others report using the centrifugal machine as a primary purifier and finishing up with one run through the blotter press.

Various opinions have been expressed regarding the features which should be incorporated in temperature indicators for distribution transformers. Among them are: (a) The device must be low in first cost and maintenance expense; (b) it must be compact, easily installed and readily visible from the ground; (c) it must be easily and quickly reset; (d) it must be positive and reliable; (e) it must be weatherproof.

Rules governing the installation and use of motors on central-station distribution circuits have been revised. Among the features were the incorporation of tables giving the allowable starting current for different-size motors with free and blocked rotor, also the full-load running current.

The recent rapid growth of transmission systems has produced a definite and increasing tendency toward the use of various types of voltage-regulating equipment, including tap-changing devices or ratio adjusters on transformers, induction regulators, step-type regulators, synchronous condensers and synchronous boosters. Of these the tap-changing device is coming into rapid favor. Several cases have been reported where large induction regulators are used for controlling the voltage at the end of the line or on the distribution buses.

For the purpose of promptly isolating an individual line feeding into an alternating-current network an automatic network protector has been developed.

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Power Plant Records.*—F. S. RUTLEDGE.—A systematic method of tabulating important data is essential to the efficient operation of a power plant. Several examples of what this means and how it may be readily accomplished are given.—*National Engineer*, May, 1923.

*The Cross-Flow Impulse Turbine.*—F. NAGLER.—Particulars regarding a type of waterwheel designed for use with high heads and called the cross-flow turbine are discussed. In this turbine jets make an angle greater than 45 deg. with tangent, the buckets are flattened with curvature less than 90 deg. and the bucket inlet is inclined forward. Aside from the advantages in speed, the author claims that the wheel automatically corrects one of the defects that contributed greatly to the failure of single-flow impulse turbine. This failure is the backing of water into the wheel, resulting in its being dragged around with the wheel and ultimately discharged at wheel velocity.—*Mechanical Engineering*, May, 1923.

## Generation, Control, Switching and Protection

*Lightning Arresters.*—H. YAGI.—A formula is derived which gives the magnitude of the series resistance of the horn arrester required for a given number of air gaps. The shunt resistance that would make the arc unstable is then determined. The discharge characteristics of an aluminum-cell arrested are also considered, and it is shown that the volt-ampere characteristic, which simply gives the relation between effective values, is entirely inadequate to cope with the discharge phenomena, which generally contain complicated and abrupt changes of instantaneous values. The possibilities of utilizing the static capacity of the cell arrester as a high-frequency absorber are pointed out. The author proposes for this purpose the use of a shorter air gap with series resistance and also a static condenser in parallel with the simple air gap hitherto employed.—*Journal of the Institute of Electrical Engineers of Japan*, April, 1923.

*Oil Circuit Breakers of High Interrupting Capacity.*—C. PALESTRINO.—This paper, presented before the recent meeting of electrical engineers in Turin, deals with the latest achievements, studies and developments available and suggests how the type and the interrupting capacity of a breaker must be chosen in order to meet the conditions of a given installation. In the first part of this paper the distance at which the rupture of the arc must take place, the number of contacts, the duration of the arc, the oil level in the tank, the pressure of the oil, the velocity of the arc rupture, the formation of gas bubbles, and so on, are fully treated in detail with formulas and diagrams. In the second part the calculation of the maximum interrupting capacity and a close study on the phenomena following short circuits can be found. A general survey of the American, German and French rules for constructing oil switches concludes a very interesting paper.—*Elettrotecnica*, March 25, 1923.

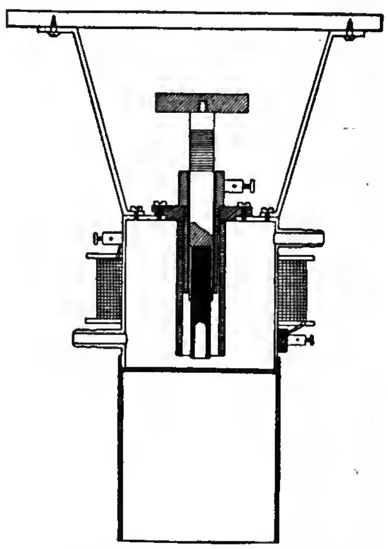
## Transmission, Substations and Distribution

*Heating of Cables Carrying Current.*—E. SACCHETTO.—The determination of the current intensities permissible in cables for transmission of electrical energy is still far from being on a practical working basis. The author makes some useful observations regarding the determination of the thermic resistivity of insulators and investigates the principles on which the tables, which give the maximum current capacity of buried cables of impregnated paper, were made.—*Elettrotecnica*, March 25, 1923.

*Cable Geometry and Calculation of Current-Carrying Capacity.* — D. M. SIMONS.—The main part of this paper deals with the errors in the standard formulas for calculating the thermal resistance and geometric properties between the conductors and the sheath. A graphical method of correcting the errors is obtained in terms of what is called the "geometric factor." The results are tabulated for two, three and four-conductor cables throughout the range of practical sizes. The check between the results of the graphical correction method and the published experimental data on this subject is very satisfactory and emphasizes the errors in the standard formulas. The thermal resistance between the sheath and the duct is mentioned briefly, and an appropriate method of finding the resistance between the duct and the region at base temperature is outlined. The previous work is then combined into a simple formula giving the allowable current for $n$-conductor cables, there being any number of similar cables in the duct bank. The formula is also enlarged to cover the case of cables in the metric and square-inch systems, and cables are buried directly in the ground. The method of including the effect of induced sheath currents in single-conductor cables and of dielectric losses is shown. Finally, the procedure to use in case the cables in the duct bank are not all of the same type is outlined. This paper is to be presented before the A. I. E. E. Convention at Swampscott in June.—*Journal of the A. I. E. E.*, May, 1923.

## Units, Measurements and Instruments

*Simple Poulsen Lamp.*—L. BERGMANN.—A very inexpensive and easily made Poulsen arc lamp is described, which gives, the author claims, undamped oscillations of remarkable regularity. This apparatus may be used for measuring or demonstration purposes where the relatively high cost and the limited life of a vacuum-type lamp are prohibitive factors. The arc is inclosed in a tight vessel through which illuminating gas is circulated and burns between a heavy carbon electrode



UNDAMPED OSCILLATIONS OF REMARKABLE REGULARITY CLAIMED FOR THIS POULSEN LAMP

and a copper plate. The latter forms the bottom of a copper pot, which is filled with water. Around the gas vessel is placed the winding of the magnetic field. To avoid a steady burning of the arc at one point, the carbon electrode is hollow. Around the carbon is placed concentrically an iron tube, which concentrates the magnetic flux. With 80 volts across the arc and 4 amp. direct current, a wave length of 3,000 m. at 5.5 amp. high-frequency current may be obtained with a suitable oscillatory circuit.—*Jahrbuch des Drahtlosen Telegraphie und Telephonie*, March, 1923.

## Illumination

*Paint Characteristics and Conditions to Be Considered in Effecting Better Illumination.* — C. H. BRYCE. — The author describes the two classes of paint—oil paints and water paints. In the first class are mentioned lead in oil, gloss interior, flat oil paint, gloss and flat enamels; in the second class, the kalsomines. Proper preparation of the painted surface for light reflection is discussed. The use of paint under artificial light and daylight is considered as well as other factors relative to the artistic and decorative use. Some interesting data on the variation of reflection factors of various paints under

different conditions are given in tabular form.—*Transactions of the I. E. S.*, April 1923.

*Refilling of Electric Lamps.* — O. RIGILLO.—A new and successful system of refilling worn-out electric lamps is explained and illustrated. At the end of the lamp a very small hole is made (about 6 mm. in diameter), and through it the lamp is cleaned, the old filament is taken out and the new one is introduced. The latter is elastic so that it can pass through the hole, but as soon as it is inside the lamp it opens. This refilling process can be made at a very reasonable cost and it requires but a few tools.—*Ingegneria*, Feb. 1, 1923.

### Motors and Control

*Motors for Mines with Explosive Gases.* — H. RICHTER. — The fine wire mesh which is used extensively in all open-flame miners' lamps to confine any explosion to the interior of the lamp has been found unsuitable for electric motors in which sparks are liable to occur. Much more satisfactory results were obtained with the plate protector, which is built up of a number of thin steel plates. In case of an internal explosion the gas pressure raises these plates about 1/16 in., and the resulting narrow slits permit the escape of the burned gases and yet cool them off sufficiently to prevent the ignition of outer gases. However, if one of these plates should become bent the entire protection would be lost and the motor would become dangerous. The latest types are therefore built totally inclosed and are so heavily designed as to withstand safely an internal pressure of 8 atmospheres. Every motor is tested by being filled with a mixture of 18 per cent illuminating gas and 82 per cent air, which is exploded by a spark. During this test the motor stands in a wooden box, also filled with the gas mixture. The motor is pronounced safe if its internal explosion does not ignite the outer gas atmosphere.—*Siemens Zeitschrift*, April, 1923.

*Starting Direct-Current Motors with Current-Limit Type Controllers.*—C. A. ARMSTRONG.—The principle of three types of series-lock contactors is explained and the operation of a motor-controller using these types of contactors is discussed. Diagrams and characteristic curves of various types of series lock-out contactors are given. —*Power*, April 24, 1923.

### Heat Applications and Material Handling

*Lining Acid Electric Furnaces.*—J. M. QUINN.—Careful selection of materials for lining the acid electric furnace is essential. It should be kept in mind that the materials containing the least amount of impurities have the highest melting point and therefore are more refractory than those containing elements which dilute the purity. The author describes the various materials which can be used and methods for handling them. What the author asserts to be the best method for lining an electric furnace is to use high-grade silica brick for the bottom and side walls up to the roof.—*Iron Age*, April 19, 1923.

### Electrophysics, Electrochemistry and Batteries

*Influence of Cold Rolling on the Properties of Sheet Steel.*—Y. NIWA and J. MATURA.—The change of the inner structure of steel by successive cold rolling as disclosed by the interference X-ray method is discussed. It is shown that the results obtained in the experiment may be interpreted by assuming that the crystal grains are divided by rolling stress into finer groups of cubic lattices which slide and rotate between adjacent planes and finally rearrange themselves in such a manner as to bring the edge of the lattice in parallel to the direction of rolling.—*Research Bulletin No.* 122 *of the Electrochemical Laboratory, Tokyo, Japan.*

*Current Distribution and Throwing Power in Electrodeposition.* — H. P. HARING and W. BLUM. — "Throwing power" in electrodeposition is defined as the deviation of the actual metal distribution from the primary current distribution. It is shown matematically and experimentally to be dependent upon the rate of change of cathode potential with current density, the resistivity of the solution and the cathode efficiency at different densities. A simple apparatus for the measurement of throwing power has been developed and applied to the study of copper sulphate and cyanide solutions. —*Paper presented before American Electrochemical Society, New York*, May 3-5, 1923.

### Traction

*New* 4,000-*hp. Electric Locomotives for Norfolk & Western Railway.*—T. C. WURTZ. — The conspicuously new features of the electric locomotives described in this article include cab structure carried by side frames of vanadium steel, four pairs of drivers in single truck per cab, a single 1,000-hp. motor per jack shaft, oil-insulated, force-cooled transformer and unique arrangement to reduce torque on any motor to prevent slipping. — *Railway Review*, April 14, 1923.

*Reducing Railway Maintenance Costs with an Electric Furnace*—The performance and results obtained through the use of an electric steel furnace of the Lehigh Valley Transit Company at Allentown, Pa., have proved that it is a very essential piece of apparatus for any electric railway. Through its use correct castings at a low cost are not only produced, but in a very short time and with very little inconvenience, so that it is unnecessary to withhold the equipment from service to any considerable extent while making repairs. The use of the steel furnace also enables the heads of various departments to make up special devices which result in labor saving and additional economies.—*Electric Railway Journal*, April 21, 1923.

*Application and Economics of Automatic Railway Substations.*—L. D. BALE. —An abstract of this paper may be found in the ELECTRICAL WORLD report of the A. I. E. E. midwinter convention, Feb. 24, 1923, on page 443.—*Journal of the A. I. E. E.*, May, 1923.

### Telegraphy, Telephony, Radio and Signals

*Distortion-Free Telephone Receivers.* —J. F. J. BETHENOD.—The possibilities of a distortion-free telephone receiver are discussed. By means of triode devices it is theoretically possible to make such an apparatus having uniform sensitiveness over any range of frequency required. The same device may be applied to oscillographic or radiotelegraphic apparatus.—*Proceedings Institute of Radio Engineers*, April, 1923.

*Signaling on the Frankford Elevated.* —J. N. DODD. — The special problems met and solved on this recently completed elevated line are discussed. The first article deals particularly with the signals, trips, electric circuits and air lines, while the second considers the interlocking plans and speed-control signals. The signals cause the motorman to run no faster than a predetermined speed and to encourage him to run close to it and in this way to obtain full capacity for the run. — *Electric Railway Journal*, April 28 and May 5, 1923.

*Tests of Radio Receiving Sets.* — During the past two years the Bureau of Standards has been developing methods for testing radio receiving sets and has tested a number of different types of equipment. This circular describes tests of regenerative sets using electron-tube detectors of the type intended for the reception of continuous-wave signals from arc transmitting stations on wave frequencies down to 60 kilocycles or wave lengths up to 5,000 m. A limited number of these circulars are available.—*Letter Circular No.* 90 *of the Bureau of Standards.*

### Miscellaneous

*Developments During* 1922.—This issue of the periodical is devoted to a series of illustrations of machinery and apparatus constructed or put into operation during the last year. These are classified under "electric traction," "prime movers," "generation and distribution," "electricity in industry" and "aircraft."—*English Electric Journal*, April, 1923.

*Suggestions for Saving Heat in Manufacturing Plants.* — C. L. HUBBARD. — The author outlines several methods for reclaiming much of the heat that is now ordinarily wasted in manufacturing plants, and the suggestions presented should furnish much food for thought to the engineer operating plants of this character. Some of the places where heat may be gained and the methods of accomplishing this are saving of frictional heat, reclaiming heat from ventilating air, reclaiming heat from moisture-laden air, etc.—*Power*, May 8, 1923.

# New Books

Reviews of the Latest Contributions to Technical, Industrial and Commercial Literature of Particular Interest to Members of the Electrical Industry

### The "Electrician" Handbook

Forty-first edition. London: Benn Brothers, Ltd. 1,364 pages.

This year's edition (the forty-first) of "The 'Electrician' Electrical Trades Directory and Handbook of the Electrical Engineering and Allied Trades"—the well-known "Blue Book"—contains the usual complete information on the electrical trades in Great Britain and all her colonies and possessions and has extenive information concerning the other countries of the world. Numerous British tariff changes have caused considerable revision of import duties. Among new subjects included in the volume are wireless broadcasting regulations and the conditions with which broadcast receivers must comply, an abstract of the electricity supply act of 1922 and particulars of the progress made with the reorganization of electricty supply—all these pertaining to Great Britain.

The various sections of the book contain an alphabetical and classified directory of electrical undertakings of all kinds and also a handbook of detailed and general information, such as a legal digest, wiring rules, tables, etc,

### Metals and Their Alloys

By Charles Vickers. New York: Henry Carey Baird & Company, Inc. 767 pages, 110 illustrations.

It appears that foundry practice in irons, brasses, bronzes and aluminum alloys is passing through a transition period. Books current and those being published in considerable numbers even now merely reflect conditions in thousands of small foundries scattered throughout the world. Shaping metal pieces by pouring melted alloys into molds is an art which has been known since antiquity. Following the general rule that the older the art the less is known about its fundamental principles, such foundries operâte largely by rule of thumb and tradition. Therefore it is not surprising to find that most of the books merely reflect these superstitions and practices.

Some engineering investigators have the hope that eventually the scientific principles underlying foundry management and production will be well known and that foundries in general will operate in strict accordance with those laws. That period undoubtedly is far in the future. However, scientific research has disclosed a number of attractive new alloys, which are being demanded in increasing amounts by consumers. Their production and even their heat treatment often involve entirely new processes at present unknown to the old-time foundryman. Therefore by press of circumstances he is being driven to a consideration of better production methods.

This book by Charles Vickers is typical of the transition stage. It has gone a long way forward from the foundry book published as recently as twenty years ago, without dipping under the surface of the tremendous ocean of material made available by more modern metallurgical research. Even though the author talks very little about scientific principles, the book apparently is free from the ridiculous beliefs and assertions which are spread as gospel truth in tons of "literature." As a compendium of useful information —"practical," if one will—this book is probably without an equal. It will find its way into the hands of every progressive foundryman or engineer interested in the production of non-ferrous alloys. E. E. Thum.

### Essais des Machines Electriques

By C. F. Guilbert. Paris: J. B. Baillière. 552 pages, illustrated.

This new book of nearly 600 pages, well illustrated with diagrams and figures, covers nearly the whole field of commercial testing of electrical machinery. There are sections dealing with direct-current generators and motors, alternators and synchronous motors, transformers, induction and alternating-current commutating motors and synchronous converters. For each of these types the author discusses characteristics of machines under load and predetermination of characteristics, followed by methods of direct and indirect testing and efficiencies.

The author, who has taught courses in electrical design and construction in French technical schools for many years, states that he wishes to shorten the time a machine must stay on test without sacrificing any accuracy, and in fact even increasing the effectiveness of the present commercial test, by making use of a "method of corrections" which he has used for some time. This is a method of correcting for variable speed (voltage, current, load or excitation) when this is supposed to have been kept constant.

The last hundred pages include appendices containing the French "Rules for Standardization and Specification of Electrical Material" (French Electrotechnical Committee), French rules for normal conditions of operation and test of turbo-generators, rules for standardization and specification of transformers and supplementary rules for standardization and specification of tests of electrical machinery—the last three of these being adopted by the Union of Electrical Manufacturers during June-July, 1920. At the end of the book is a very complete comparison of French, British, American, Swiss and German standardization rules.

M. Guilbert emphasizes the importance of graphic construction permitting the predetermination of characteristics of machines from experimental data that are comparatively easy to obtain at a relatively small expenditure of energy.

With its many references to original articles, its large appendices, its clear diagrams of connections and characteristic curves of machines, and, above all, its discussion of various tests and comparison of formulas, this book is a valuable addition to the engineer's library of books on commercial and laboratory testing. F. G. Tappan.

### Die Elektrometallöfen

By E. Fr. Russ. Munich and Berlin: R. Oldenbourg. 161 pages, 123 illustrations.

A review of the various types of non-ferrous furnaces used in America. Nearly all of the information is apparently abstracted from the bulletins issued by the Bureau of Mines and from various articles published in *Chemical and Metallurgical Engineering*. It seems at first as if the furnace which has prominence all through the book were an original design, but upon closer examination it is found to be practically a replica of the American Booth rotating furnace, built, however, for three-phase operation. For German conditions the author has no doubt done a great service toward popularizing electric alloy furnaces.
Arthur Palme.

### Der Funkentelegraphische Wetter und Zeitzeichen Dienst

By H. Thurn. Berlin: M. Krayn. 82 pages, 15 illustrations.

This booklet is a collection of articles by Mr. Thurn which have been published in German periodicals on the subject of radio broadcasting weather reports and time signals. A large part of the book is devoted to verbatim mention of rulings established at different international meetings. The Telefunken and the Huth sending, receiving and self-registering apparatus are described in detail, including the very latest time-registering set of Huth, which is based upon the Johnsen-Rahbeck effect. Arthur Palme.

## Insull Buys in Indiana

**Chicago Interests Take Control of the Northern Indiana Gas & Electric Company**

THE Northern Indiana Gas & Electric Company of Hammond, Ind., has been purchased by Samuel Insull and his associates of the Commonwealth Edison Company, the Middle West Utilities Company and the Public Service Company of Northern Illinois. Announcement of this purchase was made on June 4, when an official statement declared that arrangements have been made by Randal Morgan, representing the United Gas Improvement Company of Philadelphia, and Samuel Insull to pass over this Indiana utility to the Chicago interests represented by Mr. Insull. The United Gas Improvement Company will, however, remain interested in the property.

The Northern Indiana Gas & Electric Company supplies electricity in Hammond, East Chicago, Indiana Harbor, Whiting, Michigan City and other places in the north end of the state. It serves a community with a total population put at 421,365. Last year the total gas and electric business was about $10,000,000.

The official announcement declared: "The exact corporate plans have not yet been decided upon, but the business will be operated as a separate organization and not as a subsidiary of any existing companies. The plan involves operating under one organization gas and electric properties in northern Indiana which have been heretofore prorated separately and the greater portion of which were in the Northern Indiana Gas & Electric Company. The basic principle involved is the centralized production of both electricity and gas. It is probable that a large central station for the generation of electric power will be built in northern Indiana and electrical energy produced will be distributed not only in that territory, but also on the Illinois side of the line."

## Los Angeles Bond Issue Fails to Carry

A dispatch to the ELECTRICAL WORLD from Los Angeles says that the issue of $35,000,000 in bonds to cover projected activities of the Public Service Commission of the city of Los Angeles, which was submitted to the voters on Wednesday of this week, failed to receive the necessary two-thirds vote, though a small majority was recorded in its favor. Exact figures are not yet available, but they cannot change the result to a sufficient extent to authorize the bond issue.

Ten million dollars of this issue, had it been authorized, would have been spent in rehabilitating the city distribution system and in improvements to the municipal hydro-electric plant. The remaining $25,000,000 was to be used for power development at Boulder Canyon on the Colorado River after the completion of the government dam at that point.

## First Mercury Boiler Is Now Installed

The mercury boiler to be used by the Hartford Electric Light Company at its Dutch Point plant is in place and preliminary operation will, it is announced, start within a few weeks. This installation has attracted much interest because of its novel character. The boiler is installed outside the original station. Oil is to be used as a fuel. There will be approximately 15 tons of mercury used in the installation, and every precaution against leakage in the form of vapor will be taken.

It would not be possible to develop and operate this plant were it not for the electric and acetylene welding processes. Mercury amalgamates with copper, and as the temperatures used are so much higher than steam temperatures, there is no form of fiber gasket which will stand the temperature. The pressure used as compared with steam is extremely low. The maximum on this boiler will not be in excess of 35 lb. by gage.

The mercury boiler itself is built up of a large number of tubes with the edges welded together at the bottom. These tubes are hexagonal for about two-thirds of their length and circular at the top. The tops of the tubes are expanded into a plate and welded. All pipe connections from the boiler to the turbine are also welded. The mercury vapor passes normally through the nozzles to the wheel and is governed in approximately the same manner as any other revolving apparatus. In case of change of load on the turbine, the governor does not close the valve as in ordinary cases, but diverts the proper amount of vapor from the nozzles direct from the boiler to the condenser. This operation requires a damper rather than a tight-fitting valve. On account of the high temperatures it would not be practicable to use a valve, as at the high temperature of the vapor the steel is liable to warp.

## Signs Electrification Bill

**Governor Smith of New York Disregards Railroad Pleas—Gas Service Charge Prohibited**

ON SATURDAY last Governor Alfred E. Smith signed the Straus-Kaufmann bill providing for the electrification of all railroads operating within the limits of New York City. This measure was fought by the steam railroads on the ground of expense and difficulty, their representatives contending that an outlay aggregating more than a hundred million dollars will be entailed upon the roads. The New York Central, which now operates freight trains by steam over tracks running from Spuyten Duyvil to the lower end of Manhattan Island by way of Eleventh Avenue, will be hardest hit. The Long Island Railroad, however, will have to spend in electrifying its freight tracks, terminals and sidings more than $30,000,000, according to the general solicitor of the company; the Baltimore & Ohio will have to electrify its Staten Island terminal and lines, another tremendous piece of construction, while the many terminals along the Brooklyn water front will have to be electrified too. It is announced that the railroads will contest the law.

The Pennsylvania and the New Haven alone among the lines entering the city limits have completely electrified their lines to date.

### GAS SERVICE CHARGE FORBIDDEN

Another public utility bill signed by Governor Smith provides that the maximum gas rate in New York City shall not be more than $1 per 1,000 cu.ft. The courts last year declared the 80-cent rate prescribed by former legislation confiscatory. The gas companies will contest the new law, which sets up a 650 B.t.u. standard alleged to be unsafe, in the courts. Still another bill approved forbids gas companies to impose a service charge. While this bill is statewide in its application, it was drafted principally for the relief of gas consumers in Westchester County. From comments made by the Governor at the hearing on this bill it had been expected it would be vetoed.

Governor Smith has also affixed his signature to the Ryan bill, which authorizes the transmission and sale at cost by the state to municipalities conveniently situated of electrical energy generated above the needs of the canal system. This will apply to the surplus energy generated at the

state-owned plant at Crescent Dam and Vischer's Ferry on the canalized portion of the Mohawk River and will make possible its sale directly to the cities in the capital district.

The much-discussed Ryan bill amending the Public Service Commission law has become Chapter 891 of the Laws of 1923. This measure is not retroactive in effect, but does take away from the commission the right in the future to fix a temporary rate or charge and strikes out the provision that the commission may establish a new rate or charge "notwithstanding that a higher rate or charge has been heretofore authorized by general or special statute." Its intent is to put the law back to where it was prior to the amendments of 1921 in relation to the power of the Public Service Commission to raise rates.

## Southern California Edison Gets Prize

### The First Award of Gold Medal of the Charles A. Coffin Foundation, Established by the General Electric Company, Goes to Pacific Coast—Selected from Eighteen Contenders

THE Southern California Edison Company, Los Angeles, was presented on June 7 with the gold medal of the Charles A. Coffin Foundation, offered for the first time last year to the electric public utility company of the United States which made the most notable contribution during the year to the development of electric light and power service. This is the first award of the medal to be made by the foundation, which was created by the General Electric Company. The recipient was selected from eighteen electric light and power companies which submitted their year's records for consideration, and the decision is understood to have been extremely close.

John B. Miller

The award was made during the meeting of the public policy committee of the National Electric Light Association held in the course of the New York convention. Frank W. Smith, president of the association and chairman of the association's Charles A. Coffin prize committee, officially presented the medal, which was accepted by President John B. Miller of the Southern California Edison Company on behalf of the company.

President Smith's address took the form of a report of the committee which designated the recipient company. This committee consisted of Frank W. Smith, vice-president of the United Electric Light & Power Company of New York; Martin J. Insull, vice-president of the Middle West Utilities Company of Chicago, and Dr. Samuel W. Stratton, president of the Massachusetts Institute of Technology, Boston.

The medal was modeled by Chester Beach of New York, a well known medalist. The obverse side shows a bust of Charles A. Coffin, with the words "Charles A. Coffin Medal." On the reverse side the artist has shown man controlling the forces of Nature—water and heat—and driving them, in the form of electricity, over land and sea. Beneath this appears the inscription: "For distinguished contribution to the development of electric light and power for the convenience of the public and the benefit of the industry." In a panel appears the name of the company receiving the award.

Gold Medal of Coffin Foundation, Won by Los Angeles Central-Station Company

The award of the medal was accompanied by the presentation of a check for $1,000 to be applied to the employees' benefit fund of the Southern California Edison Company, under the terms of the foundation.

The Charles A. Coffin Foundation was established by the board of directors of the General Electric Company in December, 1922. It constitutes a tribute to Charles A. Coffin, who retired that year after forty years of association with the electrical industry, this period including the founding by him of the General Electric Company, of which he was leader for thirty years.

The foundation comprises a fund of $400,000, the income from which, amounting to approximately $20,000 per year, is to be devoted to rewarding outstanding service in the electrical field. In addition to the gold medal to be awarded annually to an electric light and power company, provision is also made for a gold medal to be awarded to an electric railway company. Fellowships to graduates of American colleges and technical schools amount to $5,000 annually and prizes amounting to $11,000 annually are provided for employees of the General Electric Company who have made signal contributions toward the increase of the company's efficiency or its progress in the electrical art.

## Colorado Springs to Vote on Franchise Next Week

The issue of a new franchise to the Colorado Springs Heat, Light & Power Company will, as already announced in the Electrical World, be put to a vote of the people on June 12. The election is the culmination of a bitter fight during the past few months between the City Council, the public and the power company. Six weeks ago a committee representing the bondholders of the company went to Colorado Springs and adjusted every claim that the City Council had against it, which included a cash payment of $115,000 to cover the cost of a pipe line which the city claimed should under the terms of the franchise have been built by the company. Subsequently the Council adopted a resolution bitterly condemning the utility and asking the people to defeat a renewal of the franchise, which will expire Sept. 8.

When the company brought Gen. George Goethals to Colorado Springs to investigate the power possibilities of the water system a few weeks ago he requested certain information from the city which was refused on the ground that it was confidential and that General Goethals had been brought to Colorado Springs for political purposes. This attitude of the city authorities aroused much criticism, but the situation, with its possibilities of municipal ownership, is too confused to permit any prediction of its final outcome.

## California Board Set Up

### Federal Power Commission Provides for a Subsidiary Body to Study Three River Problems

AUTHORITY to set up an interdepartmental board for the study of certain streams in California, bestowed by the Federal Power Commission a month ago, has been acted upon by the three government departments concerned—War, Interior and Agriculture—which have each appointed a representative to the new board, and the Governor of California is expected soon to designate a fourth member. The commission, according to an official announcement from Executive Secretary Merrill, is referring to the board for its examination, report and recommendations the three following matters:

1. The best scheme of development of the American River and its tributaries above Folsom.

2. The proposed diversion of the waters of the Trinity River into Sacramento Valley for power and irrigation purposes.

3. The best scheme of development of the North Fork of the Stanislaus River.

#### POINTS INVOLVED

It is desired that these matters be taken up in the order named and that each be made the subject of a separate report and recommendations. The following are the principal matters to be considered by the board, as explained by Mr. Merrill:

1. American River. Applications are on file for power developments on this stream which are apparently not suited to a complete and coherent development of the stream in the combined interest of power, irrigation, hydraulic mining and flood control. In carrying out its study the board should investigate and determine whether in its opinion the Rubicon River should be developed by diversion into the South Fork of the American River, by diversion into the North Fork of that river, by development along its own natural course, or by any combination of these; whether the Middle Fork of the American River should be developed by diversion into the North Fork, or along its natural course, or by a combination of these two. In general it is desired that the board draw up, to the extent that the data available warrant, a general plan for the complete development of the American River for power, irrigation and flood control above Folsom as designated, except that in considering the South Fork of the American River no consideration should be given to existing and proposed developments of the Western States Gas & Electric Company and the Eldorado Power Company, inasmuch as these projects are already covered by license from the Federal Power Commission.

2. Trinity River Diversion. Applications are on file with the commission for the construction of storage reservoirs and power projects on the upper Trinity River, for the diversion of the waters therefrom into the Sacramento Basin and for the construction of storage reservoirs and power plants after such diversion, the waters so diverted to be used eventually for irrigation in the Sacramento Valley. It is desired that the board investigate the effect of such proposed diversion upon power development on the remainder of the Trinity River, upon irrigation and fishing interests along that river and upon navigation at the mouth of the Klamath. It is also desired that the board review the proposed plans for development within the Sacramento Basin, and finally, that it reach conclusions as to whether in view of all the interests involved it is desirable that such diversion be authorized.

3. North Fork of Stanislaus River. The commission has before it an application contemplating the creation of storage on a tributary of the North Fork of the Stanislaus River for use in connection with existing canals and power plants in the vicinity of Angels and Murphy. It appears probable that a development such as proposed is not economical and might seriously interfere with the complete development of the stream. The present diversion through the old mining ditch cannot be changed because irrigation rights have grown up in the vicinity of Murphy and Angels which cannot be set aside. An increase in the amount of water taken through this ditch might set up new rights and make it impracticable to return the waters to the stream in a manner which would provide for the best utilization of the power. It is desired that the board review this situation, investigate the various interests involved, and report to the commission what plan of development will, in its judgment, be best suited to make a complete utilization in the public interest.

## Former Secretary Fall Has Electrified Ranch

Albert B. Fall, former United States Senator and Secretary of the Interior, has just finished installing a hydroelectric plant and power transmission system upon his ranch at Three Rivers, N. M. It is now said to be the most modernly equipped ranch in the matter of light and power in the country. Although the plant was installed primarily for the purpose of furnishing power for pumping water for irrigating a large tract of cultivated land upon the property, the electrical energy is transmitted to the various buildings. The plant is of 75 hp. capacity. The water is diverted about half a mile above the mouth of Three Rivers canyon and then carried two miles through concrete and steel pipe to the power house, where it produces a pressure of 226 lb. at the nozzle of the Pelton wheel. Should the water get low in the river, a big Diesel engine is in reserve to furnish power. The energy is carried to the junction of Three Rivers and Indian Creek, where there are a number of wells. More wells are to be drilled and equipped with modern pumping plants.

## Boston Edison Expansion

### Station Development Problems Debated and Plans Explained at Providence Meeting

ASPECTS of the Edison Electric Illuminating Company of Boston's generating-plant development problem were reviewed at a recent meeting of the Providence Engineering Society by George E. Seabury, superintendent station engineering department. The expansion of the L Street station in South Boston from its original design of 1903 for twelve 5,000-kw. turbogenerator units to a rating of 186,000 kw. in the fall of 1923 marks the limit of this installation unless some of the older units are removed. About eight years ago the company began studying new plant developments, and on the site of the new Weymouth station sixty-three acres will soon be available for future requirements. Present plans provide for about 300,000 kw. at Weymouth, the initial installation to be two 30,000-kw. units.

Brief announcements have been made as to the contemplated use of 1,000 lb. to 1,200 lb. steam pressure in a portion of the Weymouth equipment. Preliminary studies of high-pressure possibilities showed that if a maximum steam temperature of 700 deg. F. were adopted on account of the limitations of the steels now on the market, very attractive economies could be secured with pressures of 1,000 lb. to 1,200 lb. A basic pressure of 375 lb. is contemplated for the 30,000-kw. units at Weymouth. Directly connected to one of these will be a high-pressure turbine to operate at 1,000 lb. or over, exhausting into the 375-lb. main feeding the larger unit. The high-pressure unit will exhaust into a reheater which forms a part of the high-pressure boiler equipment. It is planned to install one boiler to operate at 1,000 lb. to 1,200 lb. pressure and three boilers to operate at 375 lb., the latter serving one 30,000-kw. and the former one 2,000-kw. unit. As is now indicated, the high-pressure boiler will be built for use with a steel-tube economizer. At 1,000 lb. steam pressure it will deliver 110,000 lb. of steam per hour and at 1,200 lb. 133,000 lb. of steam per hour. The Edison company's engineers are of the opinion that it is unsafe to go to a steam temperature as high as 800 deg. F., since above 700 deg. the strength of steel falls off rapidly. It is possible that a maximum of 725 deg. may be attained.

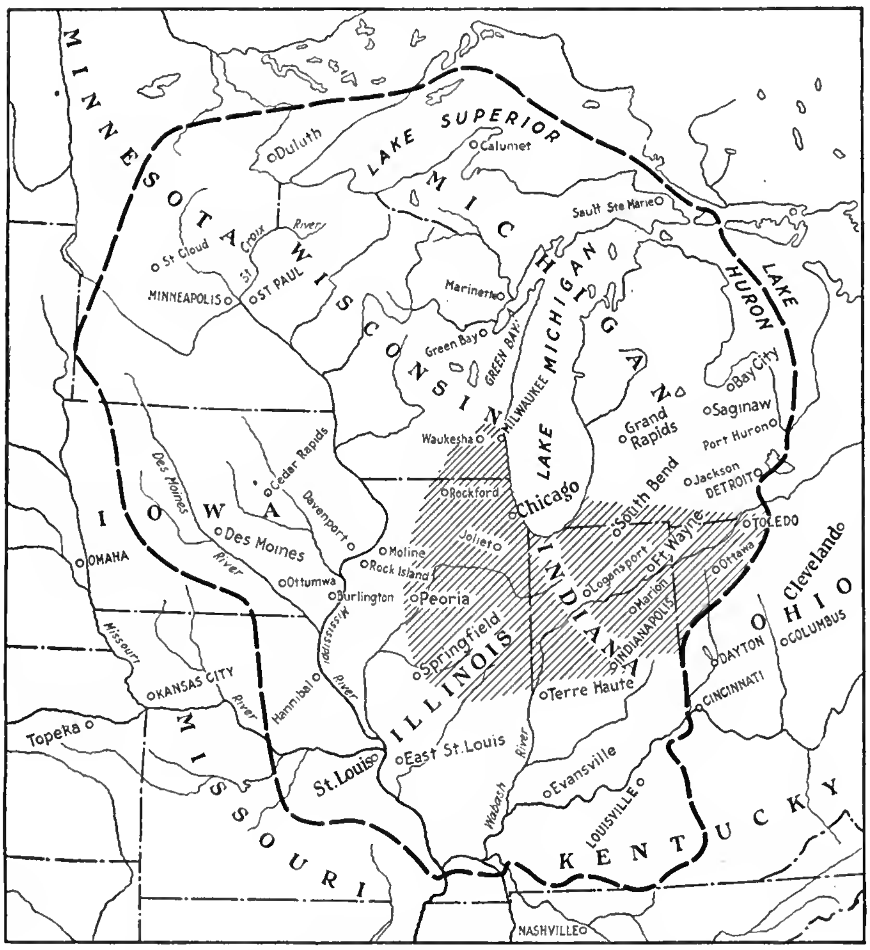
#### ADVANTAGES OF WEYMOUTH SITE

Unusually good facilities for handling heavy machinery and materials in bulk are available at Weymouth. The Fore River shipyard of the Bethlehem Steel Corporation is opposite the station site. The plant will add many million dollars to the taxable valuation of Weymouth. Fresh-water make-up may require separate piping facilities from the system of the Metropolitan District Commission. The coal-storage capacity is being figured on the basis of one ton

per kilowatt of station rating. Two coaling towers of 400 tons per hour rating each will be installed at first, followed by a third. Heavy machinery can be delivered directly to the plant from lighters and then moved into place.

On the electrical side it is planned to use 14,000 volts on the main buses and 2,300 volts for station service. A 2,300-volt steam turbo-generator will be provided for emergency service, but auxiliaries will be motor-driven and the heat balance maintained by bleeding steam from the main units. These are to be of 85 per cent power factor, and the switch house will be built with a closed-ring bus layout, sectionalizing by bus tie switches and providing for a transfer bus. Vertical separated phases will be used. The site affords ample room for switching equipment, and the completion of the station will probably be associated with the addition of a high-voltage loop system of transmission lines connecting the more important substations at the west of Boston with Weymouth and L Street. Before construction work was begun an exhaustive study was made of fuel oil and pulverized coal for possible use at Weymouth, but the present status of the market, outlook for future supply, cost of auxiliary apparatus and installation expense, uncertainty as to maintenance costs and positive experience of the company as to the performance of underfeed stokers burning bituminous coal contributed to the decision to pass by these other methods for the present.

## Development Plan of Great Lakes Sections, N. E. L. A.



MAP OF PROJECTED NINE-STATE POWER SURVEY, SHOWING PORTION TO BE FIRST DEVELOPED

THE first report of the power survey committee of the Great Lakes Division, N. E. L. A., noticed in the ELECTRICAL WORLD for May 19 (page 1166) and now available for distribution, gives, as stated in that issue, the outlines of general development which would supply the future power needs of the Great Lakes territory most economically, to the end that all extensions planned now and in the future may be in conformity with a comprehensive plan.

The method of procedure to be followed is somewhat as follows: Growth both in population and industrial development will be estimated for the various portions of the area, all economic conditions, such as rail and water transportation and accessibility to coal fields, receiving due weight; the general locations of "capital stations"—plants with a capacity of 200,000 kw.—will then be planned and trunk lines and secondary distribution circuits will be considered. The committee is looking into the future up to 1950.

The general territory under consideration reaches from Detroit on the east to the southern watersheds of the Ohio River, thereby including Louisville; thence extends westward to take in St. Louis, Des Moines and Minneapolis and swings across upper Michigan back to Detroit, including or impinging on nine states. The area for immediate study will have Chicago as a center and include Milwaukee, Peoria, Springfield (Ill.), Indianapolis, Detroit and South Bend. This is the shaded area on the map. H. H. Field has been chosen as engineer-secretary to handle this work, with offices in the Edison Building, Chicago.

## Trip Up Big Horn Canyon

### Interior Department Engineers Report on Its Potential Water Power in Wyoming and Montana

THE potential water power of Big Horn Canyon in Wyoming and Montana and its utilization are considered in a report just prepared by Benjamin E. Jones and David J. Guy, hydraulic engineers of the Department of the Interior. The two engineers made a trip through the canyon in 1921. Their report is based on information obtained on the trip, on topographic maps of the canyon prepared by A. W. F. Koch of Hardin, Mont., engineer of the Big Horn Canyon Irrigation & Power Company; on stream-flow records obtained at Hardin, Mont., for the period 1905 to 1920, and on other information available in the Interior Department.

In the stretches above and below the canyon the Big Horn flows through broad basins in which there are irrigated lands on both sides of the stream and bench lands farther back. The canyon itself lies in a huge fold of the rock beds that form the north end of the Big Horn Mountains. Through this fold the river has cut its winding way in a deep, narrow gorge 50 miles long, which begins 8 miles south of the Montana-Wyoming boundary. A trip on this stream involves real peril.

Big Horn River falls 450 ft. in the canyon and has a flow of 1,500 second-feet for 90 per cent of the time and 2,475 second-feet for 50 per cent of the time. Without storage the potential power for 90 per cent of the time at 70 per cent efficiency is 54,000 hp. and for 50 per cent of the time it is 89,000 hp. Suitable dam sites are numerous and can be developed economically as soon as a market for the power is available.

The Big Horn Canyon Irrigation & Power Company proposes to build a dam near the mouth of the canyon to a height of 480 ft. above the foundation and 450 ft. above the low-water surface of the river. Such a dam would utilize the entire fall in the canyon, and if the upper 200 ft. of the reservoir were used to store water the total flow of the river in years of low water could be equalized and a continuous flow of 3,100 second-feet obtained. The dam would make available 84,600 hp. con-

tinuously. The proposed capacity of the turbines is 165,000 hp. It is also proposed to take water from the reservoir at a point 200 ft. above the river and carry it by canals down both banks to irrigate 60,000 acres of bench land between the canyon and Hardin, Mont.

The report considers plans for developing the potential power of the canyon by one, two and three dams and points out the advantages and disadvantages of each plan.

Its publication may be delayed, and to make the data immediately available to the public manuscript copies have been placed on file at the office of the Geological Survey in Washington, D. C., and at the office of the district engineer in room 52, Montana Bank Building, Helena, Mont., where they are now open for inspection.

## For Interstate Connection

### New York Commission Authorizes Adirondack-New England Tie —Sanctions Hydro Plant

THE Public Service Commission of New York granted permission to the Adirondack Power & Light Corporation on Tuesday to construct a transmission line through portions of the towns of Stephentown, North Greenbush, Nassau and Sand Lake, Rensselaer County. The transmission line is to be constructed under franchises obtained from the town boards of those towns. The order of the commission provides that no electrical energy shall be sold or distributed by the Adirondack Power & Light Corporation either directly or indirectly in any of the towns through which the said line will pass.

The memorandum on which this order was granted shows that the transmission line will furnish a connecting link between the distribution lines of the Adirondack Power & Light Corporation and those of the New England Power Company. The line will be used for the transmission of energy between those two companies as needed.

PERMIT FOR NEVERSINK DEVELOPMENT

The commission also granted to the Oakland Power Company permission to construct a hydro-electric plant on the Neversink River. The plant will be in the towns of Forestburgh, Thompson and Mamakating, Sullivan County, and in the town of Deer Park, Orange County. No transmission line will be constructed by the company as all electrical energy will be sold at its switchboard to other electrical corporations authorized to purchase and transmit it.

The commission approved an application of the Mutual Electric Company and the Hornell Electric Company for consent to the transfer of the franchises and electric plant of the first-named company to the Hornell company. The order also approves an operating contract entered into between the two companies and permits the Hornell company to construct an extension of its electric plant in the towns of Hornellsville and Dansville under franchises which have been received from the local authorities.

## Granite Men to Pay Increased Rate to Montpelier Company

Withdrawal of opposition to a 15 per cent average power-rate increase by granite manufacturers served by the Montpelier & Barre (Vt.) Light & Power Company will, it is thought certain, result in approval of the advanced rate by the Vermont Public Service Commission. For more than a year the company deferred filing increased rates because of unsatisfactory economic conditions prevailing in the granite industry, which is the largest consumer of power in the territory. For some time, however, the company has been barely able to pay its fixed charges and operating expenses, and since July, 1921, it has paid no dividends. It therefore made an increase of half a cent per kilowatt-hour for power service, effective April 1, 1923. At a hearing before the commission the point was made that lack of credit made it impossible for the company to borrow funds to complete the installation of a 2,500-kw. steam turbine unit for which foundations had been prepared and that other important work had to be held in abeyance because of the inadequate net earnings of the company. Following this frank statement came the information that the manufacturers' association was prepared to withdraw its opposition.

## New England Power to Replace Older Units at Vernon

To obtain greater efficiency in the use of water at the Vernon (Vt.) station of the New England Power Company, it has been decided to replace four of the original 2,500-kw. three-runner vertical generating units with 3,000-kw. two-runner units. One of the new units will probably be installed yearly, beginning on the New Hampshire side of the Connecticut River.

When the Vernon station was originally built eight 2,500-kw. units of the three-runner type were installed, the plant being placed in operation in 1909. The operating head was 35 ft. and the flood rise of the river about 30 ft. The three-runner design and the type of gate rigging and control then available for low-head plants led to high cost of maintenance, difficulty in keeping the equipment up to capacity and difficult accessibility at the lowest wheel of each unit. With the growth of the system the maximum short-time peak capacity of the station became needed, with the possibility of operating some units at light load as motors for power-factor correction without water loss, and in 1921 the plant was extended by the installation of two 4,200-kw. single-runner vertical units. These units can be motored with the headgates open and wheel gates closed with minimum leakage and still be ready to supply power on short notice.

## Public Utility Advertising

### First Meeting of New Association Draws Out Excellent Papers at Atlantic City

THE sessions of the first annual convention of the Public Utilities Advertising Association, held at Atlantic City on Tuesday last in connection with the convention of the Associated Advertising Clubs of the World, were attended by representatives of the national utility associations and state committees on public utility information and by delegates controlling the public relations, advertising and publicity departments of many individual public service corporations. A remarkably good program was presented. B. J. Mullaney of Chicago was chairman of the morning session and Frank Leroy Blanchard of New York chairman of the afternoon session.

Mr. Mullaney outlined the needs of advertising in the four major utility industries as follows: (1) Service advertising, to gain volume by exploiting advantages and uses of the service; (2) merchandise and appliance advertising, in the case of electric and gas companies, to sell goods at retail; (3) financial advertising to sell the securities that must be issued to provide extensions and additions to plant and equipment; (4) institutional advertising to lend background to the other three.

Grover C. Maxwell of Columbus, Ohio, former secretary of the Ohio Public Service Commission, emphasized the urgent need of a proper balance between straightforward, honest advertising and authoritative and interesting news articles, together with forceful and truthful public speaking, as the best way of telling the public the real story of the public utilities. James O'Shaughnessy expressed the view that there is an exceptionally valuable opportunity for economic co-operation between the utility companies and the advertising agencies.

W. S. Vivian, director of public relations of the Middle West Utilities Company of Chicago, stressed the great importance of getting the public to realize that the problems of the utility are the problems of the public. J. C. McQuiston, manager of the publicity department of the Westinghouse Electric & Manufacturing Company, laid emphasis on the necessity of friendly relations between the companies and the newspapers.

Francis H. Sisson, vice-president of the Guaranty Trust Company of New York, read a paper on "Public Utilities and Public Relations," dealing with the power of the printed word and the value of good will and advertising as factors in economic education.

W. H. Hodge, of H. M. Byllesby & Company, discussed the practical side of customer-ownership advertising. Chairman Blanchard spoke of the value of the new association and explained the methods and machinery of a well-organized and effectively functioning department of public relations.

## War Department's Tests Rank Moody Draft Tube High

At the suggestion of Hugh L. Cooper, the Corps of Engineers, United States War Department, recently undertook a series of experimental tests of great interest to hydraulic engineers and others concerned with hydro-electric power development. The object of these tests, which have just been completed, was the confirmation of the data upon which the department had based its decision to employ the Moody spreading draft tube in the Muscle Shoals power station, but it was decided to make the tests comprehensive in character, with a view not only to obtaining authoritative data regarding the relative efficiencies of various draft-tube designs, but also to making possible an estimate of the actual capital savings represented by improvements in draft-tube efficiency, and to compare these with the increase, if any, in construction cost which might be incurred by installing the most efficient type.

This latter point was of especial interest to Colonel Cooper, and as the War Department placed the supervision of all the tests in the hands of his firm, the result was the collection of a body of data which not only forms a very important contribution from an authoritative and impartial source to present hydraulic engineering knowledge, but should, it is thought, also result in the possibility of considerable capital savings in forthcoming hydro-electric power enterprises. All the tests were carried out in the I. P. Morris laboratory of the William Cramp & Sons Ship & Engine Building Company at Philadelphia, which was loaned to the War Department by that company for the purpose. In every test, the I. P. Morris representatives announce, the Moody tube showed highest efficiency under all conditions and entirely vindicated Colonel Cooper's judgment in its selection.

The report includes a graphic representation of the tests in a series of curves plotted under varying conditions of effective head, turbine speed and load, showing turbine efficiency and power output for each type of tube. In all, without exception, the Moody type shows a clear lead over any other design. It is understood that a complete report is now in preparation and will soon be published.

## Santee River Project Will Be Pushed

Final plans are being prepared by T. C. Williams, vice-president of the Columbia Railway & Navigation Company, covering the project which involves the diversion of the Santee River through a canal 15 miles long to the Cooper River, near Moncks Corner, above Charleston Harbor, S. C. The plans are being perfected with the aid of engineers of the Foundation Company.

Recent investigations have shown that this project is more attractive than was supposed at first. It has the backing of a very active local sentiment. An application for license will be made in the near future. The tentative plans provide for an initial diversion dam which would develop a head of 55 ft. and an initial installation of 30,000 hp. to 50,000 hp. Provision will be made for the construction later of a dike and a higher dam which would raise the head to 70 ft. and permit of an ultimate development of 150,000 hp. In that connection it is pointed out that there are few points on the flat coastal plane where such a high head could be obtained. The feasibility of the project is enhanced by the progress of hydro-electric development on the upper tributaries of the Santee, such as that of the Southern Power Company on the Catawha and Congeree. These reservoirs in recent years have raised the low flow of the Santee from 3,000 cu.ft. to 10,000 cu.ft. per second. The contemplated development will go much further toward flattening out the high-water flow and raising the low-water discharge.

The success of the project depends to a considerable extent on the amount of flow which the War Department will insist must pass the dam to maintain navigation on the Santee below the point of diversion. The city of Georgetown, on the coast, is vitally interested in keeping this navigation channel open, although it is not used at present. The power company hopes to obtain permission to divert all of the Santee with a proviso that whenever the Secretary of War directs a minimum discharge of 3,000 cu.ft. per second will be allowed to pass. It is believed that this proviso would meet the requirements of navigation were it established.

# A. S. M. E. Hears of Canada's Water Power

### Hydro-Electric Possibilities of Quebec Are Put at 13,000,000 Kw. and Those of Ontario at 6,000,000 Hp.—A New Fuel Described—Proposed Steam-Boiler Code

A GLOWING outline of the vast potential water powers of Quebec and Ontario was exhibited to the Montreal spring meeting of the American Society of Mechanical Engineers last week by Julian C. Smith, general manager of the Shawinigan Water & Power Company, who spoke for Quebec, and Frederick A. Gaby, chief engineer Hydro-Electric Power Commission of Ontario, who represented the latter province.

Pointing out that Quebec's area of 706,804 square miles is about one-fifth that of the United States, Mr. Smith said the province contained actual possibilities for developing 13,000,000 kw. to 15,000,000 kw. continuously. At present the economic possibility for development is 5,250,000 continuous kilowatts, of which 800,000 kw. is now available. The principal water powers are on the Ottawa, St. Lawrence, St. Maurice, Saguenay and St. Francis Rivers. Cedars Rapids will develop 229,000 hp. in the near future, and Shawinigan and other stations now supply 157,000 electrical horsepower to the paper industry. Mr. Smith described the Duke-Price project on the Saguenay, where Lake St. John, at the head of the river, serves to control flow and act as a reservoir. The watershed is over 30,000 square miles in area, and there is a 300-ft. fall in a distance of 25 miles. Four hundred thousand horsepower will be eventually developed at the source of the Saguenay and 800,000 hp. farther down. A 400,000-hp. plant will be in operation in two or three years. On the St. Maurice the Shawinigan company is installing 65,000 hp. in four units, and on the Ottawa River 600,000 hp. will be available before 1924. Quebec has a total of 1,070,000 electrical and hydraulic horsepower developed, and growth curves indicate the need for the entire 7,000,000 possible horsepower within twenty-five years. Philip S. Gregory, who read the paper for Mr. Smith, said that surplus water power was used for electric boilers in several plants, but that energy would have to sell at about 2 cents a kilowatt-hour before it could compete with ten-dollar coal for such purposes.

#### Ontario Water Power

Mr. Gaby put the potential water power of Ontario at 6,000,000 hp., of which 1,300,000 hp. has been developed. He said that estimated ultimate development was only approximate because of the many variable factors encountered and the incomplete data. In Ontario, with an area of 400,000 square miles, the St. Lawrence and the Niagara afford the greatest power, with some on the Nipigon and some on the smaller rivers in the north and central portions. The Hydro-Electric Power Commission, which acts as trustee for 350 municipalities, has developed 625,000 hp. and operates 3,500 miles of transmission lines. Mr. Gaby said. The longest line is 254 miles to Windsor, and 110,000 volts at 25 cycles is the system voltage. At the present rate of growth the system needs 100,000 hp. to 150,000 hp. more capacity each year. The commission operates interconnected districts in central Ontario and one system on the Nipigon. On the Niagara system there is at present 540,000 hp. and will be ultimately 820,000 hp. In the Severn district there is 6,000 hp. and the same amount in the Eugenia district. In central Ontario 40,000 hp. is in operation, and in the Nipigon region there is an ultimate possibility of 200,000 hp. On the St. Lawrence there are two possible sites, in the opinion of Mr. Gaby—at Morrisburg, where 600,000 hp. to

800,000 hp. can be obtained, and at Cornwall, where 1,200,000 hp. can be developed. On the Nipigon 200,000 hp. can be obtained from sites at Virgin Falls, Cameron Falls and Alexander Landing.

The commission now has 628,000 hp. in operation and has utilized the capacity available from the streams without storage. The system is well loaded and as a result steps are being taken to arrange for storage capacity to insure more power. Another million horsepower is expected from Niagara and 1,500,000 hp. from the St. Lawrence, but the load curve indicates that this power will be used at the end of ten years.

#### LOAD DOUBLES IN SIX YEARS

In discussing the papers W. M. White, Allis-Chalmers Manufacturing Company, pointed out that standards of living and wages were fixed by the per capita use of power and that all possible power should be used immediately by those ready for it. Fred Darlington, Westinghouse Electric & Manufacturing Company, observed that interconnection and steam supplementary stations were needed to give economical power to industry and advocated the immediate development of water powers in order to avoid waste of energy and to conserve fuel. John R. Freeman thought that statesmanship and foresight were needed to anticipate power demands and complimented the Dominion government on the foresight shown by the water-power department. Mr. Gregory, in closing, stated that the load doubled every six years in Quebec and that interconnection helped greatly in obtaining better system operation by taking advantage of stream-flow variations in different sections.

#### A NEW FUEL

A paper on "Lignite Char" was read by O. P. Hood of the United States Bureau of Mines. Mr. Hood explained that lignite char is a lignite which has been dried and distilled in an oven especially designed for this purpose. About 2½ tons of raw lignite reduce to one ton of char, the heat value of which is about 12,000 B.t.u. per lb. Unlike the German brown coal, the American lignites do not briquet well without the addition of a binder, and the Bureau of Mines has therefore been led to investigate the possibilities of an inexpensive carbonizing process and the use of the resulting char direct without briquetting.

The boiler code committee held public hearings for the discussion of proposed rules for the care of steam boilers in service and a proposed code for the inspection of steam boilers. As in the case of the power-equipment code and the internal-combustion-engine code referred to last week, co-operation with the appropriate committee of the N. E. L. A. will be sought.

About 250 engineers from the United States attended the convention, which was held in conjunction with the Engineering Institute of Canada. A number of interesting trips of inspection were made. Fred R. Low, editor of *Power*, was nominated as president for the ensuing term.

## Powerdale Plant Starts

**New Power House of Pacific Power & Light Company at Hood River, Ore., Goes Into Service**

THE new Powerdale hydro-electric plant of the Pacific Power & Light Company at Hood River, Ore., was started with appropriate dedicatory exercises on May 10. President Guy W. Talbot in welcoming the visitors said that about 25 per cent of the capital invested in the plant came from the sale of securities in the local market.

The plant is built in a beautiful canyon on the Hood River, just outside the city of Hood River. The intake work for the pipe line is 3 miles farther upstream. About 3 miles above the generating station a concrete diversion dam is constructed across the river. The 8,700-hp. vertical-type turbine, designed for 180 ft. head and 360 r.p.m., was manufactured by the I. P. Morris Department of William Cramp & Sons. The upper end of the turbine shaft carries the Westinghouse three-phase, 60-cycle, 7,200-volt generator and its exciter. A Kingsbury bearing above the generator carries the weight of the unit. Lubrication is provided by means of a water-cooled, forced-circulation oiling system. The output of the unit is rated at 6,000 kw. at 80 per cent power factor, or 7,500 kva. The switching is handled by a twelve-panel, remote-control switchboard supplied by the General Electric Company.

The generating and switching equipment are housed in a remarkably small building. The power house is only 47 ft. x 82 ft. x 17 ft. high and is constructed of hollow-tile concrete plastered. To facilitate repairs to the turbine and generator unit, two large hatches are provided in the roof, one directly over the generating unit and the other over a spare room where repair work can be carried on. A large 40-ton gantry crane straddles the power house and serves to lift the heavy equipment through the roof hatches.

An outdoor type of transformer substation is used, three 2,500-kva. self-cooled, oil-insulated, radiator-type Westinghouse 6,600/66,000-volt transformers being mounted on a raised concrete platform adjacent to the power house.

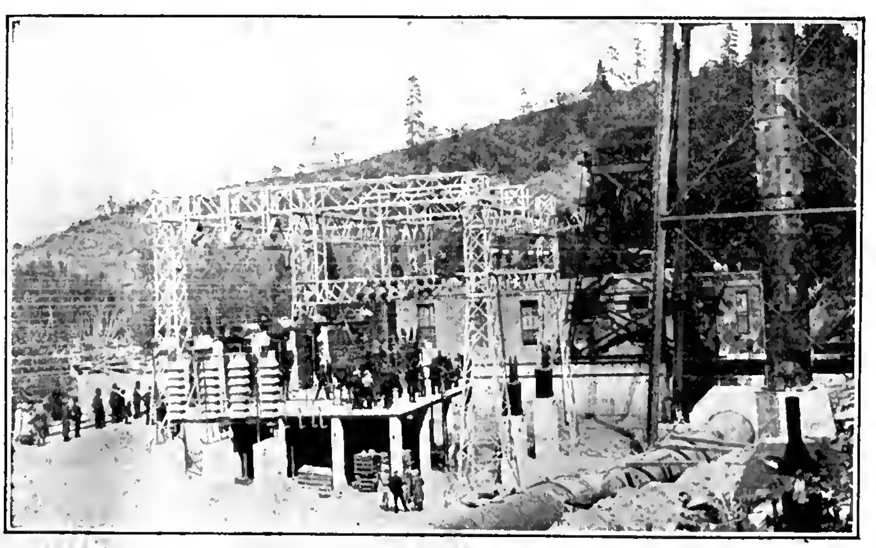
Final surveys for this plant were made in May, 1922, and actual construction work started about June 1. Credit for its rapid completion is due in a large measure to H. H. Schoolfield, chief engineer for the Pacific Power & Light Company, and J. E. Shinn of the Phoenix Utility Company, who was superintendent of construction on this work.

## New York to Have Electrical Board of Trade

The Electrical Board of Trade of the City of New York, representing every branch of the electrical industry, was formally organized last week in the office of Arthur Williams, general commercial manager of the New York Edison Company. Mr. Williams is president and the chairman of the board is Charles L. Eidlitz, the recently appointed "Czar" of the electrical contracting business in Greater New York.

The Electrical Board of Trade was organized as the result of conferences of representatives of the electric light and power companies, telephone and telegraph companies, manufacturers, jobbers, contractors, distributors and dealers. It will act as a clearing house for credits and other information desired by the trade, but, it is announced, will not in any way deal with prices.

The officers elected, besides Mr. Williams and Mr. Eidlitz, were: Vice-presidents, Walter J. Drury of the Western Electric Company, William C. Peet of the Peet & Powers Company and Theodore Beran of the General Electric Company; treasurer, John P. Ryan, Cleveland & Ryan, and secretary, John MacIntyre.



OUTDOOR SUBSTATION, VENTURI METER AND SURGE PIPE IN FOREGROUND; GENERATING STATION IN BACKGROUND

## Pressure at 3,200 Pounds

### This Will Be Feature of a Plant Now Being Built at Rugby for English Electric Company

AN EXPERIMENTAL superpressure steam plant now nearing completion, designed by the Benson Engineering Company of London and soon to be erected in the works of the English Electric Company at Rugby, England, is to employ a pressure of 3,200 lb. per square inch and will have a temperature of 706 deg. F. The heating elements are of very small section and have no steam drums or chambers. Steam will be generated at a pressure above that named, then throttled to 1,500 lb. and, after being superheated to 788 deg. F., will be passed through a high-pressure turbine exhausting at 200 lb. per square inch. The exhaust of the high-pressure turbine is to be reheated to 662 deg. F. and then expanded in a standard normal-pressure turbine to 29-in. vacuum.

The builders of the plant predict not only that it will consume about 28 per cent less fuel than a high-grade plant of the same capacity operating at 250 lb. pressure, but that it will also be cheaper to build and maintain. The plant is declared to be equivalent to a 1,000-kw. commercial plant. The great jump from 1,500 lb. pressure, the highest previously employed, to 3,200 lb. is due entirely to the fact that at any pressure below 3,200 lb. latent heat must necessarily be added, with consequent troubles from boiling and priming.

## Brief News Notes

**Another Metermen's Course.**—The third short course for metermen conducted by the electrical engineering department of the University of Illinois is to be held on June 11-16. Two courses of instruction have been prepared, one for men who have had little or no experience in meter work and one for more advanced men.

**Brookfield Rejects Municipal Ownership.**—The people of Brookfield, Mo., had an opportunity to express themselves last month on the question of substituting a municipal electric plant for the privately owned central-station plant of the North Missouri Power Company. The result was overwhelmingly in favor of continuance of the privately owned plant, the vote standing: For municipal ownership, 250; against, 1,042.

**Denver Tramway Purchases Two 10,000-Kw. Turbines.**—The Denver Tramway Company has purchased two 10,000-kw. turbines from the government which will be installed in its steam plant at Denver. The machines are to be ready for operation by Aug. 15. The installation of these two new units will bring the company's generating capacity up to 30,000 kw., and it will no longer need to purchase power from a local power company.

**Shooting Holes in a Smokestack.**—Nowhere is the resourcefulness of the public utility operator more often shown than in the small community. The Richmond (Ky.) plant of the Kentucky Utilities Company has one smokestack for three boilers. A windstorm crumpled the stack so that smoke could not pass through it, and to maintain service it was necessary to create a draft in some manner until such time as the hanging portion of the stack could be removed. The problem was

solved by Manager George Fawkes, who procured a shotgun and riddled the top of the erect portion with holes skillfully drilled where they would do the most good.

**University to Install 30-Hp. Turbine Wheel.**—The University of California has recently ordered from the Pelton Water Wheel Company of San Francisco a 30-hp. impulse turbine for use in the hydraulic laboratory of the College of Mechanics at Berkeley. The turbine, which will be installed before the opening of the fall semester, will operate under heads up to 300 ft. It will be provided with a hand-operated needle nozzle and governor-controlled jet deflector.

**Metermen's School Held at University of California.**—A short course for metermen was given from May 14 to 19 at the University of California at Berkeley. The course was arranged through the co-operation of the meter committee of the Pacific Coast Electrical Association, the power companies and the extension division of the university. The course included technical lectures, recitations and laboratory work. It will be made an annual event.

**Los Angeles Company's New Office Building.**—A site for the new office building of the Los Angeles Gas & Electric Corporation has been purchased by the company. According to William Baurhyte, vice-president and general manager, the building, which is to cost $1,250,000, will be of sufficient size to accommodate the company for many years. It will contain an assembly hall for meetings between officials and employees and for employees' organizations. Construction is to be pushed.

**Pacific Power & Light to Build Interstate Line.**—One of the important construction jobs to be undertaken by the Pacific Power & Light Company this year is a transmission line from Kennewick, Wash., to Umatilla, Ore., and thence on to Pendleton, Ore. Power will be wholesaled to the Hermiston Light & Power Company, operating in northeastern Oregon. Surveyors are now in the field locating the line.

**Dothan's Municipal Plant Meets Obstacle.**—Court action threatens to hold up the erection of a municipal hydroelectric plant at Dothan, Ala., the allegation being made that a sale of bonds was illegal. Pending the hearing of the petition for an injunction work is proceeding on the plant, which is being erected on the Choctowhatchee River, about 20 miles from Dothan, and will, it is said, cost $900,000. Dothan has a population of 12,500 and is in the extreme southeast of Alabama.

**Lighting Alleys Reduces Burglaries in Denver.**—Lighted alleys, made possible through a new city ordinance, are gradually decreasing the number of burglaries and hold-ups in the downtown district of Denver and are giving protection to the policemen on downtown beats. "Before the lights were installed there was an average of two burglaries a night in the business district," declares a high police official, "but in the week after the lights were installed we had only two burglaries in the section." The lights are 100 ft. apart.

**Use of Kilocycles in Radio.**—In accordance with the recommendation of the second national radio conference, the Department of Commerce and other government departments will hereafter follow the practice of specifying radio waves in even values of kilocycles rather than in meters. The relation between the two is indicated by the following rule: "To obtain kilocycles, divide 300,000 by the number of meters; to obtain meters, divide 300,000 by the number of kilocycles." The reason that kilocycles are coming into use and displacing meters is that the necessary separation of the frequency of transmitting stations to prevent interference is the same, no matter what the frequency may be. This necessary separation is variable and quite misleading when expressed in meters.

**Okanogan Power Line Completed.**—Completion of the power line connecting the Washington Water Power Company's main system with its new field in the Okanogan territory has been anounced. This construction includes 58 miles of 60,000-volt main transmission line, running from Coulee west to the Columbia River and north along the west bank of the river to Brewster. It will convey power from the main system of the Washington Water Power Company into the 33,000-volt lines of the Okanogan Valley Power Company, acquired by the Washington Water Power Company the first of the year. In addition to the 60,000-volt line 18 miles of 13,000-volt distribution line

was built into the Lake Chelan district, with arms extending on both sides of the lake.

**Five New Jersey Companies Are Consolidated.**—The merger of five corporations into the Central Jersey Power & Light Company, having an appraised valuation of $6,275,800 and serving 100,000 population in forty-two cities and municipalities, has been announced by the A. E. Fitkin Company of New York. In the amalgamation are the Morris & Somerset Electric Company, the Lakewood & Coast Electric Company, the Toms River Electric Company, the Lakewood Water Company and the Commonwealth Electric Company of Summit. J. H. Drake will be vice-president and general manager, with headquarters at Boonton, N. J.

**Mining Helps Hydro-Electric Expansion in Utah.**—That railway and metal-mining expansion in Utah will bring about a rapid development in hydro-electric projects is indicated by activity already under way in the southeastern part of the state. The Dixie Power Company is planning the construction of two new water-power plants and one steam plant to take care of an anticipated increased demand. The new sites, already in the company's control, are in the Pine Valley Mountains. It is believed that the present capacity of plants in operation, which is about 1,000 hp., will be entirely inadequate when the iron smelters now being constructed begin production. The new plants will bring the total capacity to about 6,000 hp. This will provide sufficient power to meet the present and future needs of the Cedar and Parowan Valleys.

**Diesel Electric Tanker Successful.**—Trials of the Standard Oil Company's first Diesel electrically driven tanker were completed off San Francisco last month and were eminently successful. The normal speed of the propeller is 130 r.p.m., but during the trial it was operated at about 145, and the load was less than 1,000 amp., whereas full load rating on the motors is 1,065 amp. The change from full speed ahead to reverse took from ten to twelve seconds. The tanker's propelling units consist of two General Electric 300-hp. motors mounted on the same base and with a common shaft and driving a single propeller. Energy is supplied by two General Electric 245-kw. direct-current generators with a 30-kw. exciter connected to each, each generator and exciter being directly connected to a 400-hp. six-cylinder Diesel engine.

**For Better Lighting in the Schools.**—Announcement of the personnel of the sectional committee which is to prepare a lighting code for the nation's schools under the auspices of the American Engineering Standards Committee, with the American Institute of Architects and the Illuminating Engineering Society as joint sponsors, is made by the Federated American Engineering Societies. Among the members are C. E. Clewell, representing the American Institute of Electrical Engineers; Ward Harrison, the National Electric Light Association; W. S. Little and M. Luckiesh, the Illuminating Engineering Society; M. G. Lloyd, the United States Bureau of Standards, and G. H. Stickney, the National Safety Council. Surveys and investigations are under way by various bodies. "Eyesight Conservation Day" has been inaugurated in several cities and systematic lectures to school children, particularly in New York and New Jersey, have been made a feature of the general plan.

# Associations and Societies

**New York Electrical Society.**—Officers of this society for the coming year, as unanimously selected by the nominating committee, will be: President, Philip Torchio; vice-presidents, Alfred Cane, E. H. Clarke and Harry E. Kidder; secretary, T. C. Martin; treasurer, T. F. Honahan.

**Los Angeles Section, A. I. E. E.**—The annual field day of the Los Angeles Section of the American Institute of Electrical Engineers was held Saturday, May 19. The party was taken by automobile on a trip of inspection to the new Laguna Bell 220,000-volt substation of the Southern California Edison Company and the Arcadia automatic substation of the Pacific Electric Railway. Following a dinner in the evening at the California Institute of Technology, the visitors visited its electrical and physical laboratories.

**Lehigh Valley Section, A. I. E. E.**—On May 24 Prof. Vladimir Karapetoff of Cornell University spoke before this section at Bethlehem, Pa., on "Recent Electrical Research." He emphasized the necessity of "continuity of effort" in order to obtain results that are worth while and the importance of having research workers who are employed not to solve this or that particular problem, but to become specialists in a certain class of phenomena, so that they can skillfully and intelligently handle any problem within that domain.

**Engineers' Club Formed at Hartford.**—With 908 charter members "signing up" during a short period of work devoted to organization, the Hartford (Conn.) Engineers' Club has been formed to promote friendly intercourse and professional advancement. A committee is at work on the problem of permanent quarters, and the following officers have been elected: President, Hiram Percy Maxim; vice-presidents, Frank P. Gilligan and Edward W. Bush; secretary, Kenneth B. Warner; treasurer, Henry R. Buck; councilors, Robert Charles Cole, William F. Brooks, F. C. Moore and S. F. Jeter.

**National Safety Council.**—The Engineering Section of the National Safety Council will hold its second meeting of the year at Detroit, in co-operation with the Detroit Safety Council, on June 12. In the morning the subject of safety in welding and cutting will be discussed by experts representing the three modern methods—electric, gas and and thermit—followed by a practical demonstration of the use of goggles to protect against the injurious visible and invisible rays and a general discussion in which the industrial safety engineers in the audience will have opportunity to get information on their own particular problems.

**Insull Addresses Chicago Electric Club.**—Before a well-attended luncheon of the Electric Club of Chicago on May 29 Samuel Insull, president Commonwealth Edison Company, gave a comparison of the central-station industry in 1902 and 1922. Whereas the total investment of all central stations in the United States in 1902 was $650,000,000 with an annual income of $85,000,000, the respective figures for 1922 were $5,000,000,000 and $1,000,000,000, he said. The energy output for the same period had increased from 2,500,000,000 kw.-hr. to 52,000,000,000 kw.-hr. President Insull also dealt with the power development in the northeastern section of Illinois, which he estimated would require by 1927 a maximum demand of 1,300,000 kw., since the present demand is about 789,000 kw. He earnestly advocated the spread of customer ownership of securities.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

California State Association of Electrical Contractors and Dealers—Dorner Lake, Cal., June 9-16.

Electric Power Club — Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

North Central Division, N. E. L. A.—Minneapolis, June 20-22. H. E. Young, Minneapolis General Electric Company.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association — Montreal, June 21-23. Louis Kon, 65 McGill College Ave., Montreal.

Southern Appalachian Water Power Conference — Asheville, N. C., June 25-27. J. A. Switzer, Knoxville, Tenn.

American Institute of Electrical Engineers —Annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

American Society for Testing Materials—Atlantic City, June 25-29.

Iowa Section, N. E. L. A. — Mason City, June 26-29. M. A. Linn, Des Moines Electric Co., Des Moines.

Associated Manufacturers of Electrical Supplies—New London, Conn., June 26-29. Frederic Nicholas, 30 East 42d St., New York.

National Council Lighting Fixture Manufacturers—Buffalo, June 26-28. C. H. Hofrichter, 233 Gordon Square Bldg., Cleveland.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13. D. L. Gaskill, Greenville.

New England Division, N. E. L. A.—Swampscott, Mass., Sept. 6-8. Miss O. A. Bursiel, 149 Tremont St., Boston.

Michigan Electric Light Association—Grand Rapids, Sept. 11-13. Herbert Silvester, Detroit Edison Co., Ann Arbor.

Rocky Mountain Division, N. E. L. A.—Glenwood Springs, Col., Sept. 17-19. O. A. Weller, 900 15th St., Denver.

Association of Iron and Steel Electrical Engineers — Buffalo, Sept. 24-28. J. F. Kelly, 513 Empire Bldg., Pittsburgh.

# Recent Court Decisions

**Judge's Characterization of Electrical Installation as "Mantrap" Not Prejudicial.**—A boy bathing was killed by contact with a live electric wire stretched on scows across a river for the use of a sand-pumping company, and the trial jury (Followill vs. Kansas Construction Company and Kansas Gas & Electric Company) found both the pumping company and the central-station company which furnished the energy guilty of wanton negligence. This verdict has been upheld by the Supreme Court of Kansas, which overruled exceptions taken to the charge of the trial judge and held that his colloquial characterization of an unguarded switch and uninsulated and sagging wires as a "mantrap" was not prejudicial to the defendants. (214 Pac. 430.)*

**May Taxes Be Levied to Distribute Electricity to Rural Community?**—Sustaining the lower court (Supervisors of Maricopa County vs. Faust) in finding unconstitutional an attempt of "Roosevelt Electrical District No. 3" to issue bonds under a defective state law intended to supersede others set aside by the courts, these bonds being for the alleged purpose of building transmission lines to supply residents of the district with electricity, the Supreme Court of Arizona refused to answer a question whether the distribution of electrical energy for domestic and power purposes to residents of a rural community fulfills such a public purpose that it may be done by means of funds provided by taxation. "An answer to that question in this case would settle nothing," the court said, "because it is not raised by the pleading and could not arise under the statute in question. Neither the act under which this district was organized nor the later one, under which it now assumes to act, deals with the distribution of electricity alone or even chiefly. None of these acts clearly and definitely defines the purpose for which districts are to be organized nor definitely limits the powers which are to be exercised." (214 Pac. 316.)

**Police Power and the Fourteenth Amendment.**—In Southern Bell Telephone & Telegraph Company vs. Town of Calhoun, a suit to restrain the enforcement of a state law requiring the installation of certain exchanges, the Federal District Court for the West District of South Carolina made a number of observations on the police power of the state in its relation to the Fourteenth Amendment of the United States Constitution, prohibiting confiscation. Among other things the decision said that the amendment does not prevent the state from exercising very extensive power in the regulation, taxation and policing of the business of a corporation, but permits a single foreign corporation to be expelled from the state by a special act and permits classification for the purposes of taxation to be resorted to; that in the matter of police regulation the powers of the state are exceedingly broad, and laws enacted for that purpose may be impolitic, harsh and oppressive without contravening the constitutional inhibition; that, however, a state legislature cannot single out a corporation, any more than a natural person, and subject it to burdens and liabilities which are not cast on others similarly situated, and that a joint resolution requiring a company to maintain telephone exchanges which it was not required to maintain by any provision of its charter or by any contract took the property of the corporation without just compensation. (287 Fed. 381.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Complicated Rates Should Be Avoided in Small Communities.**—In fixing rates for the Lapeer Gas-Electric Company, which combines steam heating with electric light and power service, the Michigan Public Utilities Commission dwelt upon the necessity of taking care not to make demand or connected load schedules for electric light and power in small communities so refined as to be unwieldy relative to the benefit secured by such refinement, where the cost of demand and connected load records will probably overbalance any benefit that might be gained as compared with a simpler rate schedule.

**Commission Champions Right to Fair Return.**—The Vermont Public Service Commission came out emphatically in its adjudication of an appeal brought by the city of St. Johnsbury against the New England Telephone & Telegraph Company against any contention that public utilities should be compelled to operate for less than a fair return. "That claim," the commission said, "if carried out, would result in the utter demoralization of all public service business and end in state ownership, a consummation devoutly to be avoided. Moreover, in considering whether a public service corporation is entitled to a return regard should be had for the people who have invested their money in the enterprise. Such a corporation may seem to be a great entity without soul or conscience, sucking the financial blood of its patrons for the mere pleasure derived from that process; but on further examination it will be found that the supposed sanguinary monster is but a legislative creation acting through its officers and agents for a large number of people in many walks of life who have paid into the corporation by way of stock investments sums of money for the double purpose of obtaining a revenue and aiding the enterprise. How long would the public continue to render such necessary financial assistance after a return was denied?" It was said further, in allowing a return of 6 per cent, which the commission termed moderate and conservative, that the maximum rate of return ought to be somewhat above what would be a fair average return, since the stockholders must stand their losses during poor years.

**Rate Base Should Include Cost of Construction in Progress.**—In defense of its inclusion in the rate base of the Pacific Telephone & Telegraph Company of a sum representing construction work in progress, the Department of Public Works of the State of Washington said: "Funds employed in construction work are as fully devoted to the public service as are funds invested in completed plant, in materials and supplies, or in the cash required to meet current expenditures. The necessity of an allowance for cash, materials and supplies and other items of working capital is recognized by all regulatory bodies and there is no question as to the propriety of permitting an earning upon these items in their final form when they appear as additions to the fixed capital accounts. Since 'construction work in progress' represents nothing more or less than cash and materials and supplies in their transitional stage between working capital and completed plant, it seems as clearly entitled to inclusion in the rate base as it was as working capital or as it will be as completed plant. There is, however, a further factor in this consideration, which is 'interest during construction.' Funds employed in construction work are entitled to a fair earning. If the funds be borrowed, the creditor is receiving an earning and the utility is suffering no loss since it is permitted to capitalize the interest it pays out. This capitalization creates a value upon which the utility is permitted to earn and which presumably can be sold if the plant changes owners. If the utility capitalizes interest on its own funds, there is an actual increase in its surplus. These facts must be recognized when considering the propriety of including 'construction work in progress' in the rate base. The rate of return from operations seldom coincides with the rate at which interest during construction is capitalized; furthermore, the applicant does not capitalize interest upon routine construction work requiring less than one month for completion. Therefore, the most equitable method of treatment appears to be to include 'construction work in progress' in the rate base and to include the interest accretions with operating income, which method acts as an automatic governor to compensate the ratepayer, if the rate of capitalization of interest be more, and the company if it be less, than the rate of return from operations."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## B. C. Adams in Toledo

Benjamin C. Adams, vice-president and general manager of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., operated by Henry L. Doherty & Company, has been made vice-president and general manager of the Toledo Edison Company and president and general manager of the Community Traction Company at Toledo, Ohio. Mr. Adams is succeeding Frank R. Coates, who was president and general manager of both companies. Mr. Coates is retaining the presidency of the Edison company. The change marks the withdrawal of Mr. Coates from most of his active duties with the Toledo properties in the assumption of larger duties with Doherty and the Cities Service Company in New York.

Mr. Coates came to Toledo on Dec. 5, 1911, and ever since then has been in charge of the Doherty interests in Toledo. Mr. Adams is a comparatively young executive and has come up through the Doherty organization, having been in St. Joseph about five years. He has worked on a number of other properties.

**T. B. Wilson**, treasurer and assistant general manager of the Louisville Gas & Electric Company, has been elected a vice-president of the company.

**R. F. Mullen**, superintendent of the meter department of the Indiana General Service Company at Muncie, has been promoted to the office of commercial manager.

**W. W. Finch**, with office at Indianapolis, is to supervise and direct the appliance and merchandise sales of all the subsidiaries of the Central Indiana Power Company.

**Charles Adams**, assistant chief engineer of the El Paso (Tex.) Electric Company, has been transferred to the Columbus (Ga.) Electric & Power Company as chief engineer.

**E. D. Freeman**, district superintendent of the Oklahoma Gas & Electric Company at Sapulpa, Okla., has been transferred to Oklahoma City to assist J. M. Brown, district superintendent there.

**W. S. Hodgson**, formerly assistant secretary and treasurer of the Utah Power & Light Company, is now in New York with the Electric Bond & Share Company. R. H. Jones succeeds Mr. Hodgson with the Utah company.

**G. W. Faller**, for several years general manager of the City Light & Water Company of Amarillo, Tex., a Doherty subsidiary, has been transferred to Denver to head the Doherty Training School, which is directed by the Denver Gas & Electric Light Company. Mr. Faller was formerly connected with the Denver company, and his recent transfer carries with it the title of assistant general manager. He has been succeeded at Amarillo by Ross Philips, formerly secretary of the Lincoln (Neb.) Gas & Electric Light Company.

## C. H. Champlain Works Manager at Sharon

C. H. Champlain, who has been assistant works manager at the East Pittsburgh works of the Westinghouse Electric & Manufacturing Company, has been appointed works manager of the Sharon plant, which the Westinghouse company has recently acquired from the Savage Arms Corporation. Mr. Champlain entered the employ of the Westinghouse company in 1895 and has devoted his time continuously to works management. During the world war he had charge of the manufacture of shells. On Jan. 1, 1916, he was transferred to the Springfield works of the Westinghouse Electric Company as general superintendent, in which position he had direct charge of the manufacture of Russian rifles and Browning machine guns. In August, 1919, he was transferred back to East Pittsburgh, being appointed general superintendent of those works, and in February, 1920, he was appointed assistant works manager, in which position he continued until his present appointment.

C. H. CHAMPLAIN

M. L. Fawcett, general foreman of the transformer department, has been made superintendent of the new works. Mr. Fawcett has been associated with the Westinghouse company for twenty-four years.

**A. L. Johnston**, formerly associated with the electrical engineering department of the West Penn system at Pittsburgh, is now connected with the Electric Bond & Share Company, New York.

**B. E. Torpen** has been appointed to the engineering staff of the city of Tacoma to fill the post of hydraulic engineer in connection with that city's Lake Cushman hydro-electric project.

**Roy H. Skill** has been made district manager for the Pacific Power & Light Company at Pomeroy, Wash. Mr. Skill has been associated with the company since 1917.

**L. A. Fiorani** has been appointed commercial manager of the utilities under the management of C. D. Parker & Company, Inc., Boston, with headquarters at the offices of the Union Light & Power Company, Franklin, Mass. Mr. Fiorani has been with the Union company for the past nine years.

**W. W. Arnett, Jr.**, has resigned his position of commercial engineer in the power department of the Monongahela-West Penn Public Service Company, Fairmont, W. Va., to join Brooke, Stokes & Company, bankers of Philadelphia. C. R. Huffman, local sales representative of the General Electric Company, has succeeded Mr. Arnett.

**Franklin N. Fernald** has been elected vice-president and treasurer of the Central Connecticut Power & Light Company, East Hampton, Conn., succeeding L. P. Perry, who recently resigned to become general commercial manager of the United Hudson Electric Corporation, Poughkeepsie, N. Y. Mr. Fernald was formerly a member of the power sales engineering staff of the Narragansett Electric Lighting Company, Providence, R. I.

**Herbert G. MacMurchy**, who formerly was in the engineering department of the Aluminum Company of America at Pittsburgh, has resigned and is now connected with the Phoenix Utility Company of Allentown, Pa. Mr. MacMurchy is electrical construction engineer in charge of the installation of electrical equipment in the new Fourth Street steam-electric station for the Memphis (Tenn.) Power & Light Company.

**E. E. Carpenter**, a member of the firm of Baker & Carpenter, engineers, of San Francisco, has been appointed chief electrical engineer for the British Columbia Electric Railway Company, Vancouver, B. C. Mr. Carpenter followed railway engineering for about seven years after his graduation from Stanford University in 1898. Subsequently he was chief construction engineer for Sanderson & Porter, on the Stanislaus River power development of the Sierra & San Francisco Power Company and chief engineer for the same firm in charge of design and construction of power development installation for the British Columbia Electric Railway Company at Jordan River, on Vancouver Island. As a member of the firm of Baker & Carpenter he has engaged in general consulting and executive practice.

# Manufacturing and Markets

## Need of a Climate Rating for Cities

**Standardization Greatly Affected by Atmospheric Conditions—An Important Factor in the Manufacture and the Purchase of Outdoor Equipment**

By J. R. Kearney

Sales Manager W. N. Matthews Corporation, St. Louis

IT IS a very difficult thing to develop standardization on a national basis when it comes to the construction of equipment that is used out of doors and is affected by atmospheric conditions. Utility men, in co-operation with electrical manufacturers, have been at work on this problem for years and have made material progress. Much has been learned, for instance, about the resisting qualities and the endurance of pole-line hardware, outdoor switches and other equipment. A very large amount of money has been spent each year in this development. But I doubt if any ten men from different sections of the country will agree on 50 per cent of this standardization. Each man feels that his conditions are different and that he must have more or can do with less protection than the standard provides, and in many cases he is right.

In other words, the life and performance of materials in outdoor service is more than anything else dependent upon the conditions in the air in the cities where they are used. And these conditions vary with the location of the city in relation to altitude, to the sea, and in regard to the atmospheric conditions which are caused by the effects of different classes of industries. It is impossible, for instance, to obtain the same results from the same equipment in Boston, Cleveland, Pittsburgh, Chicago, Minneapolis, Kansas City, St. Louis, New Orleans, Dallas, Denver, Salt Lake, Butte, Seattle, Portland, San Francisco and Los Angeles. But I believe that it would be a comparatively easy matter to decide upon standards for both materials and methods if these different cities were zoned or classified on the basis of the atmospheric or climatic conditions that obtain.

Consider Cleveland, for example. Atmospheric conditions are severe, owing apparently to the presence of many foundries, brass works and other industries which pour smoke and gases into the air. Rust is as active as in salt air. Aluminum can-

J. R. Kearney

not be used, say, in fuses, whereas in Kansas City or Minneapolis there is no trouble. Dampness from the lake also probably contributes to this condition; but, on the other hand, Buffalo is far easier on wood and metals, because, I assume, Buffalo has fewer industries that affect the atmosphere.

St. Louis would also be classified as severe. Aluminum can be used there fairly well, but galvanized-steel brackets will not stand up. There seems to be an acid in the air due to soft coal. New Orleans, Boston, Pittsburgh, Seattle and San Francisco would also be grouped in the same severe zone, because salt air or smoke or other conditions make them hard on outdoor equipment. In Pittsburgh there is an iron dust from the steel mills that settles on everything and makes a most severe condition. It causes a metallic coating to form on insulators, for instance, and makes necessary the use of oversize insulators. On 660-volt circuits common use is made of 3,300-volt material.

These cities are very hard on aluminum and galvanized steel, for they will last only a year under conditions where in many other cities they will stand up for twenty years. Brass cannot be used with any success at all, for it quickly becomes crystallized and brittle. In St. Louis there seems to be a very active electrolytic action. Wood also breaks down quickly.

Detroit, Memphis, Chicago, Columbus, Buffalo and Philadelphia would be classed as in an intermediate zone. Here brass suffers quickly by corrosion, but aluminum or galvanized steel will last, say, five years, and nothing like the difficulties that obtain in cities of the severe zone are experienced. Minneapolis, Denver, Salt Lake and Kansas City would be grouped in a mild zone, where aluminum is all right, and brass will stand up fairly well, and galvanized steel is good for ten years.

Based on the known record of the various materials used in outdoor equipment, practically every city in the country could be classified under one of three or more climatic zones, and standards could be developed to suit the several zone conditions and made very definite. The result would be that every utility company would know in just which zone it belonged and therefore just which class of materials it must buy to get good service and economy. Protection would come from a knowledge of zone conditions and men would buy to suit these conditions. It would save many lives, for many accidents come from the breakdown of some part that under the influence of a severe atmosphere some day turns what has always been a safe point into a point of danger. It would save much money in replacements and in labor. It would save many failures in service which are hurtful in public relations.

There are many people who are manufacturing equipment of this kind merely to sell and not for service. Under the plan proposed, whereby each buyer would know his zone and the standard demanded for it, a manufacturer of this type could not get a clearance for his goods that they did not measure up to. He could not sell in a zone where they did not qualify. It would save a large amount of waste and disappointment.

At present the manufacturer is free to urge his goods wherever there is a market. The location of Buffalo, Cleveland and Detroit along the lakes would seem to argue that what is good in one is good in all. Yet unseen chemical conditions in the air of Cleveland make it much harder on such equipment than the other two towns. If cities were rated, all this would be clear.

I think the manufacturers would welcome such a plan as they could then build their equipment to meet the different zone conditions. If this could be accomplished, the utilities in the different zones would pay the price for their materials in proportion to the mild or extreme zone condition which must be met. This would save many of the utilities a large amount of money and would not cause any more expense than at present in the more severe zones. If zoning was approved by the national standardization committees, the cities that would be placed in the severe zone would be willing to pay more money for their equipment than those situated in the milder zones.

I do not believe more than four zones would be required to cover the entire country, and possibly this could be well accomplished in three zones.

# Guiding Exports by Past Performances

**New Statistical Pictures Show the Changes in Demand by Foreign Countries for Seasons—How Manufacturers May Use Figures Advantageously**

BY S. H. DAY

Electrical Equipment Division, Bureau of Foreign and Domestic Commerce

BEGINNING with the first of January of this year, we started in the electrical equipment division of the bureau a system of tables or accounts on which are being recorded monthly figures showing both the quantity and the value of electrical exports from the United States by countries of destination.

A separate table is being made up for each of the sixty-five classes of electrical materials which find their way into foreign markets. The figures are being combined cumulatively so that in addition to showing the changes from month to month the latest entries give the total for the year up practically to the current month. This gives us a picture, so to speak, of the actual extent of the electrical business being done by American exporters in any foreign country with respect to all classes of materials, or, taking it from another angle, we can study the situation from the standpoint of a particular class of appliances or apparatus in all the foreign markets of the world. Thus a manufacturer of one single line of electrical appliance will be interested in the export business being done in his product in all countries of the world, and he may also want to know something about the electrical import business generally in some country where he has exceptionally good representation with a view to expanding his export line, undertaking an advertising campaign or possibly studying the bearing of sales of other materials upon the demand for his own product.

The two groups, motor-driven household devices and domestic heating and cooking appliances, have followed a similar trend during the last seven months. The total shipments increased last fall until the peak was reached in November, followed by a steady decline extending through January of this year. There was a holiday demand for these lines in 1922, which can undoubtedly be counted on regularly in the future. I wonder how many manufacturers of vacuum cleaners, washing machines, electric hair driers, vibrators, etc., take special steps to bring their product to the attention of foreign consumers during the December buying period. This may suggest a number of ways in which product can be pushed to take advantage of the holiday seasonal trade for these appliances.

From the standpoint of particular foreign markets, American motor-driven household devices were in steady demand in eight different foreign countries during the last seven months, while shipments of domestic heating and cooking appliances in substantial numbers reached twenty-five foreign markets during each month of the same period. Less seasonal variation is shown in our exports of domestic heating and cooking appliances for the reason that both hemispheres are included in the wide distribution of markets. Thus the absence of demand for heating appliances below the equator during the period from September until March is balanced by the need for them at this time of the year in the northern half of the world.

In motor-driven household devices Canada is our best foreign market, with Great Britain a close second. The Netherlands came next in importance, followed by Japan, Australia and Switzerland. The Latin-American countries took small amounts only, Mexico being the best customer. Cuba and one or two others are receiving small but fairly regular shipments of this class each month. Some other countries were intermittent buyers of rather large quantities, France being one of these. The same kind of demand is also apparent in Norway and South Africa.

There is a much broader range of foreign markets for domestic heating and cooking appliances. The figures for the last seven months show the seasonal demand in the Northern Hemisphere for heating equipment and, of course, reflect conversely the lack of need in the countries below the equator at this time of the year. The export business went first to Canada and second to Great Britain, the same as with motor-driven devices.

### SEASONAL DEMAND FOR FANS

A study of the foreign markets for electric fans on the basis of actual exports during the fall and winter months must at once take into consideration the seasonal nature of the demand for this appliance. The figures, therefore, show primarily the market possibilities of the Southern Hemisphere, together with the tropical regions where electric fans are used extensively throughout the year.

British India, which is our leading foreign market for electric fans, received more than $500,000 worth during December and January, the shipments during December being the largest for any of the seven months under consideration. The

market for fans in India is capable of almost indefinite expansion, although the question of sales channels is a difficult one and probably cannot be solved until enough business men settle in India to provide facilities for handling all American lines. The bureau is contemplating more extensive trade-promotion work in India, and American manufacturers of electric fans should receive direct benefit from this.

The increasing use of electrical appliances is following the rise in standards of living that is taking place in almost all countries of the world. This is evident even in those nations which are struggling with the after-effects of the war as well as in the more backward countries of the Orient. In fact, the war-torn regions are turning to electrical appliances as a means of economizing human effort, and labor-saving devices are beginning to play an important part in restoring the normal productivity of all those foreign countries.

American products since the war have achieved a splendid reputation in foreign markets, especially for quality and service, and I believe that American manufacturers of electrical appliances have a great opportunity before them if they will establish and perfect their selling channels in the important markets of the world and prepare for the permanent demand for their product which is sure to come.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

BUSINESS in the present electrical market has the appearance of much steadiness, with little indication of change within the next two weeks. For this week there are no spectacular price decreases or advances to report with the exception of a slight raise in motor prices in the Pacific Coast and Chicago territories and a 10 per cent marking up of porcelain in the East.

## New England Farm-Lighting Business Is on Gain

SALES of farm-lighting sets show healthy gains for May in the New England district, a representative distributor stating that this was the best month this year in that territory. Road conditions are now so close to normal that sales activities are no longer impeded by poor highways.

Deliveries are being made regularly out of Boston stocks, and prices are reported firm, with some tendency toward stiffening on account of increased material costs. Manufacturers of this class of equipment are working close to the full rating of their present plants. Expressed in number of units going into the field, probably at least one-third more are being shipped than was the case a year ago, and some distributors are probably exceeding this figure.

## Slight Improvement Shown in Eastern Purchases

A SLIGHT improvement in orders placed with jobbers was noted last week in the Eastern territory. There is an immense volume of electrical business under way, notwithstanding a continuance of the tendency toward a quieter market. Stocks are meeting current demands readily and prices are firm. A 10 per cent increase in porcelain was announced last week. Jobbers are gradually rounding out deficiencies in their stocks, although conservatism in buying is evident in long-time views. Railroad embargoes which have hampered Eastern electrical shipments are virtually lifted at the present time. General business is active, although labor troubles in the shoe industry and heavy pressure upon textile mills, due to higher wage scales, are causing some curtailment of production. Motor business reflects very keen competition at present, with some factory capacity idle and uneasiness as to prices. Appliances are moving fairly well, washers and cleaners being active.

## Street-Lighting Business Showing Healthy Growth

POPULAR demand for improved street lighting in many parts of the country is being reflected in a gratifying growth of business taken by representative manufacturers. This growth since the war has not been spectacular, although a reported appropriation of eight million dollars for municipal improvements, including street lighting at St. Louis, seems likely to cause a sudden jump in the equipment production curve in the near future.

Factory stocks are rather low at present, and the market for this class of apparatus is sufficiently active to absorb most of the production as it leaves the manufacturing departments. Prices are on the whole steady, and the supply of labor is not subject to the severe fluctuations experienced in many other lines.

Raw-material deliveries are somewhat slow and require close attention from the manufacturing angle. Full-time operation is meeting current requirements nicely, and the demand for the larger sizes of arc-lighting equipment keeps pace with the growth of series incandescent equipment sales, bearing in mind the adaptability of each to particular fields of service. Orders of representative street-lighting equipment makers appear to be well distributed throughout the country, the expiration of municipal contracts with central stations often furnishing occasions for the introduction of new and improved equipment.

## Motor Sales in San Francisco Are Excellent

BUILDING conditions are excellent save for an occasional shortage of building material. Permits totaled $4,928,986 for May as against $4,377,066 for May last year. Export business is at a low ebb with signs of even further depression. However, this condition is general and beyond the power of the community to correct. Crop indications are excellent. Plenty of new rolling stock has been ordered to prevent last year's losses from delayed shipments. Dealers' business is decidedly better. Refillable-fuse sales in smaller sizes seem to have been affected by sales of non-refillable, non-indicating types. Standardization of 40-deg. motors has necessitated careful handling of stock, for sales are excellent and apparently well distributed.

## Chicago Jobbers and Dealers Report Steady Business

CHICAGO electrical dealers and jobbers report a steady but quiet week of trade. Price advances announced this week included one from a manufacturer who increased motors of certain types 10 per cent. These motors were not included in the increase several weeks ago. The contracting game has slowed up, which accounts for the temporary lull in business. Building permits issued this week were 287, as against 294 for the same week last year. For May, 1923, the building permits totaled $33,721,330, as against $27,029,650 for May, 1922. Wage increases for fourteen open-shop building trades operating under the Landis award went into effect June 1 with increases ranging from 10 to 20 cents.

Sales of flatirons, vacuum cleaners and washing machines have been normal. Although numerous advertising sales campaigns are being started, no important increases in the sales of these commodities have been felt.

According to the Federal Reserve Bank of Chicago in its June report, labor shortage is reported by a number of firms. "Prompt deliveries of steel and steel products were hard to obtain," the report says, "with a few firms including lumber in the products not readily available. The steady increase in prices of raw materials, together with increased wages, has caused some firms to increase the price of their

goods. The demand for agricultural machinery and equipment was reported fairly good, but manufacturers express concern as to the future owing to increased prices."

### Conditions in Philadelphia Market Satisfactory

ACCORDING to reports from Philadelphia, dealers in electrical supplies are continuing to enjoy good business, except in the case of radio equipment, in the sales of which there has been a seasonal decline. The majority of orders are for immediate delivery, and in practically all cases it is possible to meet the demand.

Stocks generally are moderate and are decreasing. Some jobbers are having difficulty in obtaining delivery on equipment bought in New England, because of the freight situation there, and others report slow delivery on their orders for copper wire and conduit.

Prices are rising on many materials, and lists are higher than they were last month and a year ago. Quotations on specialties, however, have changed but little recently. Electrical contractors are busy on work placed some time ago, but they report that, while they are receiving numerous inquiries, few contracts are being closed at this time.

Collections in practically all cases are fair, and although they are little changed from last month, in some instances they are slower than they were last year.

### Electrical Goods Took Largest Part of 1922 Copper

COPPER consumed in the United States during 1922 is estimated by the American Bureau of Metal Statistics at 1,091,397,000 lb., compared with 904,753,000 lb. in 1921, 1,346,090,000 lb. in 1920 and 1,224,710,000 lb. in 1919. This consumption was divided as follows, the figures indicating the thousands of pounds:

| | 1922 | 1921 |
|---|---|---|
| Electrical goods*........ | 269,000 | 260,000 |
| Telephone and telegraph | 120,000 | 108,000 |
| Light and power lines†. | 97,500 | 66,000 |
| Wire and rods......... | 91,000 | 77,000 |
| Automobiles‡ .......... | 144,000 | 92,000 |
| Auto brake lining...... | 1,600 | 1,400 |
| Buildings§ ............ | 73,900 | 44,300 |
| Locomotives ........... | 5,030 | 5,890 |
| Railway cars .......... | 7,470 | 5,480 |
| Air brakes ............ | 5,600 | 3,350 |
| Ships, commercial§ .... | 6,180 | 38,000 |
| Ships, naval§ ......... | 170 | 9,900 |
| Bearings and bushings.. | 42,000 | 28,000 |
| Valve and pipe fittings.. | 20,000 | 11,500 |
| Ammunition ........... | 14,500 | 16,500 |
| Lubricators ........... | 5,500 | 1,600 |
| Condensers ............ | 4,800 | 4,000 |
| Fire-fighting apparatus.. | 3,100 | 2,300 |
| Agricultural machinery. | 500 | 720 |
| Cash registers ......... | 1,000 | 400 |
| Copper-bearing steel.... | 1,900 | 1,700 |
| Coinage ............... | 475 | 2,930 |
| Other uses¶ ........... | 95,000 | 72,000 |
| Manufactures for export. | 81,172 | 51,783 |
| Total ............... | 1,091,397 | 904,753 |

*Generators, motors, switchboards, lamps, etc., exclusive of telephone and telegraph purposes.

†Outside wiring only; does not include trolley lines.

‡Does not include electrical manufactures.

§Does not include electrical generators, motors, etc.

¶Includes rods, wire, sheet, tubes and all similar fabrications of copper for export.

### General Business Conditions Are Called "Spotted"

BUSINESS conditions in manufacturing and agricultural lines are characterized as "spotted" by the mercantile agencies. The situation is decidedly irregular, with the general trend, as regards new buying, in the direction of increased quiet, according to *Bradstreet's*.

In regard to the jobbing and retail trades "the increased quiet seems most marked in the eastern half of the cotton belt and in some West Central States," says the agency, "and is due mainly to weather conditions. In the eastern half of the South almost continuous rains were complained of as preventing crop work, retarding retail buying and rendering an already late season later still. Industry, owing to activity on old orders and the pushing to completion of building already planned, is relatively most active of all the great trade branches, but growing quiet in cotton goods manufacturing is noted East and South, and Eastern shoe manufacturing is also among the lines noting a seasonal shading off of industry. Mail-order trade continues active, an indication of farmers' ability to buy."

### Range Business Good in West and South

MANUFACTURERS of electric ranges report a decided increase in their total volume of business this spring as compared with last year, although trade in the East is somewhat spotty. One representative house is selling at least 33 per cent more ranges than a year ago, and the outlook for the summer is better than for some time. In some circles complaint is heard as to the lack of interest of central stations, especially in the East, in the electric range as a load builder, and one manufacturer said to the ELECTRICAL WORLD that the lack of experienced range users and salesmen in utility organizations is severely handicapping this development.

This producer feels that in the older sections of the country there is too much of a disposition to remain satisfied with the normal growth of central-station business; that the revenue possibilities of electric cooking are little realized in these quarters, and that too few utility men appreciate the fact that recent designs of ranges are being marketed at prices which compare very favorably with the retail prices of first-class gas ranges—a condition which has not obtained formerly and which has been long in coming, but which bids fair to remain permanent.

Orders from the West and South reflect the brighter spots on the sales manager's map in the range factory. No spectacular shipments are going forward at the moment, but buying is steadily increasing and it is difficult at this time to build up much in the way of factory stocks.

A disposition on the part of retailers to purchase ranges in lots of half a dozen rather than in single units can be seen here and there. Demonstration work is very active, and excellent results have come from recent fairs and exhibitions in which electric cooking has been thoroughly exploited.

Aggressive development of the heavier appliance business has not been generally characteristic of municipal lighting departments, but Reading, Mass., sold fifty ranges in eight weeks after a two-day electrical show. Factory conditions reflect good supplies of raw material and labor, broadly speaking. Manufacturers report they are ready to render a greatly increased service to the utility industry with this product, and current opinion has it that if the distributor and retailer will quicken the merchandising pace, a fine year's business will be recorded.

### English Electrical Exports Fell £21,801 in April

THE following are official values of electrical machinery, apparatus and material exported from England (a) during April, 1923, and (b) the aggregate figures from Jan. 1 to April 30, with the increase or decrease compared with the corresponding periods of 1922:

The total exports of electrical machinery, apparatus and material, other than insulated wire, were £1,022,779 during April, a decrease of £21,801 from April of 1922.

Electrical machinery, (*a*) £311,699 (decrease £138,790), (*b*) £1,327,415 (decrease £359,468); including railway and tramway motors, (*a*) £19,006 (increase £13,908), (*b*) £85,660 (increase £26,952); other generators and motors, (*a*) £171,000 (decrease £31,263), (*b*) £697,949 (decrease £303,504); and other electrical machinery, (*a*) £121,693 (decrease £121,435), (*b*) £543,806 (decrease £282,916); telegraph and telephone cables, submarine, (*a*) £37,128 (increase £14,108), (*b*) £186,804 (increase £81,533); other than submarine, (*a*) £100,606 (increase £38,793), (*b*)

### Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | $0.034 | $0.0326 | $0.0236 |
| Cold finished shafting, per lb. | 0.042 | 0.0406 | 0.032 |
| Brass rods, per lb. | 0.1850 | 0.1913 | 0.1466 |
| Solder (half and half), per lb. | 0.2862 | 0.2987 | 0.21 |
| Cotton waste, per lb. | 0.1231 | 0.1231 | 0.104 |
| Washers, cast iron (½-in.), per 100 lb. | 4.66 | 4.66 | 4.00 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 2.96 | 3.11 |
| Machine oil, per gal. | 0.349 | 0.349 | 0.40 |
| Belting, leather, medium, off list | 42½% | 42½% | 48½% |
| Machine bolts, up to 1-in. x 30-in., off list | 44¼% | 44¼% | 62¼% |

£320,991 (increase £113,442); telegraph and telephone apparatus, (a) £175,178 (increase £8,269), (b) £637,391 (decrease £70,587); other electrical wires and cables, rubber insulated, (a) £78,-935 (increase £29,004), (b) £375,461 (increase £179,957); with other insulations, (a) £81,557 (decrease £2,010), (b) £350,955 (decrease £70,071); carbons, (a) £1,151 (decrease £1,699), (b) £18,493 (increase £3,035); glow lamps, (a) £29,735 (decrease £9,443), (b) £105,768 (decrease £30,352); arc lamps and searchlights, (a) £576 (increase £167), (b) £2,265 (decrease £989); parts of arc lamps and searchlights (other than carbons), (a) £49 (decrease £497), (b) £295 (decrease £1,643); batteries, (a) £37,670 (decrease £4,320), (b) £181,127 (increase £33,224); electrical instruments (commercial and scientific) and electricity meters, (a) £29,585 (increase £1,038), (b) £107,902 (decrease £26,586); switchboards, (a) £18,504 (increase £5,319), (b) £45,484 (decrease £93,-566); other electrical goods and apparatus, (a) £120,406 (increase £38,-260), (b) £444,457 (increase £25,462).

## The Metal Market

CONDITIONS continue extremely quiet in the non-ferrous metal market, and prices generally are stationary or decreasing. Consumption continues as great as ever, with practically all metal users operating their plants at as near capacity as labor conditions will permit, but the unfilled orders on their books are not so great as they were a few months ago.

This is due not so much to an anticipated slackening in the demand for the ultimate product as to a feeling that commodity prices generally are likely to exhibit a downward trend and that it will be wise not to book orders for raw material farther ahead than necessary to insure deliveries in ample time for requirements.

Copper has been practically unsalable all week, and the larger producers almost without exception have done little or no business. Offers have been made at constantly decreasing prices day by day without tempting consumers in the least.

NEW YORK METAL MARKET PRICES

| | May 29, 1923 Cents per Pound | June 7, 1923 Cents per Pound |
|---|---|---|
| Copper, Electrolytic | 15.25 | 15.00 |
| Lead, Am.S.& R. price | 7.25 | 7.25 |
| Antimony | 8.00 | 8.00 |
| Nickel, ingot | 28.00 to 31.00 | 27.00 to 30.00 |
| Zinc, spot | 6.60 | 6.35 |
| Tin, Straits | 43.00 | 42.20 |
| Aluminum, 98 to 99 per cent | 26.00 | 26.00 |

Copper exports from United States in March totaled 67,122,745 lb. The principal items were: Refined ingots, bars, etc., 57,185,756 lb.; plates and sheets, 724,648 lb.; rods, 5,639,241 lb.; bare wire, 521,337 lb.; insulated wire and cable, 1,839,215 lb.; other manufactures, including pipes and tubes, 890,-801 lb.

# Activities of the Trade

Devoted to News of the Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## General Electric May Sales Were Heaviest in Company's History

May sales by the General Electric Company broke all previous records. Its bookings for the first quarter of this year are at the annual rate of about $320,000,000, while billings are averaging about $25,000,000 monthly. At a basis of $300,000,000 for the year, sales billed would exceed the total of last year by nearly $100,000,000. Bookings in that period totaled $242,739,527.

Unfilled orders amount to about $100,-000,000, as compared with $76,220,000 at the end of last year. This total shows the tremendous volume of business which the company was offered in the first five months.

The company's cash position shows little change from Dec. 31, when its cash and government securities amounted to $85,341,539. Inventories have shown a disposition to increase owing to the larger orders. These footed up $75,334,-562 on Dec. 31.

Earnings during this year are expected to run ahead of the preceding twelve months, when $14.86 a share was shown on the $175,624,746 outstanding common stock.

## Link-Belt Company Changes

The Link-Belt Company of Chicago and Philadelphia announces that L. M. Dalton has succeeded E. J. Burnell as manager of the Boston branch office. Mr. Burnell resigned his post to enter business.

The Cleveland office of the Link-Belt Company has moved from room 429 to room 329, and the building in which it has so long found quarters has again changed hands and name. In the future the address of the Link-Belt Cleveland office will be 329 Rockefeller Building.

## Steiner Electric Changes Location

Upon the consolidation with the Faden Electric Company on May 1, the Steiner Electric Company moved from 115 North Wells Street to 210 South Desplaines Street, Chicago. Upon this consolidation the company was incorporated for $100,000, since the former organization had been a partnership. The new officers are: Harold W. Steiner, president; Alex Faden, vice-president; George F. Steiner, sales manager and secretary, and M. Loehr, assistant secretary.

George F. Steiner says this new location affords the company double the floor space it had previously, and that upon the acquisition of the Faden company's stock electrical fixtures will be handled. For this he has been arranging a display room comprising one-eighth of the entire floor space of the company. A new arrangement of stock layout has been made to facilitate the disposal of electrical goods for city trade.

## Wagner Motor and Control Apparatus Prices Increased

The Wagner Electric Corporation, St. Louis, on May 21 increased its prices of motors and control apparatus as follows:

| | Increase, Per Cent |
|---|---|
| All single-phase motors larger than 3 hp. | 10 |
| All "Bw" type motors | 5 |
| Twenty-five-cycle motors, types "BP," "RP," "BM" and "BR" | 10 |
| Slip-ring control apparatus | 10 |

All dealers and agents were notified that these prices were to be effective immediately.

## Westinghouse Acquiries Savage Arms Plant at Sharon

Announcement is made of the recent acquisition of the plant of the Savage Arms Corporation at Sharon, Pa., by the Westinghouse Electric & Manufacturing Company. A large force of workmen is now engaged in remodeling and equipping the plant for the manufacture of transformers. It is expected that the plant will begin operation next fall.

The transformer division of the East Pittsburgh works of the Westinghouse company will be transferred to Sharon, according to officials of the Westinghouse company, and three thousand persons, including a large number of girls and women, will be employed in the new Westinghouse plant when it begins operation. The acquisition of the Sharon plant was necessitated by the increasing business in transformers and the need for extending the facilities of production and manufacture of this type of electrical apparatus.

C. H. Champlain, who has been assistant works manager at the East Pittsburgh works, has been appointed works manager of the Sharon plant, and M. L. Fawcett, general foreman of the transformer department, has been made superintendent of the new works. Both officials are now engaged in directing the work of fitting the new plant for the manufacture of transformers.

All types of transformers, from the very smallest to some of the largest in the world, eventually will be made at the Sharon plant, and this will involve the transportation and installation of a large amount of machinery and testing equipment. Among the operations to be performed in the construction and

assembly of transformers are the drawing and forming of steel for tanks, the winding of coils, stamping of metal for cores, the manufacture of insulating bushings and the testing of the complete units.

### Black & Decker Make Second Price Reduction This Year

The Black & Decker Manufacturing Company, Towson Heights, Baltimore, announces a further reduction in prices, effective June 1, as follows:

| | Former Price | Present Price |
|---|---|---|
| ½-in. portable electric drill | $82 | $75 |
| Heavy-duty ½-in. electric drill | 100 | 90 |
| ⅝-in. portable electric drill | 105 | 95 |
| 9/16-in. portable electric drill | 105 | 95 |
| ⅞-in. portable electric drill | 125 | 110 |

This makes the second reduction in prices that this concern has made this year. Its reduction on Jan. 13 was as follows:

| | Former Price | Present Price |
|---|---|---|
| ¼-in. portable electric drill | $49 | $28 |
| Special ½-in. electric drill | 106 | 88 |
| Bench drill stand | 45 | 38 |
| Post drill stand | 50 | 44 |
| 6-in. electric bench grinder | 70 | 48 |

### Makers of "Chromalox" Win Heating-Element Equipment Suit

The United States District Court for the Northern District of Ohio, Judge D. C. Westenhaver presiding, on May 11 rendered a decision in the patent controversy between Edwin L. Wiegand of Pittsburgh and the Dover Manufacturing Company, Dover, Ohio. In this decision the court upheld thirteen of the fourteen claims of the Wiegand patent, covering equipment used in the manufacture of embedded heating elements. The court also refused to hold invalid the Wiegand article and process patents 1,154,953 and 1,136,076 respectively.

The court held that the Dover Manufacturing Company has a limited shop right to manufacture and sell electric sadirons containing certain of Wiegand's inventions made during his employment by the Dover Manufacturing Company from 1911 to 1914. This, however, does not permit the Dover Manufacturing Company to use the Wiegand patents on the improved processes and equipment subsequently developed and used by the Edwin L. Wiegand Company in the manufacture of its line of "Chromolax" heating units, of which it is the only authorized source.

### George Drake Smith Resigns from Steinmetz Vehicle

George Drake Smith has announced his resignation as sales manager of the Steinmetz Electric Vehicle Company. Mr. Smith has organized an investment business in New York City and will specialize in public utility securities. He has recently been elected a director of the American Drawn Steel Company, Erie, Pa.

### Uehling Instrument Appointments

The Uehling Instrument Company, Paterson, N. J., manufacturer of $CO_2$ recorders and draft and vacuum gages, has just made two agency appointments, namely the Amsler-Morton Company, Fulton Building, Pittsburgh, for western Pennsylvania, and John A. MacDowell, 2039 Railway Exchange Building, St. Louis, for eastern Missouri and southern Illinois.

H. R. N. Johnson, who formerly represented the Uehling Instrument Company in Minnesota and the Dakotas, has joined the W. P. Nevins Company, 120 South Ninth Street, Minneapolis, Minn., which company is now the official Uehling representative in the territory mentioned.

### W. N. Matthews Reorganization Is Effected Under Missouri Laws

The W. N. Matthews Corporation, St. Louis, manufacturer of electrical specialties, has just been organized under the laws of Missouri to take over the business of W. N. Matthews & Brother, Inc., a New Mexico corporation. The capital stock of the Missouri corporation will consist of 5,000 shares of $100 par value 7 per cent cumulative preferred stock and 100,000 shares of $1 par value common stock. The business of W. N. Matthews & Brother, Inc., will be taken over in its entirety by the W. N. Matthews Corporation and the old company dissolved.

The officers of the new company are: W. N. Matthews, president; Claude L. Matthews, secretary and treasurer, and C. C. Fredericks, vice-president and general manager. James R. Kearney will be manager of sales for the electrical division, and Louis P. Murray manager of sales for the mechanical painting division.

W. N. Matthews & Brother, Inc., was established in 1899 by W. N. Matthews, who prior to that time was in the electrical supply jobbing business and was one of the organizers of the Electrical Supply Jobbers' Association. Claude L. Matthews became the junior partner in 1901, after spending a year and a half in the employ of the Packard Electric Company, Warren, Ohio. James R. Kearney joined the organization in 1905 as a salesman, after resigning his position as superintendent of construction of the Topeka Edison Company.

Mr. Kearney of the electrical division has a sales organization of fifteen representatives reporting to him. These men are: W. J. McIlvane, 30 Church Street, New York City; George G. Young, Bourse Building, Philadelphia; H. Van Rosen, 294 Washington Street, Boston; H. B. Parke and J. A. Jaques, 305 Seventh Avenue, Pittsburgh; H. C. Biglin, Atlanta; D. C. Griffiths and D. B. Graze, Marshall Building, Cleveland; J. T. Pearson, 1525 Dime Savings Bank Building, Detroit; H. L. Brueck, 29 South Desplaines Street, Chicago; J. E. Sumpter, 222 Security Building, Minneapolis; W. M. Watters, 1319 Main Street, Kansas City, Mo.; O. H. Davidson, 1633 Tremont Street, Denver; R. S. Wakefield, 324 Interurban Building, Dallas; D. Schneider, Kenyon Building, Louisville, and Ben C. Holst, Furniture Exchange Building, San Francisco.

### National Lamp of Cleveland Has Arranged to Close Warren Plant

The National Lamp Works of the General Electric Company, Cleveland, have arranged for the closing of their plant at Warren, Ohio, and operations will be transferred to the main works at Cleveland. It is proposed to remove equipment also to this location. The change is expected to be made on July 16. The Warren plant has been giving employment to about four hundred operatives. It was started twelve years ago.

The company recently shut down its plant at Shelby, Ohio, previously operated as the Shelby Lamp Division, after twenty-five years' continuous service. The Youngstown and Niles (Ohio) plants, it is said, will be continued as heretofore, the latter works being devoted to bulb production.

**The Bakelite Corporation**, 8 West Fortieth Street, New York City, manufacturer of electrical insulation products, has acquired the former plant of the Lake Erie Foundry Company, Painesville, Ohio, for new branch works.

**The Gifford-Wood Company**, conveying machinery, Hudson, N. Y., announces the removal of its Buffalo office to Pittsburgh, People's Bank Building.

**The Simplex Wire & Cable Company**, 201 Devonshire Street, Boston, has awarded a contract for a one-story, 51-ft. x 36-ft. factory on Pacific Street, Cambridge, Mass.

**The Fulton Container Company**, Nitro, W. Va., recently organized by Charleston (W. Va.) interests, will build a plant for the manufacture of electric battery containers, under a special process, and kindred equipment. It will cost $40,000. David A. Jayne is president of the company.

**The American Insulator Corporation**, New Freedom, Pa., is installing machinery and other equipment in a manufacturing plant recently leased from the Danbury Industrial Corporation, Danbury, Conn.

**The Western Electric Company**, 195 Broadway, New York City, will soon take bids on a general contract for the initial unit of its new cable and instrument plant on property recently acquired on the Newark Meadows, Kearney, N. J., to cost approximately $500,000.

**The Electric Apparatus Company**, Parkesburg, Chester County, Pa., has been organized to manufacture electrical apparatus. Plans for the future are not definitely formed. Horace A. Beale, Jr., is president, H. B. Wiese secretary, and E. H. Brodhead vice-president and general manager.

## Foreign Trade Notes

NEW ELECTRIC PLANT IN SOUTH AFRICA.—The construction of a large power plant near the Witbank station is contemplated by the Victoria Falls & Transvaal Power Company, to cost about £1,000,000. The proposed station will be equipped with three electric generating units of 20,000 hp. each.

ELECTRIC PUMPS PROPOSED FOR GALICIAN OIL FIELDS.—Developments are in progress in the Galician oil fields looking to the substitution of electricity for steam for operating pumps. A power station has already been erected by the Premier Oil Company (French) at Boryslaw with this end in view. If the present experiments show economy of operation, it is expected that the change will become general.

PROPOSED HYDRO-ELECTRIC DEVELOPMENT IN LATVIA.—The construction of a hydro-electric power plant on the Dunn River at Kokenhusen for the distribution of electricity in Lettonia is under consideration by the government.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in London, England (No. 6,649), of head sets, radio equipment, etc.

Purchase is desired in Nancy, France (No. 6,658), of power-plant specialties and electrical maintenance supplies.

Purchase or agency is desired in Havre, France (No. 6,600), of enameled wire.

An agency is desired in Bayamon, Porto Rico (No. 6,634), of wire sockets, etc.

Purchase is desired in Bergen, Norway (No. 6,654), of pyrometers for ovens for malleable works.

Agency and purchase is desired in Santos, Brazil (No. 6,642) for electric washing machines.

TRANSFORMERS FOR MELBOURNE, AUSTRALIA.—Tenders will be received by the Victorian Electricity Commission, Melbourne, Australia, until Aug. 25 for thirty-one 22,000-volt transformers ranging from 15 kva. to 750 kva.

ELECTRIC EQUIPMENT FOR ALLAHABAD, INDIA.—Tenders will be received by the Public Health Department, Allahabad, India, until July 3 for equipment for pumping plant, consisting of oil engines, generators, motors and centrifugal pumps, at Fyzabad in connection with the water-supply scheme.

STORAGE BATTERIES, SWITCHES, ETC., FOR SYDNEY, AUSTRALIA.—Tenders will be received by the City Council, Sydney, Australia, until Nov. 19 for storage batteries, regulating switches, copper connections, charging boosters and switchgear, under Specification 736.

## New Apparatus and Publications

ELECTRIC POLE AND LINE HARDWARE.—The St. Louis Malleable Casting Company, St. Louis, is distributing catalog No. 500, covering its pole and line hardware and electrical specialties for railway, lighting, power, telephone, telegraph and mining companies.

ELECTRIC LANTERN.—The Embury Manufacturing Company, Warsaw, N. Y., has placed on the market the "Embury Supreme" electric lantern. It carries three standard unit-cell batteries.

INDOOR EQUIPMENT.—Bulletin No. 222 issued by Schweitzer & Conrad, Inc., 4431 Ravenswood Avenue, Chicago, describes and list its indoor equipment, including high-voltage apparatus.

LIGHTING UNIT.—A new lighting unit, "Glassteel Diffuser," for commercial and industrial lighting has been developed by the Benjamin Electric Manufacturing Company, 847 West Jackson Boulevard, Chicago.

CIRCUIT BREAKERS.—Bulletin No. 313 issued by the Automatic Reclosing Circuit Breaker Company, Columbus, Ohio, covers its automatic reclosing sectionalizing circuit breakers for direct-current distribution systems.

GASOLINE DRILL.—A gasoline impact drill of the air-hammer type is now manufactured by the Pennsylvania Gasoline Drill Company, Land Title Building, Philadelphia.

SELF-STARTERS.—Bulletin No. 6,106 issued by the Cutler-Hammer Manufacturing Company, Milwaukee, covers its time-limit acceleration type of direct-current self-starters, up to and including 200 hp.

ELECTRIC WASHING MACHINE.—The Apex Electrical Distributing Company, Cleveland, has placed on the market a new electric washing machine, known as the "M-2 Rotarex" washer.

CARBON BRUSHES.—The Universal Carbon Company, Dundee, Ill., is distributing a bulletin listing the prices of its carbon brushes. It also contains specifications as to the use of the various brush grades.

STEAMER AND THERAPEUTIC LAMP.—A therapeutic lamp which can be used in hairdressing establishments for facial and scalp treatment has been developed by the R-No-Mae Company, Inc., 57 Fifth Avenue, New York City.

PORTABLE ELECTRIC DRILL.—The Independent Pneumatic Tool Company, 600 West Jackson Boulevard, Chicago, has brought out a portable electric drill, "Thor," of $\frac{3}{16}$-in. capacity.

VIOLET-RAY MACHINES.—The Parco Manufacturing Company, 211 High Avenue, Cleveland, has placed on the market a line of violet-ray machines, consisting of four models.

BELL-RINGING TRANSFORMER.—The Thordarson Electric Manufacturing Company, 500 West Huron Street, Chicago, has placed on the market a bell-ringing transformer with a steel case.

INSULATING COMPOUND.—An insulating compound especially adapted for radio parts has been developed by the Marlanite Company, Barberton, Ohio.

ELEVATOR CONTROLLERS.—The Cutler-Hammer Manufacturing Company, Milwaukee, has issued bulletins Nos. 9,843 and 9,872, covering its elevator controllers for two-speed alternating-current motors, the former for squirrel-cage-type motors, and the latter for slip-ring-type motors.

PUSH-BUTTON.—A line of push-buttons in which all parts are made of metal except the terminal piece and button has been brought out by the Danbury Electric Manufacturing Company, Danbury, Conn.

MOTOR-GENERATOR SET.—The Commercial Electrical Supply Company, St. Louis, has placed on the market a motor-generator set for operating bells, horns and mine signals and for charging storage batteries.

SIGN RECEPTACLE.—The Gordon Electric Manufacturing Company, Waterville, Conn., has placed on the market a sign receptacle for ceiling holder work.

THERMAL RELAY.—The Automatic Reclosing Circuit Breaker Company, Columbus, Ohio, is distributing bulletin No. 402, describing its type "TR" thermal relay for control circuits not exceeding 6 amp. at 125 volts or 3 amp. at 250 volts. The company has also issued instruction sheet No. 36, giving instructions and part list for the type "J" reverse-current relays.

BOX-TOE STEAMER.—An electric box-toe steamer for treating leather in shoe factories has been placed on the market by the Watlow Electric Manufacturing Company, 1409 Pine Street, St. Louis.

PLATE HEATER.—The Even Heat Electric Company, 2429 Canton Avenue, Detroit, has added a single-plate heater for either 600 watts or 1,000 watts to its line of electrical appliances.

## New Incorporations

THE MISSISSIPPI POWER & LIGHT COMPANY, Calvert Building, Baltimore, Md., has been incorporated by George S. Newcomer, Douglas H. Rose and James Cary, 3d.

THE ARKANSAS-MISSOURI POWER COMPANY, St. Louis, Mo., has been incorporated with a capital stock of $350,000 by J. M. Moore, E. J. Badman and others.

THE INLAND POWER & LIGHT COMPANY, Portland, Ore., has been incorporated with a capital stock of $100,000 by Henry S. Gray, C. Larison and D. A. Evkman.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

PRESQUE ISLE, ME.—Plans, it is understood, are under consideration to increase the output of the electric plant of the Gould Electric Company.

GORHAM, N. H.—Work will soon begin on the foundations for the proposed two-unit hydro-electric plant to be built on the Androscoggin River by the Twin State Gas & Electric Company, to cost about $275,000.

BOSTON, MASS.—The Boston Insulated Wire & Cable Company plans to built an addition to its power house.

CAMBRIDGE, MASS.—The Cambridge Electric Light Company has issued $468,000 in capital stock, the proceeds to be used for extensions and improvements.

NEW BEDFORD, MASS.—The New Bedford Gas & Edison Light Company has secured permission to issue $1,145,000 in bonds, part of the proceeds to be used for extensions and improvements.

WORCESTER, MASS.—The New England Power Company has issued $1,800,000 in bonds, part of the proceeds to be used for its proposed hydro-electric power project on the Deerfield River.

NEW BRITAIN, CONN.—The Board of Public Works contemplates the purchase of material for the underground conduit system on Broad Street, consisting of 25,000 ft. of 3½-in. single-tile duct, 25,000 ft. of 4-in. and 15,000 ft. 3½-in. fiber duct, fifty manhole fromes and 1,600 barrels of cement. The cost of the material is estimated at $25,000.

NEW HAVEN, CONN.—A permit has been issued to the Connecticut Company for an addition to its power house on Grand Avenue, to cost about $20,000.

## Middle Atlantic States

BATAVIA, N. Y.—The Western New York Utilities Company has taken out a new charter with capital stock of $950,000, allowing it to consolidate the company of the same name with the Genesee Light & Power Company. Extensions will be made in present power plants and systems.

FORT TOTTEN, N. Y.—Bids will be received by the Quartermaster, Torpedo Depot, until June 20, for 10 miles of submarine cable, one-conductor rubber-insulated and armored. (Post Artillery Specification 48-3.)

WESTVILLE, N. J.—Bids will be received by the Borough Council until June 20 for construction of a sanitary sewerage system, including an electrically operated sewage-pumping station.

CHESTER, PA.—A power house and machine shop will be erected in connection with the proposed brick-manufacturing plant to be erected at Bethel Road and the Baltimore & Ohio Railroad Company by a company now being organized by Samuel Addis, an official of the Chester Lumber & Coal Company. The cost of the plant is estimated at about $100,000.

FREEMANSBURG, PA.—The Pennsylvania Power & Light Company plans to build substation near here, to cost about $250,000, to supply electricity at Bethlehem and vicinity. A steel-tower transmission line will also be built.

HONESDALE, PA.—The Consolidated Power, Heat & Light Company, it is reported, is planning extensions and improvements to its system. The property was recently taken over by N. M. Seabrease & Company, Land Title Building, Philadelphia.

KINGSTON, PA.—The Glen Alden Coal Company, West Pittston, plans to build power house, 85 ft. x 90 ft., at its local Pettebone Colliery.

MILLERSTOWN, PA.—The Millerstown Borough Electric Corporation has been granted a franchise to install an electric light and power system.

PHILADELPHIA, PA.—The La France Textile Company, 4423 Frankford Avenue, plans to erect a power house at its mill.

PHILADELPHIA, PA. — Bids will be called for at once by the local supply officer, Navy Department, for four induction motors. (Aero Req. 1234.)

TWIN ROCKS, PA.—The C. A. Hughes Coal Company, Altoona, contemplates the installation of electric power equipment at its local properties, recently acquired from the Quality Coal Company.

LONACONING, MD.—The Georges Creek Coal Mining Company contemplates the installation of electric power equipment, with additional mining machinery, at the former properties of the American Coal Company, recently acquired, to cost $200,000. L. F. Gerdetz is engineer.

WESTON, W. VA.—The Weston Electric Light, Power & Water Company contemplates extending its transmission lines to furnish service at Halesville and vicinity.

WHEELING, W. VA.—The West Virginia Match Company, recently organized, plans to erect a power house at its proposed local plant, to cost about $100,000.

NEWSOMS, VA. — Contract has been awarded by the Newsom Light Company to construct a distributing system in the town and a transmission line.

NORFOLK, VA.—Plans are under way for the installation of an ornamental lighting system on Plume Street, consisting of thirty-four standards, to cost about $7,000.

YORKTOWN, VA.—Bids will be received by the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 20, for power-plant equipment for the Yorktown naval station. (Specification 4826.)

WASHINGTON, D. C.—Bids will be received by the Department of Agriculture until June 12, for one transformer.

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until June 15, for sixty dynamotor units (Proposal 14739-1 CP); also, until June 13, for 32,000 ft. submarine cable and cable reels (proposal 14623-1 CP).

## North Central States

DETROIT, MICH.—The Detroit Edison Company has issued $8,000,000 in bonds and $9,000,000 in capital stock, part of the proceeds to be used for extensions to its system. A transmission line will be erected to connect with the system of the Great Lakes Power Company.

GRAND RAPIDS, MICH.—The La Mar Pipe & Tile Company contemplates the installation of a power house at its proposed plant at La Mar, near Grand Rapids. J. Kent Wilson is general manager.

LIMA, OHIO.—The Ohio Power Company has purchased a site in Bath Township, where it will erect a substation, to cost about $100,000.

ORIENT, OHIO.—Bids will be received by the Department of Public Welfare, Administration Building, Columbus, until June 16 for furnishing material for a tunnel, piping and electric conduit in tunnel at the Institution for Feeble-Minded at Orient.

TORONTO, OHIO. — Preliminary work has been started for the proposed electric power project of the Pennsylvania-Ohio Power & Light Company on the Ohio River, near Toronto, to cost about $6,000,000. James D. Andrew, engineer, representing Stevens & Wood, Inc., is in charge of the work.

ELIZABETHTOWN, KY.—The Kentucky Utilities Company, Louisville, plans to extend its transmission line from Elizabethtown to Camp Knox., to cost about $25,000. G. T. Bogart is engineer for the company.

PINEVILLE, KY.—The Kentucky Utilities Company has awarded a contract to the Foundation Company, New York, for foundations and superstructure for its proposed local generating plant, to cost about $250,000.

GOSHEN, IND.—The Interstate Public Service Company, which controls the Hawks Electric Company, plans to double the capacity of the generating plant, at a cost of about $200,000. Arrangements are being made by the company to erect a transmission line to the proposed hydro-electric plant to be built at Mottville, Mich.

INDIANAPOLIS, IND.—Electric power equipment will be installed in the proposed milling plant to be constructed by the Perins Mills, Inc., Emerson Avenue to cost about $250,000.

MOUNT VERNON, IND.—The Southern Indiana Gas & Electric Company has applied to the Public Service Commission for permission to purchase the property of the Mount Vernon Electric Light & Power Company.

PEORIA, ILL.—The Illinois Central Light & Power Company has awarded a contract to the Foundation Company, New York, for foundations and superstructure for a local generating plant, to cost about $600,000.

ROCKFORD, ILL.—Extensions are being made to the plant of the Rockford Electric Company, to cost about $700,000. The work will include an addition to power station, installation of a new boiler, a 3,000-kw. generator, 3,500-hp. engine, switchboard, etc.

ASHLAND, WIS.—Steps have been taken by the Lake Superior District Power Company to secure the right-of-way for the erection of its proposed high-tension transmission line from Ashland to Hurley, a distance of about 35 miles.

FOND DU LAC, WIS.—Preliminary plans are being prepared by R. E. Schmidt, Garden & Martin, engineers, 104 South Michigan Avenue, Chicago, for power house and equipment, to cost about $45,000, for the St. Agnes Hospital.

MADISON, WIS.—Plans are being prepared by the Chicago & Northwestern Railway for a power house and machine shop, to cost about $150,000. A. W. Bowers, 201 South Blair Street, is divisional agent.

MASON, WIS.—The Mason Light & Power Company is planning to change its distribution system from direct to alternating current. Improvements will also be made to the power house, dam, etc.

MENASHA, WIS.—The City Council is considering the installation of an ornamental lighting system for a distance of 3 miles along the state highway from Menasha to Appleton. It is proposed to have the cities of Menasha and Appleton and the town of Menasha co-operate in connection with the installation and upkeep of this system.

SHEBOYGAN, WIS.—Extensive improvements are being made to the local electric plant by the Eastern Wisconsin Electric Company, to cost about $180,000. The work will include an addition to power station, the installation of a new boiler and accessories. Orders, it is understood, have been placed for the equipment.

CAMERON CITY, MO.—The City Council is considering calling an election to vote on the proposal to issue $150,000 in bonds, of which the proceeds of $133,300 will be used for improvements to the electric light and water systems.

JOPLIN, MO.—A special election will be held on June 19 to vote on the proposal to issue $80,000 in bonds for improvements to the street-lighting system and the city fire department.

STOCKTON, MO. — G. B. Steward and associates are organizing a company to construct and operate a hydro-electric power plant on the Sac River, with transmission system for service in this district. Russell & Axon, 404 McDaniel Building, Springfield, Mo., are engineers.

MADISON, S. D.—Steps have been taken by the Kiwanis Club for the erection of a transmission line from the city to Lake Madison to supply electricity to the Chautauqua camping grounds.

ADAMS, NEB.—The proposal to erect a transmission line has been approved by the voters. The Town Council will enter into a contract with the Blue River Power Company, Seward, to furnish electricity to operate the municipal electric system.

OMAHA, NEB.—The Metropolitan Utilities District will build an addition to its power house at Florence, including the installation of additional equipment.

WINFIELD, KAS.—The installation of electrically operated pumping machinery in connection with extensions to the municipal waterworks is under consideration by the City Commission, and $112,000 in bonds have been voted.

## Southern States

LENOIR, N. C.—The State Legislature has appropriated $300,000 for improvements to the Appalachian Training School, to include a larger power plant, a laundry, cold storage, building for physical educational work, etc.

SPARTANBURG, S. C.—The Arcadia Mills., Inc., plan to build a power house in connection with their proposed new textile mill, to cost about $200,000.

SUMTER, S. C.—The O. L. Williams Veneer Company contemplates the construction of a power house at its proposed local factory, to cost about $100,000.

BLOUNTSTOWN, FLA. — The Florida Orchard & Packing Company, Thomasville, Ga., plans to build a power house in connection with a new fertilizer manufacturing plant near Blountstown, to cost about $100,000.

GROVELAND, FLA. — The Groveland Light, Power & Ice Company has completed plans for the construction of a power plant to cost about $80,000.

ATHENS, TENN.—The Tennessee Electric Power Company, Chattanooga, has been granted a franchise to construct an electric power plant and distributing system in Athens.

CHATTANOOGA, TENN. — The City Water Company plans to install electrically driven pumping machinery, auxiliary apparatus and new automatic stokers at its plant at Citico, near Chattanooga.

KNOXVILLE, TENN.—Plans are being prepared for a new power house for the Tennessee School for the Deaf and Dumb, to cost about $55,000.

MEMPHIS, TENN.—Plans for extensions and improvements to the municipal waterworks, for which $1,500,000 in bonds have been voted, include electrically operated pumping machinery.

MONTEREY, TENN.—The Putnam Mining Company, Cookeville, Tenn., contemplates the installation of electric power equipment at its local properties.

BESSEMER, ALA. — Steps have been taken for the installation of an ornamental lighting system in the business district.

CHILDERSBURG, ALA.—The Childersburg Brick Company, recently formed, plans to build a power house at its proposed local plant, to cost about $100,000.

ELBA, ALA.—W. H. Cauley is planning to rebuild his power house and sawmill, recently destroyed by fire.

HATTIESBURG, MISS.—The Acme Oak Flooring Company contemplates the installation of a power house at its proposed local mill, to cost about $100,000. D. P. N. Hackney is head.

LITTLE ROCK, ARK.—The Arkansas Central Power Company has plans under way for the construction of an addition to its power plant, to cost about $75,000.

TILTON, ARK.—The T. J. Moss Tie Company, Security Building, St. Louis, contemplates the installation of a power house at its new lumber and sawmill at Wrape's Spur, near Tilton.

SHREVEPORT, LA. — Plans have been abandoned for the proposed municipal electric power plant.

McALESTER, OKLA.—The installation of electrically operated pumps in connection with extensions to the municipal waterworks is under consideration, and $375,000 in bonds have been voted.

COLORADO CITY, TEX.—The Tubbock Cotton Oil Company will install electric power equipment at its proposed new plant, to cost about $200,000.

DALLAS, TEX.—Plans have been approved for an ornamental lighting system on Knox and Travis Streets, for which bids will soon be asked.

SAN ANTONIO, TEX.—Tentative plans have been prepared by the San Antonio & Rio Grande Valley Traction Company for the construction of a hyro-electric plant on the San Miguel River, to cost about $300,000.

WILLS POINT, TEX.—Bonds to the amount of $25,000 have been voted for improvements to the electric light system. L. Gilmore is city secretary.

## Pacific and Mountain States

SEATTLE, WASH.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until June 12, for two transformers (Schedule 880), and for one switchboard (Schedule 881), for the Puget Sound Navy Yard.

SEATTLE, WASH.—The City Council has authorized an issue of $2,500,000 in bonds for extensions and improvements to the City Lighting Department as follows: Line extensions in residence districts, $385,000; installation of new services, $727,000; placing wires underground in the business district, $200,000; replacing four small generators with one 12,500-kw. generator at the Cedar Falls plant, $400,000; building warehouse, $250,000; substation at Spokane Street, $318,000; sealing operations at Cedar River basin, $100,000. The Council also authorized the sale of $1,000,000 of the Skagit bonds to complete the first unit of the hydro-electric project and also voted an appropriation of $40,000 to purchase the site for the substation on Spokane Street and Fourth Avenue.

OREGON CITY, ORE.—Contract has been awarded by the Hawley Pulp & Paper Company for the construction of an additional power plant, to have a capacity of

1,200 hp. The cost of the building is estimated at $100,000.

PORTLAND, ORE.—Grant Smith & Company, Portland, have filed two applications with the state engineer covering two power sites on the Deschutes River, one in Sherman County and the other in Wasco County. At the Sherman County site it is proposed to develop 40,000 hp., and about 29,000 hp. will be developed at the Wasco County site. The cost of the two projects is estimated at $8,000,000.

ANTIOCH, CAL.—The Pacific Gas & Electric Company has authorized an appropriation of $227,350 for the construction of the South Tower and Herdlyn transmission lines in Contra Costa County.

LIVERMORE, CAL.—The Pacific Gas & Electric Company has authorized the construction of two new transmission lines in Livermore Valley.

LOOMIS, CAL.—The Pacific Gas & Electric Company, San Francisco, contemplates the installation of an electric distributing in Loomis, to cost about $25,000.

LOS ANGELES, CAL.—Ordinances have been passed providing for the installation of ornamental lighting systems on Canal and Cahuenga Avenues, for which bids will soon be called.

OILDALE, CAL.—Steps have been taken by the Oildale Improvement Club toward the formation of a lighting district.

SAN DIEGO, CAL.—The Consolidated Gas & Electric Company plans to issue $1,438,000 in bonds and $674,400 in capital stock, part of the proceeds to be used for extensions and improvements.

SAN FRANCISCO, CAL.—The Pacific Gas & Electric Company is planning to erect a large substation, known as "J," in the heart of the financial district. It will eventually be equipped with eight 2,600-kw. rotary converters.

SAN JOSE, CAL.—Bids will soon be called for the construction of a power plant at the Santa Clara County Hospital, to cost about $90,000. Binder & Curtis, South First Street, are architects.

LOGAN, UTAH.—Bonds to the amount of $300,000 have been voted to rebuild the municipal electric light plant in Logan Canyon.

## Canada

NELSON, B. C.—Surveys are being made for the proposed transmission line extension of the municipal electric system from Nine-Mile on the Ainsworth to the Florence Silver Mining Company. The cost is estimated at $25,000.

SMITHERS, B. C.—The Federal Mining & Smelting Company, 120 Broadway, New York, contemplates the installation of electric power equipment at its local properties.

VANCOUVER, B. C.—Preparations are being made to make surveys of the Squamish, Cheakamus, Pitt, Lillooet, Chehalis, Chillwack and Bridge Rivers and the Harrison Lake district with a view of securing estimates of cost of establishing a municipal hydro-electric plant.

LARDER LAKE, ONT.—The Associated Canadian Goldfields Company, Ltd., according to *Commerce Reports*, contemplates the construction of a hydro-electric plant at Wendigo Falls. Plans for the initial installation provide for 2,500 hp.

SHEFFIELD, ONT.—The Hydro-Electric Power Commission is planning to erect a transmission line from Lynden to Sheffield.

TORONTO, ONT.—The Hydro-Electric Power Commission of Ontario has applied to the City Council for permission to erect a new steel-tower transmission line along the water front from Humber River to Strachan Avenue.

TORONTO, ONT.—The Provincial Government has appropriated $12,687,000 to cover work planned for the year by the Hydro-Electric Power Commission of Ontario as follows: Niagara System, for completing the Queenston plant and new transmission lines, $9,850,000; Muskoka system, additions to plants and new equipment, $360,000; Rideau system, maintenance and repairs, $20,000; Thunder Bay system, new units at Cameron Falls; Nipigon River, transmission lines, etc., $1,086,000; Central Ontario system, largely to cover new plant at Dam 8 on Trent River, $375,000; Nippissing system, storage works and auxiliary, $17,000; Essex system, transmission line, $50,000; investigation of second Queenston-Chippewa development, $50,000. F. A. Gabey is chief engineer.

MONTREAL, QUE.—The Southern Canada Power Company is planning the construction of an additional hydro-electric plant on the St. Francis River at Hemmings Falls, to develop 30,000 hp.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued May 15, 1923)

1,455,462. ELECTRIC RESISTANCE; O. Weeber, Berlin, Germany. App. filed April 10, 1918. For wireless tubes.

1,455,467. STREET INDICATOR; W. A. Wilson and S. Wilson, Vancouver, B. C. App. filed July 15, 1921. For trolley cars.

1,455,476. HOLDING OR SUPPORTING MEANS FOR RADIUM APPLYING MEANS; W. H. Cameron, Pittsburgh, Pa. App. filed Feb. 21, 1922.

1,455,572. ELECTRICAL SYSTEM; C. S. Cook, Pittsburgh, Pa. App. filed Oct. 30, 1916. Automatic railway substation.

1,455,578. TROLLEY COLLECTOR; P. T. J. Estler, London, England. App. filed May 2, 1922. Two trolley poles, one mounted above the other, for trackless cars.

1,455,592. PORTABLE LAMP; W. F. Lent, New Haven, Conn. App. filed March 24, 1921.

1,455,618. MOTOR-CONTROL SYSTEM; H. D. James, Edgewood Park, Pa. App. filed March 13, 1920. Dynamic braking.

1,455,638. FIRELESS COOKER AND HEATER; M. J. McFarlane, New Orleans, La. App. filed March 8, 1921. Has electric element.

1,455,668. MOTOR-CONTROL SYSTEM; G. B. Scheer, Berkeley, Cal. App. filed June 22, 1922. Insures dynamic braking upon failure of power supply.

1,455,717. ENGINE-STARTING SYSTEM; J. K. Delano, New York, N. Y. App. filed May 11, 1918. Motor-generator for automobiles.

1,455,735. RHEOSTAT; F. A. Rojas, New York, N. Y. App. filed March 23, 1922. Compressible resistance type.

1,455,747. ELECTRIC PROCESS OF CONTINUOUSLY HEATING METAL; A. E. Greene, Seattle, Wash. App. filed April 22, 1920. Superheating molten metal by passing through electrically heated furnace chamber.

1,455,748. ELECTRIC INDUCTION FURNACE; A. E. Greene, Seattle, Wash. App. filed Feb. 24, 1920.

1,455,767 and 1,455,768. WIRELESS RECEIVING SYSTEM; J. Slepian, Swissvale, Pa. App. filed Jan. 20, 1922. Responsive to signal from damped or undamped systems without heterodyning step.

(Issued May 22, 1923)

15,613 (reissue). SIGN FLASHER; J. H. Wheelock, Fitzwilliam, N. H. App. filed May 11, 1917. Contactors on motor shaft.

1,455,769. MACHINE SWITCHING TELEPHONE SYSTEM; R. C. Arter, Galion, Ohio. App. filed June 7, 1920. Relates to telephone systems, and particularly to the selecting and switching circuits.

1,456,781. ELECTRICAL CONDENSER; W. Dubilier, New York, N. Y. App. filed Dec. 7, 1921. One microfarad condenser composed of twenty units.

1,456,795. MEANS FOR CONTROLLING A PRODUCTION PROCESS; L. Logan, Pittsburgh, Pa. App. filed Dec. 20, 1920. Control scheme involving light cell to actuate a relay.

1,456,811. METHOD OF UNITING METAL PLATES; J. C. Sander, Lynn, Mass. App. filed May 10, 1920. Welding a thick and thin plate.

1,455,817 and 1,455,818. TELEPHONE OR OTHER SOUND RECEIVER; L. Steinberger, Brooklyn, N. Y. App. filed Jan. 21, 1921. Equalization of air pressure on both sides of diaphragm.

1,455,827. SELECTIVE CIRCUIT FOR MULTIPLEX TRANSMISSION; H. A. Affel, Brooklyn, N. Y. App. filed Sept. 24, 1919. Several signals transmitted over grounded conductor such as submarine cable.

1,455,842. IMPLEMENT FOR WRITING; W. F. Kelly, Greenwood, Miss. App. filed March 23, 1922. Heated marking element.

1,455,843. SYSTEM FOR MEASURING DISTORTION; M. Kirkwood, East Orange, N. J. App. filed Feb. 7, 1920. For telephone systems.

1,455,845. MODULATED SIGNALING SYSTEM PARTICULARLY APPLICABLE TO WIRELESS SIGNALING; N. Lea, London, England. App. filed May 2, 1921. Amplifying apparatus.

1,455,895. ELECTROMECHANICAL BRAKE; E. B. Thurston, Toledo, Ohio. App. filed Nov. 12, 1923. For elevators.

1,455,896. WIRELESS TELEGRAPH RECEIVER; L. B. Turner, Cambridge, England. App. filed Feb. 9, 1921. Method of increasing speed of receiving telegraph signals.

1,455,903. RHEOSTAT; W. G. Clark, Oak Park, Ill. App filed May 9, 1921. For railway motors.

1,455,909. ELECTRIC COOKER AND HEATER; G. O. Ditton, Lanoka, N. J. App. filed Aug. 16, 1921.

1,455,938. SIGNAL LANTERN; F. J. Rode R. I. Frost and J. L. Liston, Augusta, Kan. App. filed April 21, 1921. Any one of several different colored lights may be projected.

1,455,951. SEMI-AUTOMATIC TELEPHONE SYSTEM; B. D. Willis, Chicago, Ill. App. filed May 31, 1919. Two-way trunk circuit between manual and automatic exchanges.

1,455,954. TELEPHONE SYSTEM; G. A. Yanochowski, Chicago, Ill. App. filed April 25, 1917. Link circuits having automatically ringing secret service.

1,455,957. REPEATER SYSTEM; E. D. Johnson, East Orange, N. J. App. filed Jan. 18, 1918. One-way repeater reversibly connected for two-way transmission of signals.

1,455,958. SIGNALING SYSTEM; E. D. Johnson, East Orange, N. J. App. filed Jan. 24, 1918. Automatic repeater for telephone lines.

1,455,998. CALLING DEVICE ATTACHMENT; F. W. Fahrenfeld, Chicago, Ill. App. filed May 1, 1920. Dial for automatic telephone system.

1,456,033. ELECTRIC STARTING AND GENERATING APPARATUS; W. B. Moses, Portland, Me. App. filed March 30, 1917. For automobiles.

1,456,059. SIGNALING SYSTEM; E. D. Johnson, East Orange, N. J. App. filed Jan. 18, 1918. Automatic repeater for telephone lines.

1,456,076. MEASURING AND TESTING OF INDUCTANCES; C. W. Robbins, La Grange, Ill. App. filed June 18, 1921. Apparatus for measuring telephone loading coils.

1,456,081. ELECTRIC REGULATOR; W. A. Turbayne, Niagara Falls, N. Y. App. filed July 17, 1919. Dead-beat and sensitive to small changes.

1,456,082. MOTOR DRIVE; H. E. Warren, Ashland, Mass. App. filed Sept. 1, 1920. For synchronous motor-driven secondary clocks.

1,456,084. SUPPORT FOR OVERHEAD WIRES OF ELECTRIC RAILWAYS; H. Westphal, Berlin, Germany. App. filed Oct. 7, 1922. Clamping car.

1,456,091. ELECTRICAL APPARATUS FOR ILLUMINATING AND DECORATING CHRISTMAS TREES AND SIMILAR USES; J. H. Betts, Brightwater, N. Y. App. filed Feb. 12, 1919.

1,456,092. DYNAMO-ELECTRIC MACHINE; J. L. Burnham, Schenectady, N. Y. App. filed Oct. 30, 1920. Provided with anti-sparking windings.

1,456,100. TIME-ELEMENT CIRCUIT CONTROLLER; J. Eaton, Schenectady, N. Y. App. filed Jan. 15, 1920. If voltage fails device holds motor switch in until motor speed drops to predetermined value.

1,456,104. DEMAND METER; C. I. Hall, Fort Wayne, Ind. App. filed Oct. 6, 1919. Mechanical means for resetting pointer.

1,456,107. ELECTRIC RESISTANCE FURNACE; C. L. Ipsen, Schnectady, N. Y. App. filed May 28, 1921. Support for ribbon elements.

1,456,108. COIL AND SPOOL CONSTRUCTION; S. E. Johannssen, Pittsfield, Mass. App. filed Feb. 6, 1920. Method of forming coil on spool.

1,456,110. SEAL FOR ELECTRIC DEVICES; G. M. J. Mackay, Schenectady, N. Y. App. filed Jan. 21, 1921. Lead-in terminal for airtight apparatus.

1,456,120. MAGNET FRAME; J. Burke, Erie, Pa. App. filed Nov. 6, 1919. Frame to hold field coils for electrical machinery.

1,456,141. ELECTRIC HEATER; C. H. W. Morrison, London, England. App. filed July 10, 1922. For heating small quantities of liquid or semi-liquid substances.

1,456,148 and 1,456,149. RECORDING APPARATUS FOR VALVES AND THE LIKE; C. E. Renshaw, East Orange, N. J. App. filed July 29, 1919. Apparatus to show whether valve is opened or closed.

1,456,172. TELEPHONE SYSTEM; G. A. Yanochowski, Chicago, Ill. App. filed Jan. 16, 1919. Apparatus and circuits for connecting links.

1,456,194. COMBINATION FLOOR LAMP, TABLE LAMP AND PEDESTAL; J. Rosenberg, Chicago, Ill. App. filed Jan. 9, 1922.

1,456,223. ELECTRICAL BLANKET AND THE LIKE; W. F. Craddock and C. M. Uhlig, Chicago, Ill. App. filed April 7, 1922. Element woven into blanket.

1,456,267; VARIOMETER; H. P. Donle, Meriden, Conn. App. filed Feb. 17, 1922. Two coils on same axis rotatable in regard to each other.

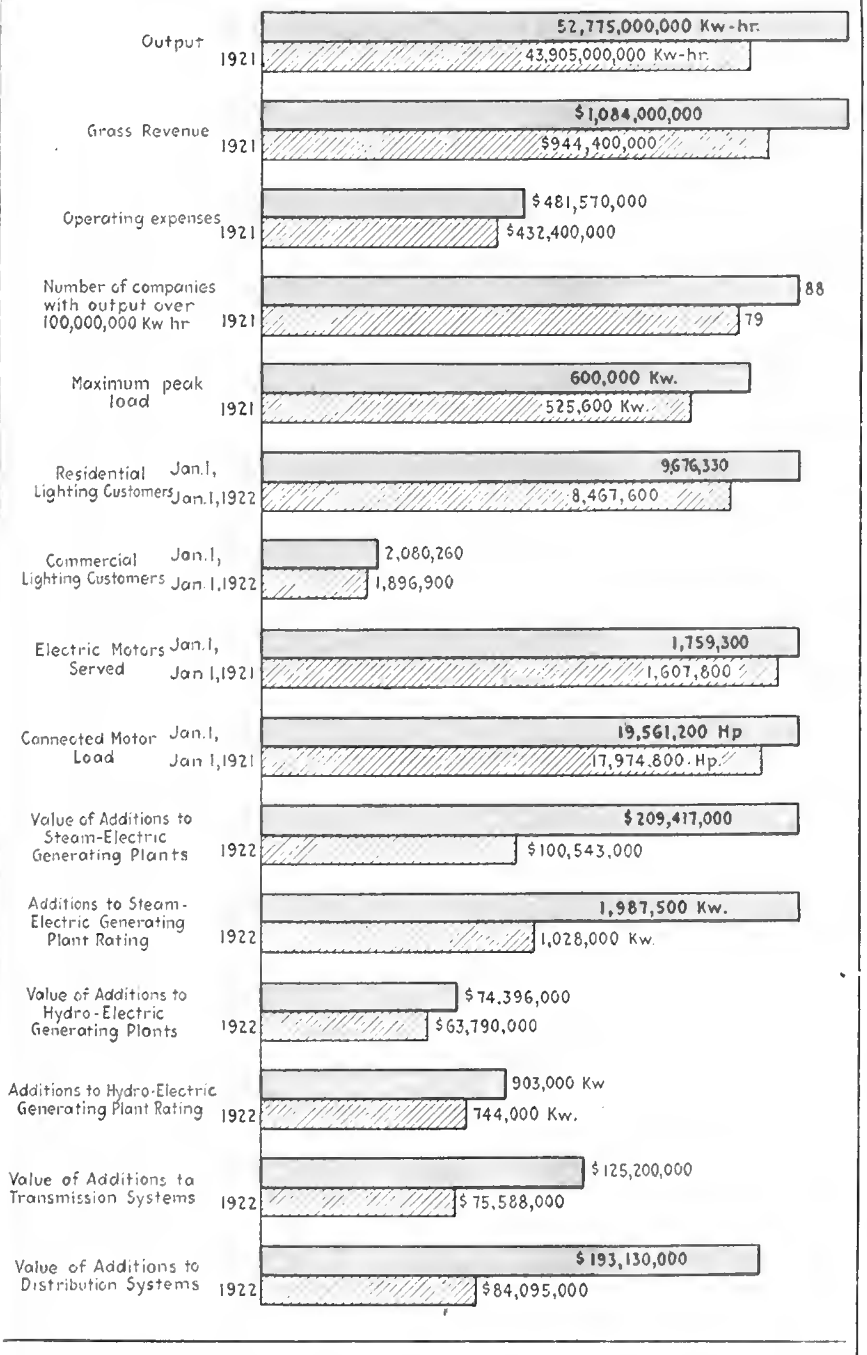
1,456,282. ALTERNATING-CURRENT ELECTRIC BELL; C. J. Rohland, Seekonk, Mass. App. filed April 12, 1916.

1,456,285. THERMOSTATIC LAMP-DIMMING PULL SOCKET; R. D. Smith, Milton, Mass. App. filed Nov. 3, 1920.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

## High Lights in the Central Station Industry



Most of the data for statistics in the ELECTRICAL WORLD are gathered by it from original sources. Privilege is freely given to readers of the ELECTRICAL WORLD to quote or use these statistics for any legitimate purpose. While there is no requirement that the source of data be given, yet it would help the ELECTRICAL WORLD in obtaining and compiling further basic information if those using these statistics would credit the ELECTRICAL WORLD.

## The Vision of the Future

*"We will not anticipate the past. Our retrospection will be all to the future."*

THE electric light and power industry is essentially an industry with all the future anticipations of youth—of a young athlete fresh from a long period of intensive training and brilliant accomplishments, fully ready and anxious to conquer the problems of the future with every expectation of a successful issue.

The group of America's servants which met in convention during the past week represented every phase of the industry and every section of the country. They are proud of their past—of the way they have kept faith with the public, of their accomplishments in overcoming inefficient generation, transmission and distribution of electrical energy, of the enviable place which the industry has assumed in the financial world, and of the general growth in operations during the first forty years of the industry's life. They feel themselves standing upon a foundation which is as solid as the very nation itself.

But while these men and the great industry they represent feel a legitimate pride in that which has been accomplished, it is on the future that all eyes are focused. What of it? What are the problems which will have to be met and solved if the industry is to continue triumphant on its way? Will the present rate of growth continue, and, if so, how long?

The answers to these questions are shrouded in the uncertainty of human events and the adaptation of electrical energy to new fields of usefulness. But much may be judged by a retrospective glance at the industry's growth. The theory of probabilities can be brought into play and the future to a certain degree can be foretold. Such prophecies, if not extended too far into the future, are permissible. Indeed, they are necessary if effort is to be crowned with success.

The industry should without doubt live in the future, but the past should ever serve as a guide to the unseen problems which are sure to be encountered as history unrolls.

## Volume of Construction on the Decrease

High cost of materials and increased wage demands of labor are very definitely reflected in the slump in the volume of new construction reported during March and April. Reports are that this slump will be even more emphasized during May. Decreased cost of materials during April was the natural result of a decreased volume of construction. In other words, the holding back of new construction seems to be obtaining the desired results—decreased construction cost.

# Public Relations—Close Up

THE topic upon everybody's tongue at the great convention in New York was public relations. Public utility men, central-station executives were all talking about it. The problem of serving the public heartily and of intelligently interpreting this service to the public received the most conspicuous attention.

Public relations has come to be a very big thing in the light and power business. But really public relations is not one big thing at all. It is a very great many little things.

OUT in Omaha, as an example, the Nebraska Power Company believes that the secret of public relations is to take care of customers when they are in trouble. And so it maintains a staff of motorcycle men to answer trouble calls, just as many other companies do. But as Vice-president J. E. Davidson puts it: "It isn't so much what you do as the way the thing is done that registers with the public." Therefore the Omaha company has made it the objective in these trouble calls not only to go and straighten out the troubles but to surprise and please the customer with the spirit of the service.

A telephone call comes to the Nebraska Power Company's switchboard. Mrs. Ray is giving a party and the lights have gone out. "I'm awfully sorry!" says the girl; "I'll send a man at once"—a sympathetic and personal response.

The two best troublemen are on duty at night, so placed and trained that any residence in town can be reached within ten minutes. In five minutes perhaps a motorcycle thunders up, the doorbell rings, and the Nebraska Power man is there, expresses sympathy, renews the fuse, asks if there is anything else that he can do and leaves.

He makes the same fast time back to his post and reports to the switchboard girl. In, say, about eight minutes after Mrs. Ray has thanked him and closed the door her telephone rings. It's the Nebraska Power girl, still much concerned. "Has our man arrived? He has? I'm so glad! Is everything all right? Can we do anything more?" In short, within, say, twenty minutes the man has come and gone and all is well and a sweet voice from the company has followed up, full of concern. And every call makes one more friend.

SUCCESS in building up good public relations is the good relationship between the individual representatives of the company and the individual customers. But we the public utility employees are naturally absorbed in our own work and apt to be forgetful of these little incidental courtesies. And we the people are no less absorbed in our own affairs and apt to accept these services as a matter of course and also to be supercritical. The maintenance of harmony in all these contacts is therefore not only an important but a very difficult responsibility.

Public relations everywhere and every day depend on putting extraordinary heartiness and helpfulness into the ordinary human intercourse between all the men and women of the company and all the men and women of the city. It is not done, it never will be done, unless the chief executive of the utility makes it his own concern and leads and guides in both the planning and the performance of it.

# Ray Palmer

*A man who as consulting electrical engineer, head of metropolitan department and president of a great central-station system has achieved a triple success.*

RAY PALMER, president of the New York & Queens Electric Light & Power Company, which serves 108 square miles of territory in New York City, was formerly Commissioner of Gas and Electricity of Chicago and in that capacity evolved and completed what has been termed the most nearly perfect system of municipal lighting in the world. In addition he reorganized the Department of Gas and Electricity into separately working divisions of electric wiring and repairs, operation and maintenance, engineering and construction, lighting, fire alarm and electrical inspection, which resulted in a large saving to the city. Mr. Palmer fought incessantly for the passage of an ordinance to combat electrolysis which was opposed by the street and elevated railways but was finally passed. It conferred many benefits and saved the city and the public utilities, as well as the owners of steel structures, a large sum of money each year. He also fought for reasonable regulation of public utility rates. After resigning from the position of Commissioner of Gas and Electricity, Mr. Palmer practiced as an electrical engineer in Chicago for a short time until on Nov. 1, 1915, he was chosen vice-president and general manager of the New York & Queens company. He was advanced to the presidency Sept. 19, 1916.

Mr. Palmer was born in Sparta, Wis., March 29, 1878, and was graduated from the University of Wisconsin in 1901 as an electrical engineer. He was for a time assistant superintendent for J. G. White & Company on substation installation work in New York City, and after the completion of this work he continued on the firm's engineering staff in London, England. He was later appointed electrical engineer of the Union Traction Company of Chicago, but left that organization to open an office as a consulting engineer in Chicago and Milwaukee and continued in private practice until his appointment by Mayor Carter Harrison to head the Chicago Department of Gas and Electricity. This appointment was entirely unsolicited and came as a surprise to Mr. Palmer, who had had no thought of holding public office and was able to work for the good of the city as he saw it without being trammeled by political obligations.

Mr. Palmer is a fellow of the American Institute of Electrical Engineers and a member of the Illuminating Engineering Society, the National Electric Light Association, the New York Electrical Society, the Engineers' Club of New York, the Engineers' Country Club, the Flushing Country Club and the Bayside Yacht Club.

Electrical World, June 16, 1923

Volume 81 Number 24

### A National Survey of Electric Service

AN EXCELLENT suggestion for satisfying the millions of users in this country that the electric light and power companies mean to give the best possible service was made by M. H. Aylesworth at the convention of the National Electric Light Association last week. Carried out in the right spirit, a country-wide survey ought to work wonders for the industry nationally just as it has locally whenever and wherever it has been tried. To get acquainted with each customer, ascertain his wants, and to show by word and deed an interest in him cannot but result in fostering a spirit of good will. Of course, all depends on how the thing is done. The idea will "go over big" if the utilities go about it frankly and honestly for the good of the service. The value of good public relations is generally conceded, and Mr. Aylesworth's suggestion not only comes at an opportune time but has advantages that loom greater and greater the more one considers it. We are glad that the plan is to be carried out under the direction of the Public Relations National Section of the N. E. L. A. and with the active co-operation of the Commercial Section. It is worth all the effort that can be put in it.

### One Million Words! How Many Will Be Effective?

A FAIR estimate of words spoken in the regular convention program last week would surely approach the million mark. Think of the stenographic service—to say nothing of the mental effort of the speakers! Is it all to good purpose? That depends on how many words were caught—how many ideas will be applied. It behooves every one to utilize them to the utmost!

### The Medal of the Southern California Edison Company

IT IS particularly gratifying that the first medal awarded by the Coffin Foundation should be given to the Southern California Edison Company of Los Angeles. We doubt whether in the short time at its disposal the committee could have reached such a decision were the company not generally recognized as one of the most progressive and enterprising in the world. This applies to its executive, engineering, operating and business departments. The company's program for water-power development is far-sighted and mapped out ten years in advance. Its transmission lines operate at the highest voltages in use. In the matter of public relations the Southern California Edison Company has been a leader in the industry, and as for popularizing the use of electricity few companies can approach its record for household saturation. Its customers as well as its employees have bought freely of its securities and in the last election fought valiantly in its defense. This, after all, is the best evidence of a company's standing and worth in the community.

The Southern California Edison Company has shown commendable faith in the people of California and has well deserved the honor bestowed on it. The whole industry takes pride in its accomplishments.

### On a Partnership Basis

A PREDICTION that within three years' time a million of their customers will own securities of the light and power companies was made in the report of the customer-ownership committee of the National Electric Light Association. With more than 425,000 customer-owners added as investors in these securities, and with the astounding growth and popularity of the movement, such a prediction would seem to be conservative. What a remarkable vista opens to the utilities under these conditions! Financing from local territories in quantities as needed and at low rates is only the least of the things gained. Public relations are sure to be improved by the association of customers with the utilities, and the utilities to be inspired to new heights of efficiency by the knowledge that, through security ownership, their customers are part and parcel of the organization and will, as partners, keenly scrutinize its work.

This whole movement is one of those miracles that occur in the electrical industry at needed intervals to revive and reinspire it and further its progress toward the goal of an electrified America with all the incidental high standards of living that this implies. The leadership that grasps these constructive ideas and carries them through to success cannot fail to safeguard the movement and guide it along proper channels. Vision is lacking to predict the ultimate consequences of the great partnership now under way, but its conception is sound, its principles are correct and its ideal is good. The industry will reap as it sows.

### "Electrifying" a River

WHEN the Davis Bridge hydro-electric plant of the New England Power Company shall be placed in operation some months hence another important step will have been taken in conserving the waters of the Deerfield River for the benefit of power users within transmission distance of this noted little stream. Readers of the article by Messrs. Eaton and Collins which describes this development will do well to study the profile diagram of the Deerfield and to note how logically the hand of the engineer is carrying forward what might be called the "electrification" of the river. Running south from the hills of Vermont and east from

the Berkshires of Massachusetts, this representative "flash" stream is being made to yield energy at every strategic point, so that when the program is completed no less than 110,000 kw. will be produced in a watershed of 550 square miles. Stabilization of flow through large reservoir construction at two places, combined with skillful development of heads on the way down the valley, tells the story.

The Davis Bridge station will be the largest on the system, surpassing even the Vernon plant on the Connecticut River. Instead of being regularly tied in with the adjacent 66,000-volt transmission lines of the company, it will be directly connected with the load center of the system near Worcester, Mass., by a 110,000-volt trunk line nearly 80 miles long. Flexibility and efficiency of operation, however, will be increased by autotransformer interconnection at Davis Bridge with the 66,000-volt ring transmission lines into which the other hydro-electric stations regularly feed. The hydraulic and electrical features of the development contain many points of interest, but in considering these details the relation of the development to the system as a whole and to the river itself should not be overlooked. The Deerfield program as a whole, when completed, will save New England about half a million tons of coal a year—an example of conservation reflecting great credit upon the financial and engineering interests which are working out this praiseworthy achievement.

## Know the "Curbstoner" Better and Lift Him Up

IT IS said that 60 per cent of the wiring that is done in America is installed by small contractors who are not really organized into the electrical industry through membership in any association. They are "curbstoners" and other small contractors who have not felt the responsibility and the opportunity of the industry in the mass sense. They have not felt the impulse to affiliate with other contractors to promote co-ordination and co-operation in their calling. Here is a matter that deserves the very serious consideration of every one who is working to strengthen and build up at some point progressive organization among electrical men.

These small contractors are vitally important. They form the skirmish line for both the manufacturer and the jobber whose products must ultimately be sold to and installed in the homes and business places of the people. They provide a most intimate contact between the electrical industry and the public, but they are for the most part concerning themselves but little with any of the broader purposes of the industry. They are not thinking with the rest of us. They are not working with the rest of us. And so this great, active force of workers is not tied in and is not being applied.

There is much to be done in the interpreting of electric service to the people. Much is already being done to inform and educate and guide public opinion toward a clearer conception of the part that electricity is playing in our modern community and household life. It is a pity that all the influence of this small army of electrical workers whom the people know so well is not directed to the support of the central station and the promotion of the ideals of the industry.

But it is not a matter to be dismissed with a lament. Real progress can be made if the electrical family of each community will assume responsibility for meeting the condition in its own town by an active effort to know this small local wiring contractor better and to influence him to become a working member of the local family and to join his national association. The central-station commercial executive can well afford to take the initiative in such a work.

## A Promising Co-operative Method That Is Often Neglected

CONSTRUCTIVE suggestion is better than destructive criticism, affirmation than negation, and sometimes it is speech, not silence, that is golden. Sight of these truths, however trite they may be, is lost by operating engineers and users of equipment who condemn manufacturers for not keeping designs of specified apparatus up to service requirements but do not take the trouble to point out to the makers the things that need remedy. Merely to discontinue the use of inadequate apparatus, saying nothing, is not the best way to bring about its improvement. Such a course denotes dissatisfaction no doubt, but affords the designer no clew as to its cause. To denounce a type of equipment in general terms is scarcely more helpful and does not prove that the fault is with the tool and not with its user.

Is not the right method—the only one that brings results—to make known to the manufacturer what the defects of his products, as manifested by operating experience, are? Of course, users of equipment cannot be expected to carry on research work for the manufacturers or to design equipment. That is not the idea, but simply that the results of their operating experiments and investigations be not locked in their own bosoms, as if these efforts were among the blunders worse than crimes, but told to the maker of the equipment concerned. Indeed, why should they not be freely and widely published? No individual manufacturer could then possibly profit by them at the expense of his own competitors, and the improved construction that would in many cases follow this public-spirited course would redound to the benefit of the entire industry.

## Order Evolving in Reactive Metering

ORDER is gradually evolving from the efforts of the industry to provide a practical metering basis for either kilovolt-ampere-demand charges or power-factor rate adjustments. Whether clarification of the situation can be considered complete before a single standard practice has been adopted is an open question. Viewed from the angle of the lay consumer, however, a multiplicity of methods can hardly be conducive to easy progress of the tendency to differentiate in the bill between fixed and variable charges. Again, from the consumer's standpoint there should be as thorough simplicity of metering methods as of rate schedules. Simplicity obtained at the expense of certainty would, however, be false progress. It is unfortunately true that there are managers who will provide their billing clerks with adding machines and other appliances to insure 100 per cent accounting accuracy, but will, on the other hand, be content with mediocre meter accuracy.

Expediency has thus prompted the adoption of several of the reactive metering schemes now in vogue. Some of the common schemes involve inherent errors under conditions of unbalanced loads or voltages, and

these are not generally appreciated. The results of an investigation of metering methods by one of the large utilities show that the errors range from less than 2½ per cent for favorable load conditions to as high as 50 per cent under extreme unbalance, a true power factor of 50 per cent being indicated as 75.6 per cent by one of the reactive metering methods.

There remains, therefore, great room for improvement before reactive metering schemes can be used without a great deal of engineering skill, and a simple metering system which eliminates the errors is needed badly. Some very encouraging features of a new system appeared in the article by R. D. Evans in the Feb. 10 issue.

## Reliable High-Voltage Cables Still in the Future

RARELY does an engineering problem resist the efforts of the specialists when an imperative demand exists for its solution, but in the case of the high-voltage cable for underground service long-continued effort has not yet produced a satisfactory answer. Operating companies could use this type of cable to advantage in overcoming existing distribution handicaps. Streets are becoming more congested with underground installations; power demands are increasing in magnitude; power plants are becoming larger and the cost of the low-voltage cable installations greater. Even now manhole fans, forced-air ventilation and water cooling are expedients forced on central-station companies in their effort to supply the power demanded by using available methods and equipment.

Of course, progress has been made and is still being made in the manufacture of cables. Several installations are now under way which use three-conductor cables rated from 30,000 volts to 35,000 volts, and in one instance operation is contemplated at 88,000 volts to ground. In one locality several miles of single-conductor, 66,000-volt cable is being installed. Such voltages are much higher than were considered practicable three years ago, and the improvement has been brought about by very skillful research work. Not only have dielectric losses been reduced and the dielectric strength increased, but manufacturing technique has been improved and a better knowledge exists of the phenomena of dielectric breakdown. On an operating basis for average temperatures and dielectric strengths, cables of still higher voltage are possible, but service reliability is jeopardized by the fact that local hot spots and mechanical imperfections may occur very frequently.

The report of the underground-systems committee of the N. E. L. A. shows that there has been a great deal of improvement in the mechanical perfection of cables and in methods of cable testing, but data compiled from representative installations shows that going to high voltages is accompanied by increased risks. On cables operating from 6,000 volts to 15,000 volts there were 10.8 failures per year per 100 miles of cable as compared with 15.7 failures on those operating between 10,000 volts and 33,000 volts. These data were taken over a five-year period and do not support any positive conclusions to the effect that the reliability of cables has been bettered since 1918.

Another interesting bit of data shows 3 and 7.8 as the average number of joint failures and cable failures respectively in the 6,000-volt to 15,000-volt class per 100 miles of cable and 7.1 and 8.6 for the same type of failures in the 20,000-volt to 33,000-volt class. Thus joint failures occur more frequently in the high-voltage type, and in both classes the cables fail more frequently than the joints.

An exact knowledge of the basis of breakdown for solid or semi-solid insulation made up of several constituents is as yet unknown to the specialists. Apparently it is physically impossible to eliminate the presence of air spaces between the conductors and the sheath, and the desired cable cannot be produced until the requisite fundamental knowledge and mechanical technique are available. We are told that European cable manufacturers make a product superior to that found in this country, but investigation shows little to support this conclusion. Comparisons show that American cables are more than equal in quality to the European, and American engineers have concluded that the solution of the problem rests with American and not with European manufacturers.

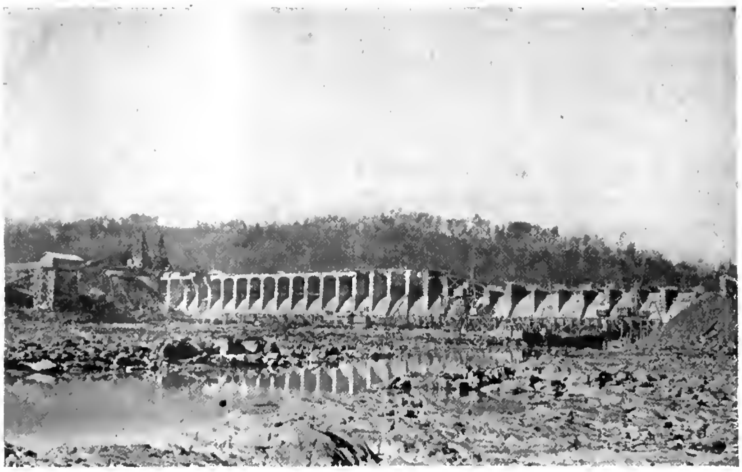
## Further Insulator Research Is Needed

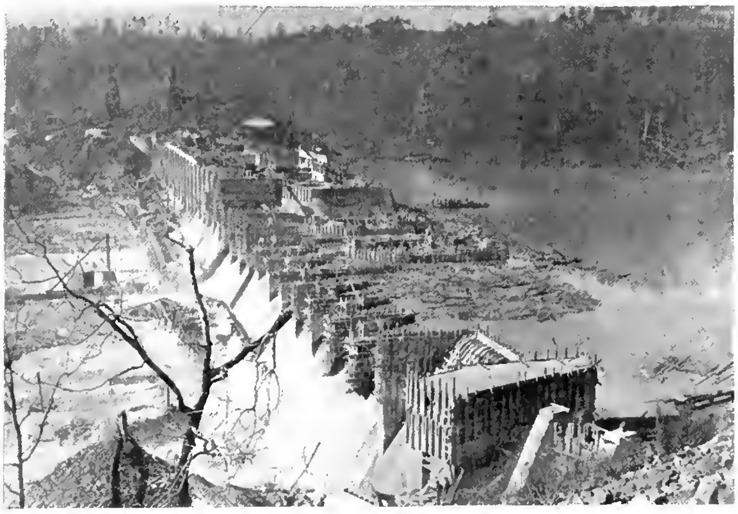
GRATIFYING progress in the testing of insulators on live lines is indicated in the article by F. C. Doble, published in this issue. Interest in this general subject has been mounting within the industry for several years, and as the importance of particular lines has increased the desirability—indeed, the necessity—of being able to test without shutting down has become compelling. Thus far this method has shown remarkable flexibility in its range of usefulness when applied to both pin-type and disk insulators and has effectively "weeded out" insulators secretly "planted" on tested lines, besides detecting others which have deteriorated in service toward the point of hazard to continuous line operation. The attention of safety experts may well be directed to the method described, which seems remarkably free from the limitations that have given trouble in the past.

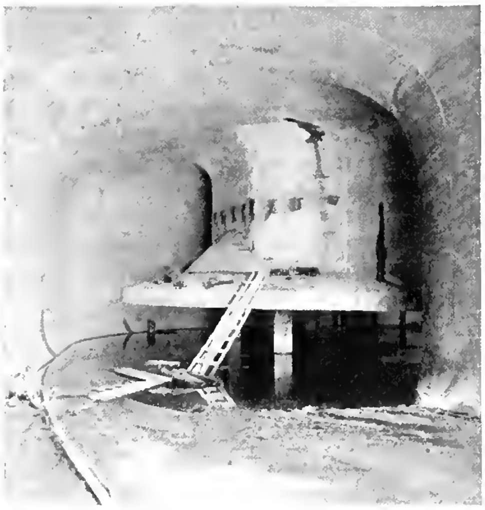
Mr. Doble's investigations have been pursued over several years, the later of which have been actively employed in field tests on commercial transmission lines illustrating typical Eastern and Middle Western conditions. They already indicate that the values of voltage distribution over insulators differ from the assumptions that have formerly been regarded as reasonably accurate. As this method is further utilized interesting data along this line may be expected.

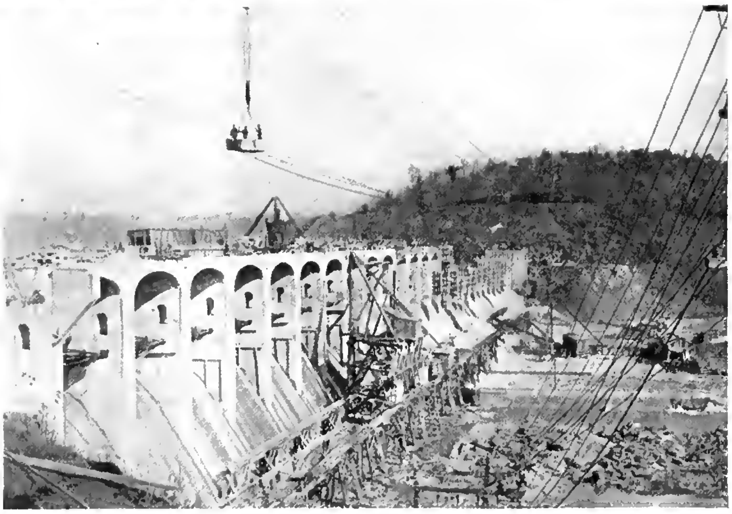
It is very much to be desired that some co-operative research be launched in the near future to determine the insulator conditions of deterioration which warrant removal of defective units from active lines. Tests show that many of these insulators are giving good service notwithstanding their deterioration from initial quality, and thus far operating men are obliged to use their own judgment, supplemented by that of testing engineers, in regard to the withdrawal of units from service. It is possible to magnify these telephonic indications very effectively by the use of the vacuum tube and loud speaker, and there may be potentialities of semi-quantitative measurement of leakage sounds along this line. The importance of continuous and reliable service on transmission lines is so great that the central-station industry will do well to consider the early establishment of a research the progress of which can be published and discussed as it goes forward for the benefit of distributors and users of energy.

# Unique Mitchell Dam Plant Now in Operation Twelve Weeks









ELECTRICITY has now been generated about three months at Mitchell Dam, the unique hydro-electric station of the Alabama Power Company on the Coosa River. The water was first turned through the wheels on March 26. The plant, which will have an ultimate rating of 120,000 hp. in five units, is unusual in several features, as explained in detail in the June 10, 1922, issue of the ELECTRICAL WORLD. Its waterwheels and generators are separately mounted in concrete islands along the up-stream face of the dam, and water flowing over the spillway, which occupies the entire length of the dam, is utilized to force the discharge of the draft tubes down stream. Thus during high water the back-water elevation is greatly suppressed. Besides, this plant has the distinction of having no generator room, each unit being housed under a small roof, which can be opened for handling equipment with an outside crane. All transformers and switching equipment are mounted outdoors on the deck of the dam. The cost of the plant is said to be no more than for a conventional plant of the same rating. Furthermore, the capacity during high water and the energy output possible per year are in excess of the amounts obtainable in conventional designs.

# Progress in Field Testing of Insulators

## Importance of Periodical Investigations—Problem of Detecting Conditions Which May Lead to Failure—Results from Practice—Flexibility of Method Pursued

By FRANK C. DOBLE
*Doble Engineering Company*

THE inherent properties of porcelain insulators of even the best designs now manufactured make the completed unit subject to deterioration. This deterioration may be due to cracks from the unequal expansion of the materials in the insulator unit, to rough handling or shooting, to lightning or power arcs. It may also be caused by leaks due to porosity, although modern manufacturing methods have nearly eliminated this defect. Two field testing problems confront the operating engineer—(1) how to find insulators in stock which warrant rejection before putting them into service, and (2) how to locate insulators in service which have depreciated before they have become too serious a hazard.

Certain general requirements for the solution of the first problem at once call for a more effective method than merely visual inspection in order to show such defects as internal breakage, porosity and so forth. A method employing a voltage stress across the insulator will make possible other indications of deterioration.

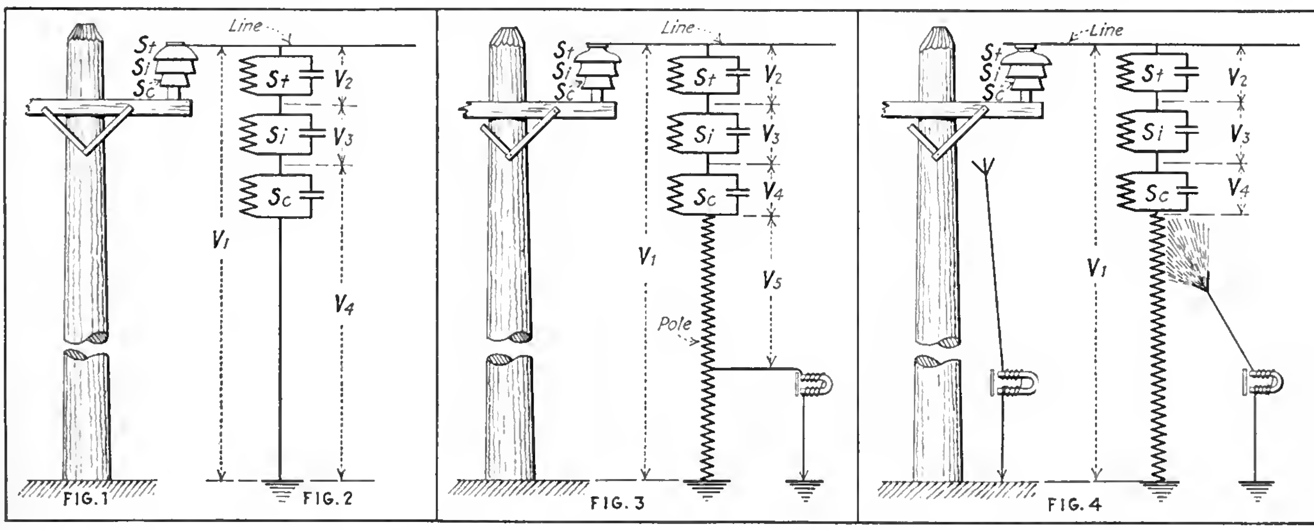
Any method for the solution of either problem must necessarily be simple to operate, definite as to indication and should be applicable to live lines. It should also be capable of indicating defective insulators at predetermined points of deterioration, in order that they may be detected and discarded before installation on the line or detected and removed from service before causing too serious a hazard.

A proper insulator-testing device must first be safe to use under all conditions of insulator deterioration, and it must be capable of indicating defective insulators at predetermined points of deterioration and on widely different types of construction.

From the standpoint of safety the testing device when applied to an insulator must not short-circuit the whole or any part of the insulator, it must not reduce the resistance of the leakage path over any part of the insulator nor raise the voltage on the whole or any part of the insulator, because if any of these things take place on a very bad insulator under test it will fail and cause a short circuit or ground.

As an insulator deteriorates there will be a variation in the leakage or charging current, or in the proportion of the voltage stress division over the insulator, and a device which will give some sensible indication of abnormal variations in this current or voltage stress distribution will show some measure of its deterioration.

Fig. 1 represents a conventional three-shell, pin-type, insulator and Fig. 2 is a diagrammatic representation



FIGS. 1 AND 2—POTENTIAL DISTRIBUTION OVER PIN-TYPE INSULATOR IN GOOD CONDITION. FIGS. 3 AND 4—POTENTIAL DISTRIBUTION WITH NON-INSULATED TYPES OF TELEPHONIC TESTING EQUIPMENT. VALUE OF INSULATION UNCHANGED

of the same insulator with each shell represented as a resistance and a capacity in parallel and the three shells in series between line and ground. The three shells of the insulator are named top, intermediate and center, and in the diagram are designated by *St*, *Si* and *Sc* respectively. The total potential $V_1$ over the insulator is shown as subdivided into the values $V_2$, $V_3$ and $V_4$ over the various shells as a normal condition.

The apparatus which has so far been developed for testing insulators in service on live lines may be generally classified under three types:

1. Non-insulated telephonic type.—Two forms, both of which are adaptable only to non-grounded construction.

2. Short-circuit type.—Two forms, known as metallic short-circuit method for pin-type and suspension-type insulators and spark-gap short-circuit method for pin-type insulators.

3. Insulated telephonic safety type.—Two forms,

known as Doble safety method, type A, for pin insulators, and Doble safety method, type B, for suspension insulators.

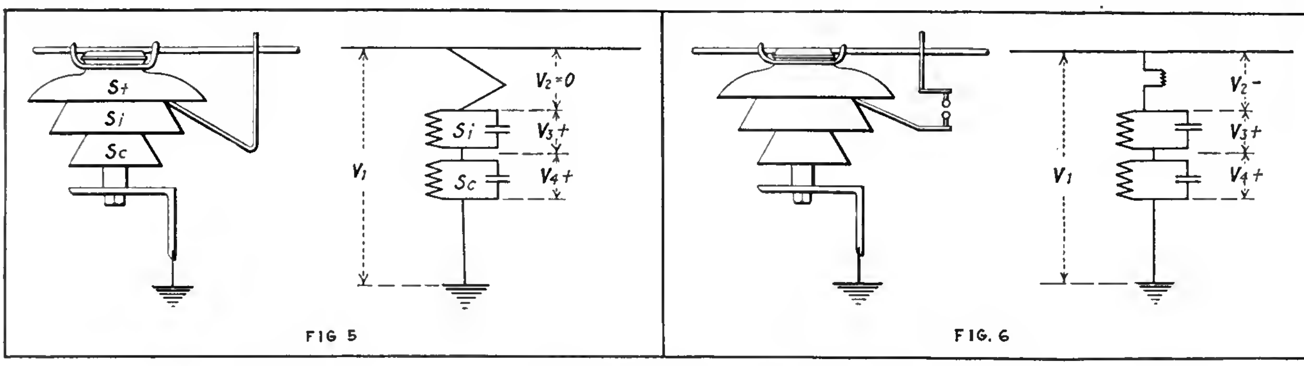
The operation of the non-insulated telephonic type of apparatus depends upon the leakage current, and its use is limited to the special condition of a non-grounded support such as a wooden pole, which acts as a very high resistance in series with the insulator, as in Fig. 3. A pair of high-resistance telephone receivers are connected in parallel with a considerable section of the pole, and a part of the leakage current flowing down the pole is shunted through the receivers; or the upper connections may be an arrangement of sharp points to collect energy from lines of stress emanating from the pole or insulator as in Fig. 4. In either case the indication is a comparative one, since a good insulator gives some noise. Great care must be used not to bring either terminal of the circuit too near any live line, since there is a direct metallic connection to the operator. The operating conditions of the line are not changed by these tests, and the test results are limited.

The operation of the short-circuit type of tester depends upon the voltage stresses as distributed over the various shells. The apparatus is applied directly to an insulator. By the metallic short-circuit method the top shell may be short-circuited as shown in Fig. 5, and then the short-circuit broken and an arc drawn from one of the contacts, provided sufficient potential exists across the shell under test. The length or strength of this arc is noted and compared, in the judgment of the operator, with the similar arc given by a known good insulator.

By the spark-gap short-circuit method the top shell may be short-circuited as shown in Fig. 6 with an air gap in series to act as a measure of the voltage. The maximum gap which will be jumped by the voltage across the top shell of a good insulator is found, and the deterioration of other insulators is judged from the lesser gap which the stress across their top shell will jump.

It will be noted from Figs. 5 and 6 that a short-circuit type of tester changes the operating condition of the line by actually removing a part of the insulator under test from service, by virtue of the short circuit. When a short-circuit method is applied to suspension insulators the same condition takes place, in that a portion of the insulator under test is short-circuited and the operating conditions are actually changed.

The operation of the Doble safety method depends upon the voltage stresses as distributed over the various shells of a pin-type insulator with the "type A" tester, or over the units of a suspension string with the "type B" tester.



FIGS. 5 AND 6—POTENTIAL DISTRIBUTION WITH SHORT-CIRCUIT TYPES OF TESTER. VALUE OF INSULATION GREATLY REDUCED

Fig. 7 diagrams the theory of operation of the "type A" tester when applied to the upper cement of a three-shell insulator in order to test the top shell, as illustrated, for non-grounded type of construction, and Fig. 9 illustrates a similar condition of application on grounded construction of the line. The electrical connections of the "type A" tester consist of an air gap in series with a resonated local circuit and a capacity to ground with one terminal only brought out to a point which may be applied to the insulator under test. A sound is produced in the telephone if the potential above ground at the point of contact is sufficient to jump the gap and charge the telephone circuit, and the length of the gap indicates the value of such potential.

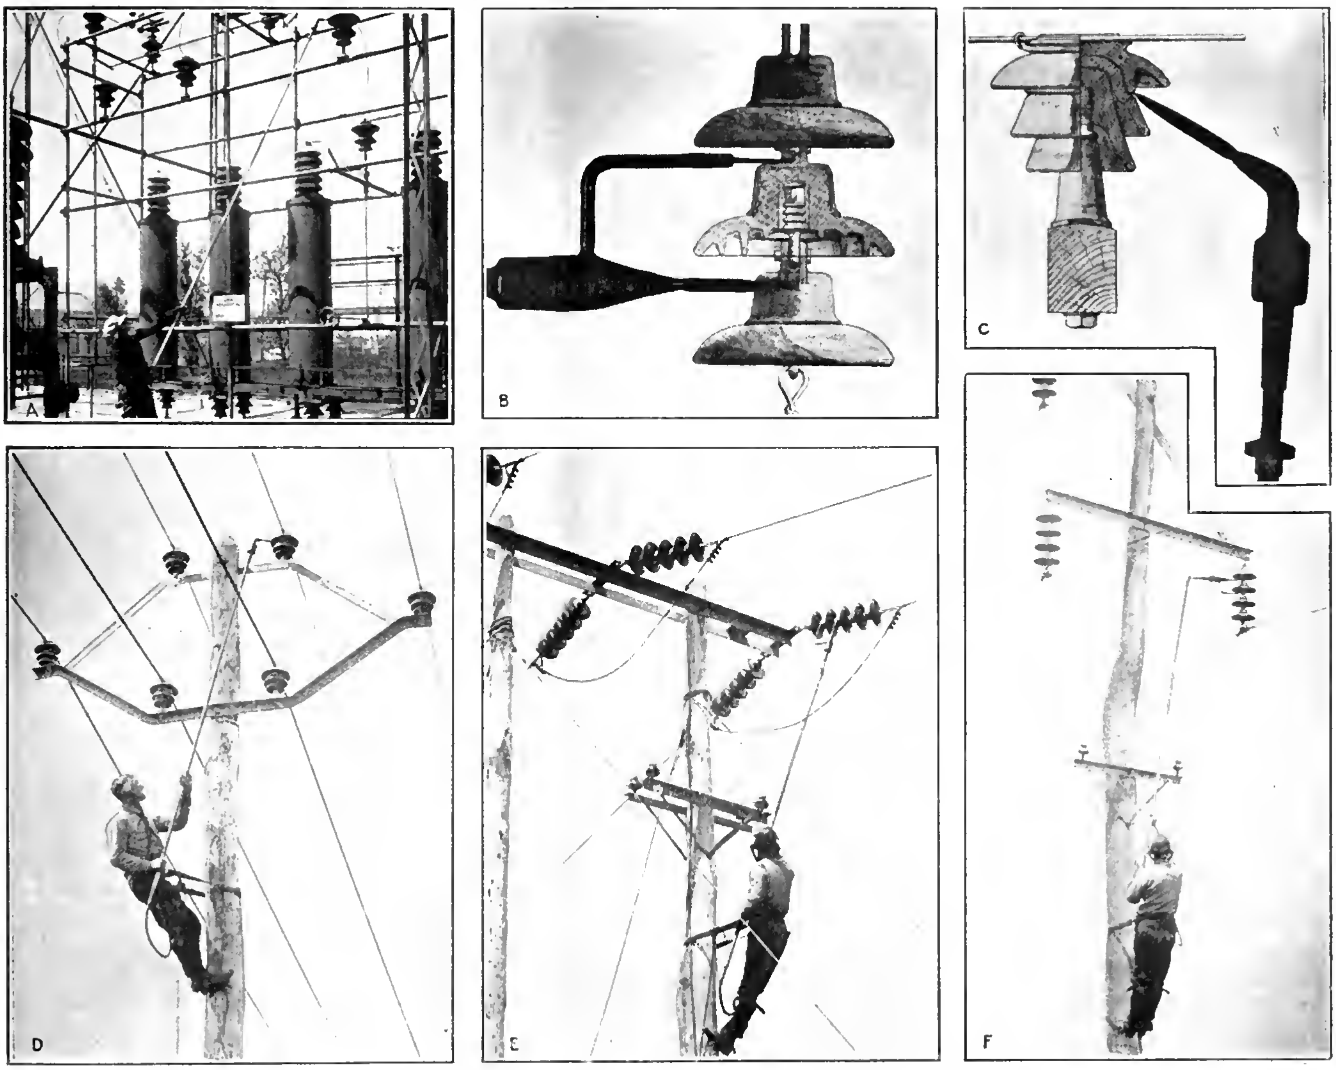
The application of the "type B" tester is shown in Fig 8. It is applied to the terminals of a disk-type insulator so as to test its condition when located in the middle position of a three-disk string. A sound is produced in the tester provided the potential across the disk under test is sufficient to jump the gap and charge the telephone circuit, and the length of the gap is an indication of the value of such potential. Fig. 10 illustrates a similar condition of application to a string of disk insulators on grounded construction, and the indication is the same as above.

The two types of the Doble insulated telephonic tester are each based on the same general principle of protection to the operator while listening, but they differ from each other in essential points of construction and application to an insulator under test. The "type A" outfit makes but a single contact with the insulator and is most widely used on pin-type insulators. The "type B" outfit is primarily designed for testing suspension or disk-type insulators.

In the "type A" tester a telephone circuit is inclosed in a case of hard rubber or other insulating material, and one side of this circuit is brought out through an air gap having a micrometer adjustment to a metal point which may be applied to a pin-type insulator. The other side of this circuit is a capacity effect to ground. The metal contact is the only part of the circuit which can be applied directly to the transmission line or live parts of the insulator under test. All other parts of the circuit are surrounded by an insulating medium having a higher dielectric strength than air. The introduction of the apparatus into the field around an insulator does not reduce the resistance of the leakage path over the insulator, and further, on account of the high insulation in the casing of the tester, it will not cause a short circuit or ground even on a very bad insulator.

A hollow tube of impregnated wood extends from the rubber case to any desired length, and a flexible rubber

hose connects the far end of this tube to a suitable head device for an operator. A continuous air column extends from the receiver diaphragm in the rubber case through the wooden tube and rubber hose to earpieces, which enable the operator to listen as with a stethoscope. A sound is produced in the telephone when the point is applied to a given part of an insulator, provided that the electrical conditions at this point are greater than some predetermined value. The air column through the insulating tube and the rubber hose conducts the sound to the ear of the operator in the manner



NEW METHODS OF TESTING INSULATORS ON LIVE LINES

Rapid advances in the testing of insulators under operating conditions in the field is indicated by the above illustrations.

A shows the short-circuit, air-gap method, in which the length of the gap across which the voltage stress will pass when a shell is "shorted" is compared with the voltage gap necessary to jump a normal insulator (see Fig. 6).

C shows the application of the Doble insulated telephonic tester to a pin-type insulator, the telephone indications being transmitted to the operator via air column through an insulated stick rubber tubing and ear pieces (see Figs. 7 and 9).

D is a field view of the above insulated telephonic tester as applied to a 25,000-volt, pin-type line forming part of the Boston Edison-New England Power Company interconnection trunk.

B shows an application of the Doble tester to the disk of a suspension type insulator, with air column transmission of telephonic indications as in B (see Figs. 8 and 10).

E shows the last-named equipment as applied to a 66,000-volt line equipped with disk-type insulators, in field service, and F shows this equipment as adapted to testing at different angles.

of a combination speaking tube and stethoscope, with perfect safety to the operator.

In operation no metallic connection exists between the telephone in the hard-rubber case and the operator. The impregnated wood tube is paraffine-treated for several hours and may be several feet long, depending principally upon the physical limitations of handling it and accurately applying the point to the desired part of the insulator. The rubber hose is made of 70 per cent Para rubber vulcanized like an automobile tire casing. Short sections of metal hose are inserted at either end of the rubber hose for added stiffness where the greatest wear occurs, owing to bending in use. This metal is not objectionable from an electrical safety standpoint when the set is in use, since it is not necessary to insulate the air column above or below the point at which the operator grasps the tube in order to manipulate the apparatus.

There is a very high insulation between the operator's headpiece and the hose coupling to the wood tube, owing to several feet of rubber hose without metal lining—a construction purposely adopted on account of the possible accidental contact of the hose coupling with live parts when the headpiece is in place on an operator while he is climbing up through other wires or working over other live circuits. This point of safety is not intended to encourage carelessness in the operator, but rather to be an added safeguard in the case of an unavoidable slip.

In operation the apparatus may be regarded in the same light as an impregnated switch stick and similar limitations may be put upon its use as regards the

length of tube necessary for a given voltage on account of separation and weather conditions. If grounding the tube at some point beyond the part normally grasped in use is thought to increase the safety of operation, this may be done without detriment to the efficiency of the tester, provided that a reasonable distance is left between the ground connection of the stick or tube and the telephone proper.

The electrical connections of the "type B" tester consist of an air gap *G* in series with a telephone circuit and a capacity with both terminals brought out to points which may be applied to an insulator under test. Fig. 8, as above described, shows the theory of operation of the "type B" tester, and the method of insulating and protecting the operator is the same as for the "type A" tester.

The value of the current in the "type B" tester is less than the charging or leakage current of an insulator under test, even though its condition is normal. This means that the tester in operation is an open circuit in terms of power current since every insulator on the line is leaking to ground at all times more current than passes through the tester even under maximum conditions.

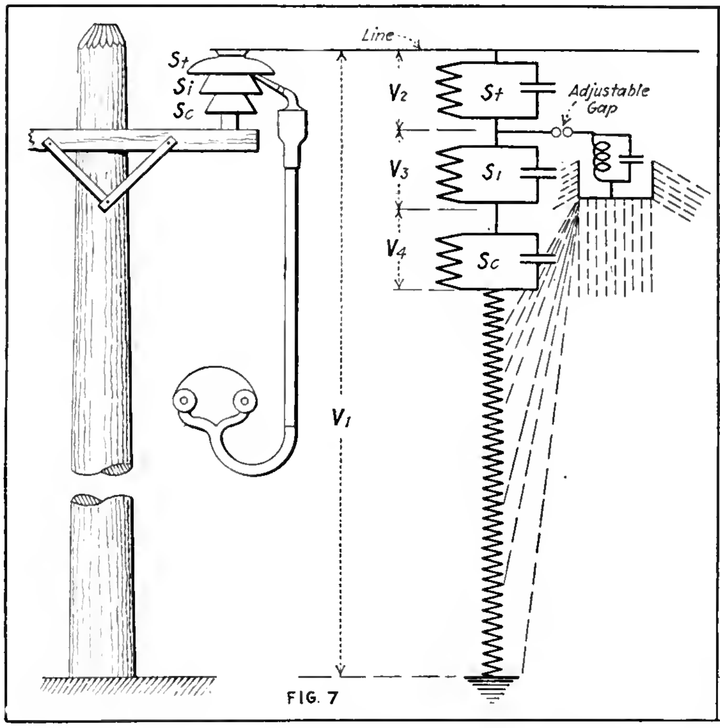
### Examples of Experience in Insulator Testing

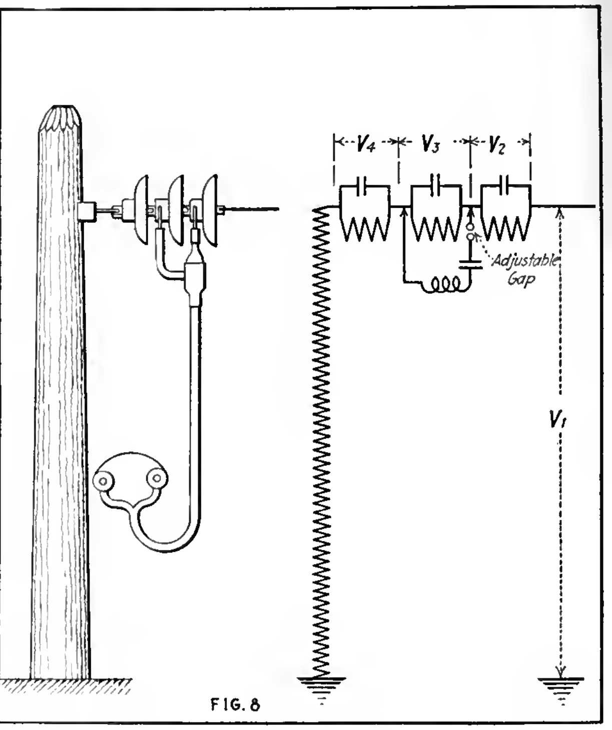
The following examples have been obtained from specific cases of testing:

1. A company operating several miles of 22,000-volt transmission line on fifteen-year-old insulators experienced eleven insulator failures over a period of eleven weeks, or an average of one per week. One test with the "type A" insulated telephonic tester showed about $33\frac{1}{3}$ per cent of the insulators to be bad. These bad insulators were replaced by good ones, and with the other two-thirds of old insulators still in service there were no failures during the nine months following, including three months of severe lightning.

2. *Case* 1—*On New Line.*—Tests made on a new 25,000-volt transmission line before putting it into regular service revealed that about 7 per cent of one type of insulators were bad.

*Case* 2—*Old Line Replacements.*—Tests were made on an entire system with the "type A" tester and several hundred insulators which were unquestionably bad were indicated and removed. The tests appeared satisfactory, but insulator trouble was not eliminated. Investigation revealed that a large percentage of the replacing insulators became very bad within a few months of installation. The insulators which had been taken from stock were not tested before being put on the line, and as a consequence the value derived from testing was greatly impaired. Several cases have proved the necessity for testing stock insulators before putting them in service.





FIGS. 7 AND 8—TESTING PIN AND DISK TYPE INSULATORS ON UNGROUNDED SYSTEMS

Fig. 7—Potential distribution over pin-type insulator with insulated telephonic type of tester and non-grounded type of construction. Value of insulation unchanged.

Fig. 8—Potential distribution over disk-type insulator with insulated telephonic type of tester applied around shell, non-grounded construction. Value of insulation unchanged.

3. *Case* 1.—Check tests on quite a number of three-shell, pin-type insulators were made in the field with the "type A" tester and the spark gap short-circuit method previously described and shown by Fig. 6. Several insulators checked as good or bad with both types of testers. One insulator indicated as follows: "Good" by five consecutive tests with the short-circuit tester; "bad" by five consecutive tests with the "type A" tester. This insulator was removed from service, and even though it was visually perfect, the top shell punctured in air at 21,000 volts when a good insulator should have required about 90,000 volts for puncture.

*Case* 2.—Tests on a 25,000-volt transmission line of three-disk strings were made with a "type B" tester by a power company's own lineman, to whom the tester was new and unfamiliar. Several insulators were indicated as bad and removed from service. At the test

laboratory all but three of these insulators were also indicated as bad by other tests. The other three insulators by every available test except high potential appeared to be good. Subsequently all three insulators punctured in air before they flashed over, which showed that the "type B" tester will indicate degrees of serious defect which can be detected by no other safe method.

4. *Case* 1.—Tests made on a 66,000-volt transmission line on several hundred pin-type insulators mounted on steel structures indicated about fifty insulators to be defective. Seven samples were picked at random from the fifty noted as defective in order to study them by laboratory test. Some of these showed visual cracks in the top shells, while others were visually perfect as a whole. Under high-potential test certain of these insulators immediately punctured the top shell and flashed the other shells, while other insulators which showed visual cracks appeared to flash over the whole insulator.

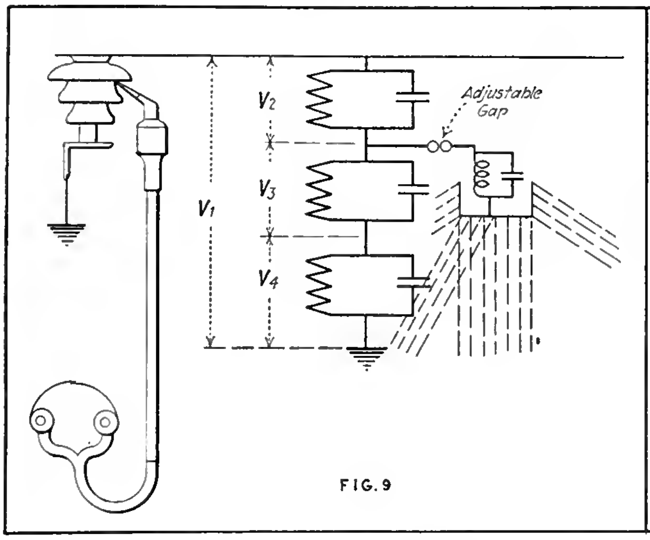


FIG. 9

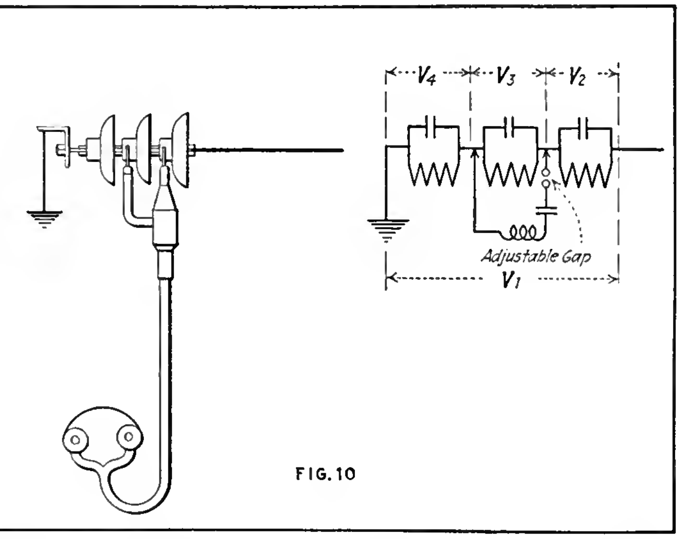

FIG. 10

FIGS. 9 AND 10—TESTING PIN AND DISK TYPE INSULATORS ON GROUNDED SYSTEMS

Fig. 9—Potential distribution over pin-type insulator with insulated telephonic type tester, grounded type of line construction. Value of insulation unchanged.

Fig. 10—Potential distribution over disk-type insulator, grounded type line construction, with insulated type telephonic tester. Value of insulation unchanged.

Owing to the fact that many companies accept their insulators by visual flashover tests, these results appeared to be seriously at fault. Further investigation revealed that the insulators which had cracked top shells and apparently flashed over actually punctured the top shell first and then flashed over. This was proved by taking one of these insulators and breaking out a considerable piece of the top shell, and then two or three inches of the tie wire was exposed directly to the first intermediate shell. With this piece broken out, the insulator flashed over at the same value as previously, namely, the normal flashover value for the intermediate and center shells without the top. This proves that visual flashover without reference to voltage is not an absolute criterion for judging deterioration.

*Case* 2.—Tests made by a power company on a 25,000-volt transmission line with "type A" tester on 17,000 insulators indicated about 2 per cent as defective. When removed from service many of these insulators were visually perfect and under high potential test apparently flashed over. Further study revealed that every insulator indicated as defective by the "type A" tester was unquestionably bad and that the apparent flashover was in reality the same misleading effect just described.

The question has been raised whether any danger exists of causing a short circuit in the presence of the operator while applying the "type B" tester to the controlling good disk in a string of suspension insulators. The chances of such trouble are practically nil. To produce a flashover arc in this way the test apparatus would have to be broken down inside without the knowledge of the operator. This is a remote possibility as the normal operation of the test apparatus gives a continuous check upon its condition. There is really no more chance of a flashover from the above cause than there is of a flashover in the face of an operator who has occasion to approach a live line with all outward indications of normal operating conditions upon the circuit.

On low voltages there is a remote possibility of a crack defect which will not change the voltage distribution over a perfectly dry insulator in any measurable amount and yet the crack may be plainly apparent to the naked eye. No known testing apparatus will locate such a defect except by impressing a potential on the insulator about normal working value. Any such high-potential method is very dangerous if used on a live line.

## CONCLUSIONS

Every transmission-line insulator should be tested in the field before being placed in service and every insulator in service should be tested periodically, say every six months to two years, according to the line voltage, age and condition of the insulators.

Live-line testing is most satisfactory from standpoint of cost and efficiency. It should meet the following safety requirements: Protection to operator from direct shock; protection to insulator under test from short circuit of its parts; reduction in leakage path; potential in excess of normal operating value.

Results in the field show that insulated telephonic testers will indicate defective insulators on live lines, and that some standards for testing must be agreed upon to determine when an insulator is bad enough to warrant its removal from service. This is difficult but essential if uniformity is desired.

# Why Electric Heat Treating Is Economical*

## Actual Comparisons Show an Economical Field for Application of Electric Heat to Industrial Processes Even with Present-Day Relative Costs of Fuel and Electricity—Energy Cost Is Not the Only Consideration, However

By E. F. COLLINS
*Consulting Engineer Industrial Heating Department, General Electric Company*

MANY manufacturers, engineers and executives unfamilar with the possible economies of industrial electric heating dismiss it from serious consideration on the theory that it is expensive and impracticable. However, such is not the case. Electric furnaces designed for 1,600 deg. F. operation, when properly constructed and applied, give thermal efficiencies around 80 per cent so that 16 per cent of the B.t.u.'s in coal burned to generate the electrical energy could be effective in heating the metal if the power is generated in a large central station. Furthermore, electric forge furnaces operating around 2,300 deg. F. can utilize 10 to 12 per cent of the B.t.u.'s in the coal used to generate electrical energy, since the efficiency of the furnaces alone is 50 to 60 per cent. These thermal efficiencies compared with 9 per cent for a fuel-fired forge are worth serious consideration. When the electric furnace or oven is used for drawing at lower temperatures its efficiency may easily be above 80 per cent, hence showing still greater economy over the smithy forge than indicated above.

Passing from the smithy forge to the more modern type of furnace, it may be interesting to look at some efficiencies which may be obtained in the consumption of fuel by the direct-burning process—that is, utilizing it direct in the furnace in which the material is to be treated—and, on the other hand, burning it under the central-station boiler and finally heating the furnace in which material is being heat-treated by electric heat properly applied. The accompanying charts illustrate what may be accomplished in this way as between electricity produced by the central station burning coal and the furnace burning oil directly in the chamber in which material is being heat-treated.

Fig. 1 shows the B.t.u. costs for an electric as against an oil-fired furnace for heat treating. The left-hand square represents 20,000 B.t.u. which may be purchased with oil at 7 cents per gallon. With an oil furnace having an efficiency of 16 per cent, which is better than the average, it may be expected to put 3,400 B.t.u. of the 20,000 B.t.u. into the charge. Now, with coal at $5 per ton, the central station may expect to get 1 kw.-hr. from 1.5 lb. of coal, or a coal cost of 0.425 cent. Adding the overhead charges of the central station, there results about 3,840 B.t.u. in electricity for 1 cent. If this electricity be used in the electric furnace with 80 per cent efficiency, there will be utilized in heating the charge 3,400 B.t.u. In other words, with oil costing 7 cents at the burner and coal $5 at the boiler, one just about breaks even on a B.t.u. cost basis with electric heat and with oil when prices as given for coal and oil prevail. The above is for furnace temperatures of about 1,600 deg. F., such as are required for heat-treating steel.

*Based on paper read in Boston before the American Society for Steel Treating.

It is likewise interesting to compare costs for baking enamel at 450 deg. F. in the electric oven and by a process which is at present being promoted, namely, the so-called "indirect-oil" heating scheme. In this "indirect-oil" baking process the oil is burned under or outside a muffle. Through the muffle air is forced and heated to about 800 deg. F. and passed into a japanning oven over the work, so baking it.

In Fig. 2 one square represents the cost of 17,000 B.t.u. when oil is selling for 8 cents per gallon. The efficiency of the oil heater is 75 per cent, and hence 12,800 B.t.u. is sent to the oven in the heated air. The oven efficiency for this method of heating is by test 12 per cent. Hence 1,540 B.t.u. is actually effective in heating the charge at a cost of 1 cent, neglecting the overhead cost of burning the oil. The above cost represents cost of oil at the burner as 8 cents. Fig. 3 shows the relative cost of upkeep of the electric oven as compared with the "indirect-oil" system. Correction must

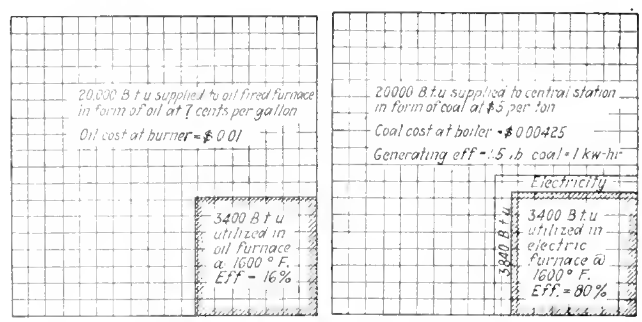

Fig. 1

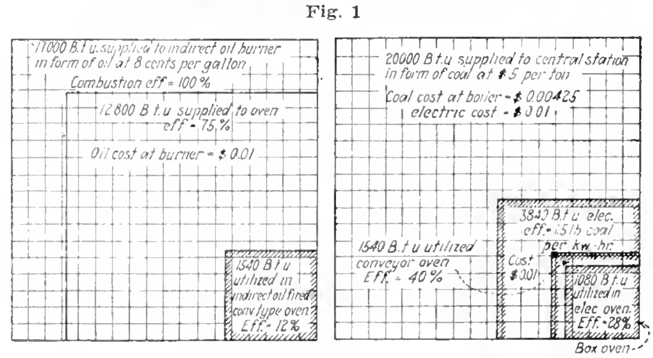

Fig. 2

FIGS. 1 AND 2—B.T.U. COSTS OF HEAT TREATING, ELECTRIC VERSUS OIL-FIRED FURNACE

be made for this overhead to get comparative costs of electricity and of oil heat for baking.

Referring again to Fig. 2, the right-hand square represents 20,000 B.t.u. in coal at the boiler of the central station, costing 0.425 cent with coal at $5 per ton. Assuming an average overhead for the central station, the cost of electricity may be taken at 1 cent per kilowatt-hour, or 3,840 B.t.u. for 1 cent. Using this 3,840 B.t.u.

in the electric japanning oven, one actually utilizes 1,540 B.t.u. in baking the charge at a cost for power of 1 cent. Hence on a B.t.u. basis it may be expected that one will break even on cost when the above conditions exist. The above has been said to show why the actual test results recorded in Fig. 3 are so greatly different from the sixteen-to-one rates arrived at by the offhand reasoning mentioned above.

It will be seen that the actual test results of Fig. 3 are to be expected after analyzing the problem as per Figs. 1, 2 and 3. For in Fig. 3 oil costing 8 cents at the burner gives the same over-all cost on a B.t.u. basis as electricity at 1 cent per kilowatt-hour gives for baking japan at 450 deg. F.

It must not be forgotten that the efficient generation and utilization of a heat unit is usually quite different for the electric and the fuel-fired furnace under starting conditions, and it must also be remembered that, even with perfect combustion of fuel, which seldom exists, a large percentage of generated heat leaves the metallurgical furnace as flue gas without doing useful work. In practice 50 per cent excess air is not unusual, and this increases the flue-gas loss and lowers the combustion efficiency to a very remarkable degree as one passes from low to high temperatures.

### Over-All Cost and Not Heating Cost Is Important Factor

While these illustrations show that there is a field for electric heat with present-day relative costs as between fuel and electric heat, it is not intended here to contend that electric heat under all conditions and in all places is suitable to replace fuel heating. However, it is a matter of no distant time when the use of electric heat for important thermal and metallurgical processes will be adopted with no more hesitation than now occurs when the householder decides in favor of the electric light for his home as against the gas lamp, even though the cost of energy consumed be greater than that of gas.

It matters little what the cost per B.t.u. for a given heating process is so long as the over-all cost of manufacture, quality of product and working conditions are unaffected. If process conditions, quality of product and production were increased by using electric heat, one would be justified in accepting generally a higher B.t.u. cost for the sake of gaining these advantages. Fortunately for electric heat, many such advantages are inherent in its use. These will, of course, vary with the application and local conditions. Hence a study of all the factors involved should be made when deciding whether electric heat or fuel heat should be used. That these factors are of extreme importance is proved by the very fact that industrial electric heating is rapidly increasing in the face of the widespread misunderstanding previously noted.

Many times a single factor contributes savings sufficient to overbalance any possible higher cost of electrical energy. In some extraordinary cases a rate of 75 cents per kilowatt-hour would still leave the electrically heated equipment superior to the fuel-fired equipment.

### Perfect Heat Generation

The cost of burning fuels varies widely, depending upon the amount of air admitted to the furnace and the resultant combustion; for example, the cost of city gas per 100,000 B.t.u. effective rises to double its value with an increase of 50 per cent in air, and such excess percentage of air is by no means rare. Fuel oil likewise increases its cost roughly four times at the same temperature (2,800 deg. F.) and the same excess of air (50 per cent). Hence it is seen to how great an extent the economic operation of the fuel furnace is in the hands of the operator. This handicap does not exist with the electric furnace, where the ratio of conversion from power to heat is 100 per cent perfect and the operator cannot affect this efficiency of conversion.

A brief outline and summary of some of the more important features of electric heating which distinguish it from fuel-fired equipment follows:

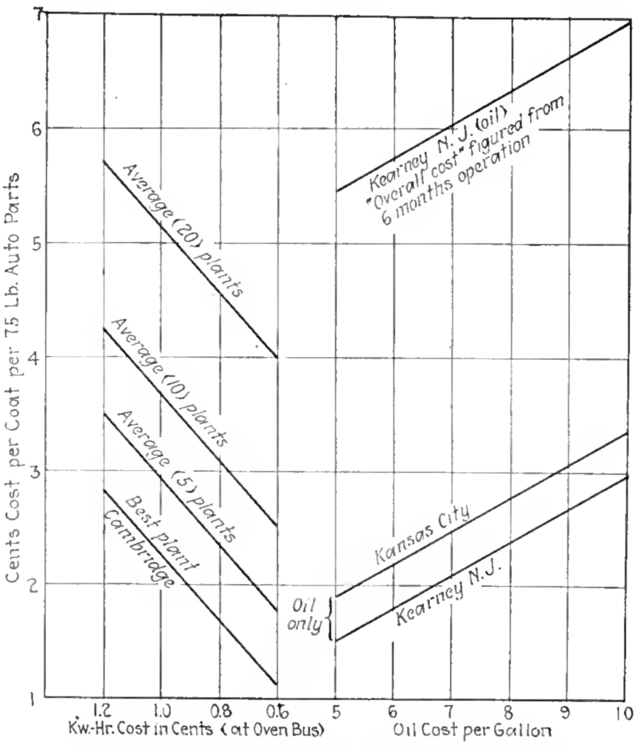

FIG. 3—COMPARISON OF UNIT PRODUCTION EXPENSES WITH ELECTRIC AND OIL FURNACES

1. *Heat Generation:*
   (a) Released at points to give uniform or non-uniform temperature.
   (b) Heat generation balanced against heat absorption.
   (c) Heat generated at or near potential of heating chamber.
   (d) Generated in inactive or dead atmosphere; no contamination of charge. Heating chamber may be a vacuum or under heavy pressure. Artificial atmosphere possible, as hydrogen gas, nitrogen gas and non-combustion gases.
2. *Heat Conservation Resulting in High Thermal Efficiency:*
   (a) High heat lagging, no local high temperatures.
   (b) Small heating chamber and no combustion chamber.
   (c) No hot gases leaving furnace, save for ventilation when necessary.
   (d) Automatic control of temperature so that supply balances demand.
3. *Method of Electric Heat Transmission and Delivery to Charge:*
   (a) Convection of liquids and gases (natural).
   (b) Circulation of liquids and gases (forced).
   (c) Radiation and convection in air.
   (d) Direct radiation to work.
   (e) Direct and reflected radiation to work.
   (f) Heat generated directly in charge by current flowing through it.
   (g) Complete heat saturation of charge without surface overheating, due to perfect automatic heat control.

Many successful working installations of electric heat exist today, and it is predicted that many more industrial processes will be improved and made more economically productive by its application.

A considerable demand comes from manufacturers of automobile parts, such as gears, crankshafts, bearings, axles, etc., which are produced in large quantities and all of which require heat treatment. Many tons of steel are heat-treated each day; therefore the demand for furnaces of large productive capacity and high efficiency. Electric furnaces have long been recognized as ideal for this purpose, but until the last few years they have not been available in such size and of such rugged design that they could be considered for carrying unassisted their regular production load.

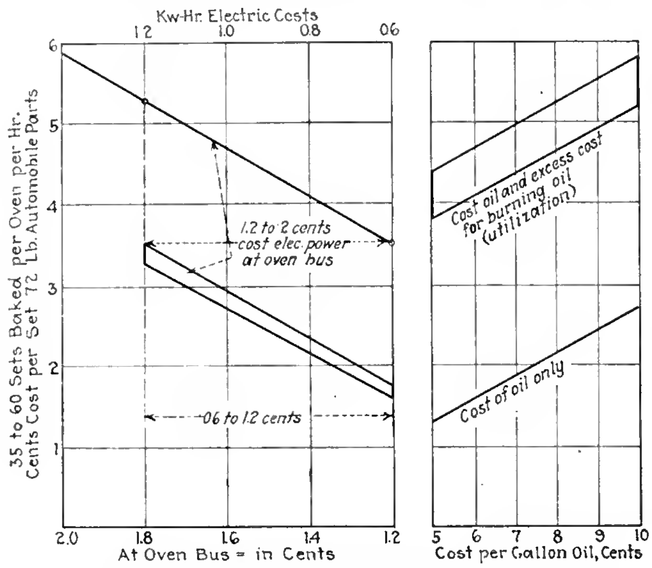

FIG. 4—COMPARATIVE COSTS OF OPERATION USING ELECTRIC AND OIL FURNACES

Several manufacturers now appreciate the possibilities of the industrial electric heating field and are making installations at an increasing rate. Equipment is available in practically all capacities for temperatures up to and including 1,800 deg. F. and suitable for many industrial processes.

A type of metallic resistor furnace entered the industrial field in 1917 and 1918, and its use has been attended with unusual success in regular manufacturing production. It was first tested under the rigorous conditions attending gun making in war time, and the results produced were phenomenal.

A basic idea incorporated in the design is the location of the resistor ribbon, unmuffled, in the open heating chamber so that it can directly radiate the heat generated within it.

These ribbons are very rugged mechanically. They are sometimes as much as 1½ in. wide by ⅛ in. thick and are formed into loops. They are supported on refractory insulating members projecting from the walls of the heating chamber, the body portion of the support being embedded in the wall.

The resistor is thus free to deliver its heat by radiation to the charge without the necessity of first forcing the heat through the walls of a muffle, as has been the practice in most metal resistance furnaces heretofore constructed.

In order to force heat through a muffle at high rate and insure rapid heating of the charge, a high temperature gradient and therefore high resistor temperature are necessary. Hence the unmuffled furnace has inherently a lower temperature resistor, produces quicker heating and is much less sluggish in point of temperature regulation than the muffled or screened furnace doing the same work. The unmuffled furnace uses direct and reflected radiant heat.

There are many small installations the importance of which to many shops cannot be overlooked. There is a large growing demand for small self-contained tool-room ovens and furnaces for tempering and hardening tools, cutters, etc.

## ADVANTAGES OF ELECTRIC FURNACES

The electric furnace is suited to any heating requirements where the charge does not require that more than 1,800 deg. F. be available. Some of its advantages over fuel-fired unmuffled furnaces are as follows: (1) Radiant heat; (2) satisfactory heat distribution; (3) automatic control of temperatures if desired; (4) small amount of heat given off to the room; (5) no products of combustion or obnoxious gases given off to heating chamber or room; (6) ratio of heat generation to heat absorption by charge correctly maintained; (7) uniform and complete penetration of heat through charge without overheating of corners, fins or surfaces; (8) ability to repeat desired heat cycles, giving uniformity of product; (9) a reduction, generally, in labor; (10) a better over-all economy and the production of higher quality product at the same or slightly higher cost and often of the same quality at a lesser over-all cost.

The accompanying table shows what may be done with the electric furnace in moderate scale operations. The time required to heat these charges was five and one-half to six hours, and the maximum diameter of forgings was 16½ in. The furnaces were 24 ft. high by 6 ft. diameter inside dimensions, the connected load being 400 kw. each. The ultimate or minimum radiation from test was found to be 70 kw. The predicted radiation from design was 75 kw., which is a satisfactorily close agreement.

The actual operating results for four furnaces for the month of October, 1918, when production was at the maximum rate, including both hardening at 1,450 deg. F. and drawing at 1,150 deg. F., was \$2.76 per ton, based on the power rate of \$0.0085 per kilowatt-hour.

The specifications for drawing did not allow the charge to enter a furnace at full drawing temperature. It was therefore necessary to cool the furnace somewhat and then raise the temperature of furnace as well as charge. It was also required that the charge be held at the drawing temperature for several hours. This of course did not allow of the highest efficiency in pounds of metal heated per kilowatt-hour.

If work at 250 deg. F. to be drawn at 1,100 deg. F. enters a furnace at 1,100 deg. F., a yield of approximately 24 lb. per kilowatt-hour would be realized. This

RESULTS OF TESTS RUN ON AN ELECTRIC FURNACE INSTALLATION INVOLVING THE METALLIC TYPE OF FURNACE

Heating to 1,450 deg. F. Furnaces hot when charged. Furnaces 6 ft. in diameter by 24 ft. high; voltage, 440, 60 cycles, capacity 400 kw.

| Charge | Total Weight, Including Holding Fixtures, Lb. | Energy, in Kw.-Hr. |
|---|---|---|
| Twelve 3-in. gun tubes | 21,900 | 1,874 |
| Seven 4-in. gun tubes | 22,300 | 1,880 |
| Three 4-in. jackets | 21,700 | 2,088 |
| Total | 65,900 | 5,842 |

Average pounds per kw.-hr. (65,900 ÷ 5,842) = 11.25
Kw.-hr. per ton (2,000 ÷ 11.25) = 173
Energy cost per ton at \$0.0085 per kw.-hr. = \$1.52

would give 2,000 ÷ 24 = 84 kw.-hr. per ton for drawing to 1,100 deg. Fahrenheit.

Therefore the over-all operation required: To harden, 178 kw.-hr per ton for heating to 1,450 deg. F.; to draw, 84 kw.-hr. per ton for heating to 1,100 deg. F., making a total of 262 kw.-hr. per ton.

The cost of $0.0085 per kilowatt-hour is $2.23 per ton. The cost of $2.76 per ton actually achieved during the month of October, 1918, indicates that the furnaces performed exceptionally well.

It is not to be inferred that electric heat is without a competitor in all places and under all conditions. There are, however, a very great number of applications which may be carried out electrically with advantage. These applications in various processes occur with so great frequency that it behooves the user of furnaces to question his engineer thoroughly concerning the possibilities of electric heating before revamping existing installations or adding new heating equipment which employs fuel-fired heating methods.

## Increased Activity During April

INDEX figures upon which the "ELECTRICAL WORLD Barometer of Business Conditions in the Electrical Industry" is based indicate another record operation within the industry during April. Activity in the building trades continues to characterize April business as it did that of March, and pig-iron production, generally regarded as the most accurate single indicator of productive activities, made a new high record in that month, exceeding the previous record production reported during March.

The basic data upon which the "ELECTRICAL WORLD Barometer" is based indicate an increase of 3.2 points on the barometer scale as compared with March activities. During this interval the industry has grown 1.5 points, leaving a net increase in activity of 1.7 points on the barometer scale as compared with March. The electrical industry, as a whole, was operating in April at 29.6 points or per cent above what would have been the point of seasonal demand if growth in the industry had been normal. In March it was operating at 27.9 points or per cent above the point of normal demand.

# Large Use of Diesel Engines by Arizona Mining Company

### Twenty-four, Aggregating 33,000 Hp., on Properties of Phelps-Dodge Corporation, Show Good Operating Economy

BY C. LEGRAND
Consulting Engineer Phelps-Dodge Corporation, Douglas, Ariz.

DIESEL engines are comparatively new in this country and while they may not be regarded as entirely past the experimental stage, still at the same time they are being successfully operated in many large plants. One of the largest single users of Diesel engines is the Phelps-Dodge Corporation, which employs them in its various mining properties in Arizona and New Mexico. So satisfactory has been this company's experience with Diesel engines that early last year a large part of the power load of the Bisbee district was taken over by a battery of these engines in the power plant near the site of the new concentrating mill.

At the present time there are five installations, as follows:

*Tyrone.*—Four five-cylinder, 1,250-hp. engines, direct-connected to 60-cycle, three-phase, 850-kw. generators; two three-cylinder, 750-hp. engines, direct-connected to 3,700-cu.ft., 95-lb. air compressors.

*Morenci.*—Three five-cylinder, 1,250-hp. engines, direct-connected to 60-cycle, two-phase, 850-kw. generators; one five-cylinder, 1,250-hp. engine, direct connected to a 6,400-cu.ft., 100-lb. air compressor.

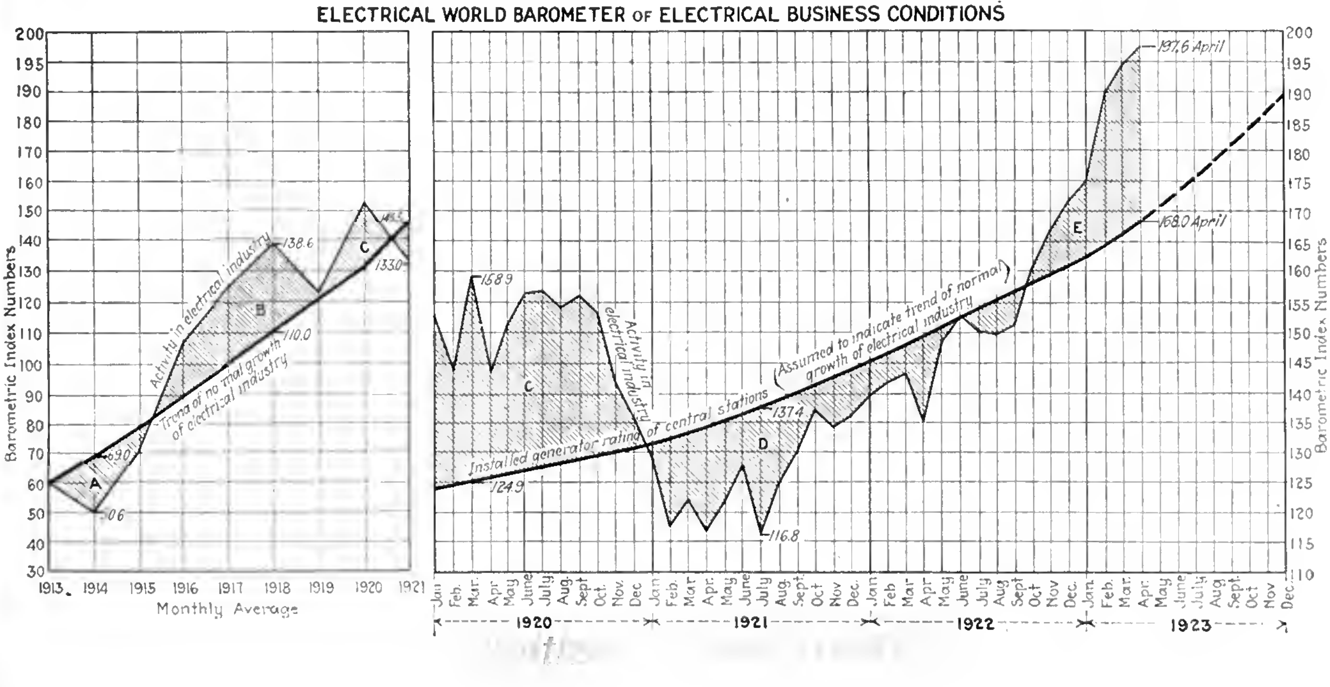
*Nacozari.*—Two four-cylinder, 2,000-hp. engines, direct-connected to 60-cycle, three-phase, 1,500-kw. generators; four five-cylinder, 1,250-hp. engines, direct-connected to 60-cycle, three-phase, 850-kw. generators; two three-cylinder, 750-hp. engines, direct-connected to 4,000-cu.ft., 95-lb. air compressors.

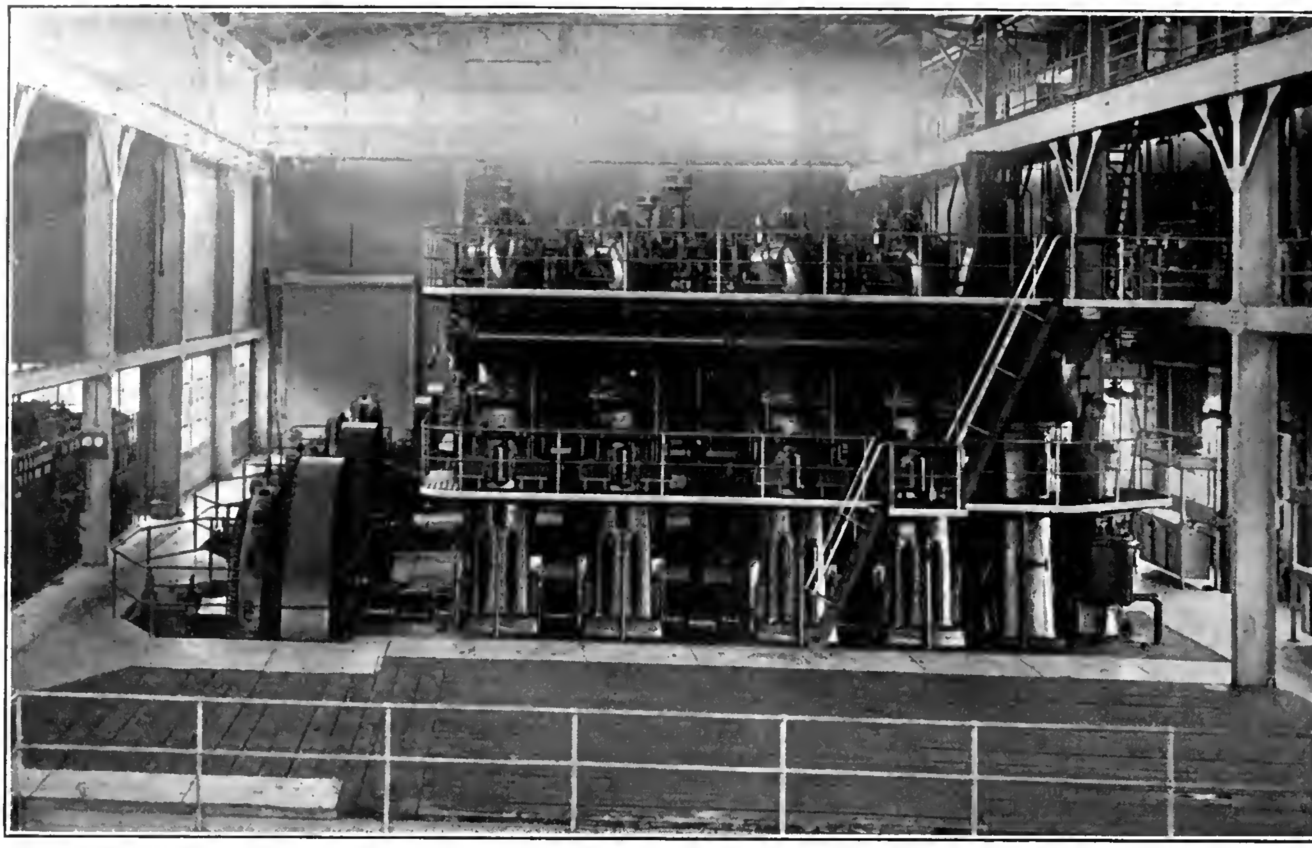
*Bisbee.*—Two four-cylinder, 2,000-hp. engines, direct-connected to 60-cycle, three-phase, 1,500-kw. generators; two five-cylinder, 1,250-hp. engines, direct-connected to 60-cycle, three-phase, 850-kw. generators.

*Globe.*—Two five-cylinder, 1,250-hp. engines, direct-connected to 60-cycle, three-phase, 850-kw. generators.

These ratings are for sea-level conditions, and the actual power is slightly reduced at the elevations where the engines are used, which vary from 3,500 ft. to 6,000 ft.

ELECTRICAL WORLD BAROMETER OF ELECTRICAL BUSINESS CONDITIONS





DIESEL ENGINES AT THE POWER PLANT OF THE PHELPS-DODGE CORPORATION, BISBEE, ARIZ.

A double system of fuel-oil pipe is used, one supply for starting oil, which has to remain fluid at the lowest temperature liable to be reached in the power plant, and the other for running oil, which can be any oil that will be fluid at the temperature to which it is practicable to heat it. The piping for both oil systems is arranged with an internal heating pipe through which hot water is circulated to heat the fuel oil, and by using the discharge water from one of the exhaust-pipe cooling jackets there is no difficulty in keeping the oil at 140 deg. F. when the engine is operating at one-half load or over and the piping is properly insulated.

### Each Unit Is Self-Contained

Each engine drives its scavenging pump and a high-pressure air compressor for fuel injection and is a complete unit in itself except that the cooling water goes to a common pump and is repumped to a cooling tower by one or more pumps independent of the engine. The 250-hp. cylinders have 20¾-in. bore and 26-in. stroke and operate at 180 r.p.m. The 500-hp. cylinders have 28-in. bore and 44-in. stroke and operate at 120 r.p.m.

Since the plants were put in operation California 14 deg. Baumé fuel oil or Mexican 14 deg. Baumé oil has been used for running oil except for a short period when Mexican oil deliveries were stopped. The Mexican oil contains as much as 4½ per cent sulphur and averages about 3¾ per cent. This increases the difficulties of cylinder lubrication and the maintenance cost of the cylinders and piston rings.

The cooling water has an important bearing on the running costs of the engines. If the water carries scale-forming impurities, the scale formed in the cylinder heads and pistons increases considerably the cracking of these parts, not only through the heat-insulating properties of the scale but also by the loose scale plugging water passages and stopping the circulation of water.

### Fuel Economy

The fuel economy of the engines is good. Including the exciter losses for the generator, a 1,250-hp. engine delivers a kilowatt-hour at the switchboard with a consumption of 0.69 lb. of fuel oil at loads between 600 kw. and 700 kw. The 2,000-hp. engines use 0.67 lb. of fuel oil per kilowatt-hour at loads between 1,200 kw. and 1,500 kw. On the basis of 14 deg. Baumé Mexican fuel oil averaging 18,500 B.t.u., which was used in these engines, the fuel economy of the 1,250-hp. engines is 12,800 B.t.u. per kilowatt-hour, and on the 2,000-hp. engines it is 12,400 B.t.u. per kilowatt-hour. The power required to operate the auxiliaries of the plant such as water-circulating pumps, fuel-oil-handling pumps, lighting, etc., is from 2 per cent to 5 per cent of the total output according to the local conditions.

In practice the fuel consumption is from 5 per cent to 20 per cent higher than shown on test runs for the load corresponding to average load on the engines, depending upon the load factor on the engines and the plant and on the number of times the engines are stopped and started. For example, at Globe during the first five months of last year the average load per engine running was 587 kw.; the peak load carried exceeded 900 kw. per engine, and the fuel consumption was 0.763 lb. per kilowatt-hour generated. In this case the test curve showed a consumption of only 0.695 lb. of oil per kilowatt-hour for a load of 587 kw. At Morenci, after making proper allowance for excitation of generators, the fuel consumption in the same period was 0.795 lb. per kilowatt-hour, generated with an average load of 511 kw. per engine running, the test curve showed 0.72

lb. per kilowatt-hour. At Tyrone, with a very steady load, but where one engine is running only eleven hours per day, the fuel consumption is 1.25 lb. per kilowatt-hour for an average load of 236 kw., the test curve showing 1.04 lb. for this load.

### OPERATING COSTS

The cost of power obtained from these plants is encouraging and justifies the use of the Diesel engine where fuel is expensive and the load on the plant does not exceed 5,000 kw. The maintenance costs of these Diesel plants is high, but they were started at a time when all costs were high. It has been necessary to train operating crews, as none were available, and the cost of this training is reflected in the maintenance costs.

A Diesel plant reaches its average maintenance cost quickly, probably in about three years, while steam plants do not reach their average condition for about fifteen years. In making comparisons between the two types of plants this point must not be overlooked, nor the fact that the Diesel plant is comparable to a complete steam plant, including condensers, boilers, economizers, etc. There is no doubt that with more experience, with a greater supply of trained operating labor, and with the cost of repair material coming down, maintenance costs will be reduced.

The operating costs for the first five months of last year at Globe and Morenci, which are the only two plants running under a fair load condition, and at Tyrone, which shows a non-producing plant running under very unfavorable conditions, are as follows:

*Globe.*—Total cost per kilowatt-hour distributed, $0.00878, of which operating labor is 17 per cent and fuel oil 69 per cent.

*Morenci.*—Total cost per kilowatt-hour distributed, $0.00877, of which operating labor is 18 per cent and fuel oil 60 per cent.

*Tyrone.* — Total cost per kilowatt-hour distributed, $0.01968, of which operating labor is 41 per cent and fuel oil 47 per cent.

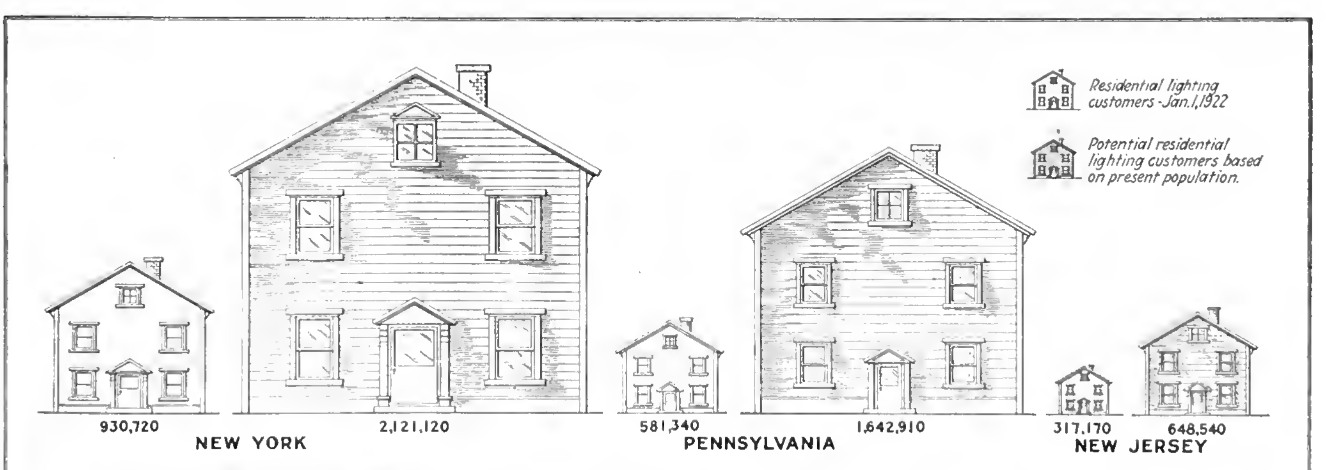
These costs include no taxes or general overhead expense, but all supplies and labor include the overhead expense of supply and mechanical departments. They are per kilowatt-hour available outside the power house for distribution to power users. They are low as regards repairs, which, at present prices of repair materials and taken over a sufficiently long period of time to cover major periodical repairs, would probably be increased $0.001 per kilowatt-hour distributed from the switchboard.

# Almost Six Million Potential Customers in Middle Atlantic States

### "Electrical World" Estimate by Counties of Present and Possible Future Consumers of Electricity in the Middle Atlantic States Indicates that There Are More than Two and One-half Million Homes in This Section Yet to Be Electrified

NEW YORK, New Jersey and Pennsylvania, comprising what is commonly termed the Middle Atlantic Section of the country, present perhaps the most concentrated field for the future growth of the electric light and power industry to be found in this country or in the world. In 1920 this section, comprising only 3.4 per cent of the total area of the United States, had a population of 22,261,144, or 21.1 per cent of the total population. This gave the section a population of 222.6 persons per square mile, or double that of any other section. Almost three-quarters of these people live in cities and towns, and the section contains seven cities with a population in excess of 250,000.

The distribution of the present number and the potential number of central-station customers among the various counties of these three states is given in the accompanying tabulation. This study is based upon



THE LARGER CITIES OF THE MIDDLE ATLANTIC STATES OFFER A LARGE FIELD FOR THE SUBSTITUTION OF ELECTRIC LIGHT FOR GAS LIGHT IN DWELLINGS

# Present and Potential Central-Station Customers in the Middle Atlantic States by Counties

| State and County | Population (Census of 1920) | | | Domestic Lighting Customers | | Commercial Lighting Customers | | Industrial Power Customers | |
|---|---|---|---|---|---|---|---|---|---|

* Cities and towns over 1,000 population.

reports which have been received by the ELECTRICAL WORLD from operating companies representing about 70 per cent of the installed generator rating of the country, supplemented by population and industrial power data issued by the United States Census Bureau. The data obtained in this way were in each case referred to a representative company operating in the county concerned with a request that an opinion be given as to whether the data represented with a fair degree of accuracy conditions existent in that county. In the few cases where the company to which the figures were sent indicated that the ELECTRICAL WORLD figures were at variance with conditions in the county a new study was made and the data were corrected accordingly. The figures for the various counties, although estimates, are believed to indicate very clearly the present and future potentialities of the counties as ultimate purchasers of electrical apparatus, appliances and supplies.

A similar tabulation showing the distribution of the central-station customers in New England was published in the April 28, 1923, issue of the ELECTRICAL WORLD, and studies are under way covering other sections of the country.

## Radio Telephony in South America

IN SANTIAGO, Valparaiso, and several smaller Chilean cities interest in radio telephony is growing steadily, and its fuller development only awaits the establishment of a broadcasting station within the country such as those now in operation on the east coast of South America, says Assistant Trade Commissioner W. E. Embry in a report to the Department of Commerce.

It is reported that broadcasting stations recently erected in Buenos Aires, Montevideo and Rio de Janerio are giving very satisfactory results, and large numbers of amateur receiving sets have been sold in these countries. This is especially true of the Argentine, where conditions for broadcasting programs are almost ideal as the land generally is flat and radio transmission carries all over the River Plate district, Uruguay and in southern Brazil on the north and as far as the Andes on the east. For this reason the sale of radio equipment has met with great success in that country, and it is now estimated that there are approximately twenty-five thousand sets in the Argentine Republic, in comparison with about one hundred less than one year ago.

# Davis Bridge Development of the New England Power Company

## Another Step in "Electrification" of Deerfield River—Ultimate Yield of Watershed 200 Kw. per Square Mile—High-Voltage Trunk Line to Load Center of System—Flexible Double Switching Yards

By A. C. EATON* and E. B. COLLINS†
*New England Power Company, Worcester, Mass.*

THERE is under way at present in New England a project involving the eventual complete utilization of the hydro-electric possibilities of the Deerfield River. Back of it stands the New England Power Company. Nine generating stations will be placed along the river ultimately, which will have an installed capacity of 110,000 kva. and an annual output of nearly 400,000,000 kw.-hr. Yet the river is small, having a drainage area of only 550 square miles.

Of the planned number, four stations are completed and the Davis Bridge development is nearing completion. The last named project is at Whitingham, Vt., and will consist of a storage reservoir having a usable capacity of 111,000,000 acre-feet and a plant with an installed capacity of 60,000 hp., operating under a mean head of 350 ft. The reservoir, together with the completed Somerset reservoir, with its 58,000 acre-feet, will regulate the river flow for the Davis Bridge plant, the four completed plants and the four projected plants.

The Davis Bridge development extends fourteen miles along the river and its dam is built about 3 miles above Readsboro. The dam will impound water for 9 miles, causing about 2,200 acres of land to be flooded. A tangent, concrete-lined tunnel 2½ miles long and the equivalent of 14 ft. in diameter extends through rock to the power house below Readsboro. The earth dam, when completed, will be 200 ft. high, 1,200 ft. long and about 1,200 ft. wide at the base. With its 2,000,000 cu.yd. of earth it will be a mammoth structure and will be one of the highest dams of this type, if not the highest, in the world.

A tunnel with a diameter equivalent to 22½ ft., with a capacity of 20,000 sec.-ft. and 1,200 ft. long, was constructed under the left bank of the river to carry the water while the dam was under construction. Because of the narrow valley, a circular spillway is being constructed about 350 ft. upstream from the center line of the dam. This spillway is 160 ft. in diameter and discharges into a vertical shaft 22½ ft. in diameter and 180 ft. deep. The shaft in turn discharges into the lower end of the temporary bypass tunnel, which will be plugged at its upper end upon completion of the dam. A model of the spillway was made and tested to verify design calculations and to determine certain details of the design.

### USE OUTLET CONTROL TOWER

The flow of water to the power tunnel will be controlled by a concrete tower, 125 ft. high, built about 300 ft. above the dam. This tower will permit the reservoir to be lowered 90 ft. during a normal season's operation and will have a clear section at all times through the use of racks placed on one side and extending to the top. In the base of the tower two Morgan Smith disk-arm-type valves can be used to shut off the water.

At the lower end of the power tunnel a 10-ft. side connection leads to a Johnson differential surge tank made by the Riter-Conley Company. This tank is made of steel plate and is 34 ft. in diameter and 184 ft. high. Just below the side connection to the surge tank is a

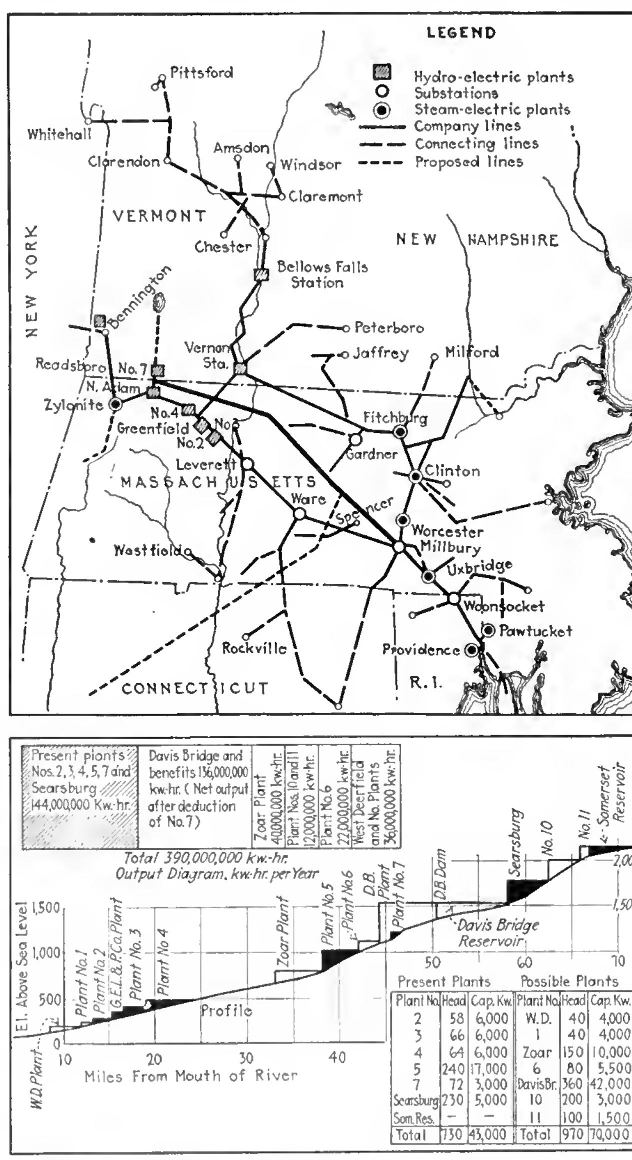

FIG. 1—DRAINAGE AREA OF ONLY 550 SQUARE MILES TO YIELD 110,000 KW.

*Hydraulic engineer. †Assistant electrical engineer.

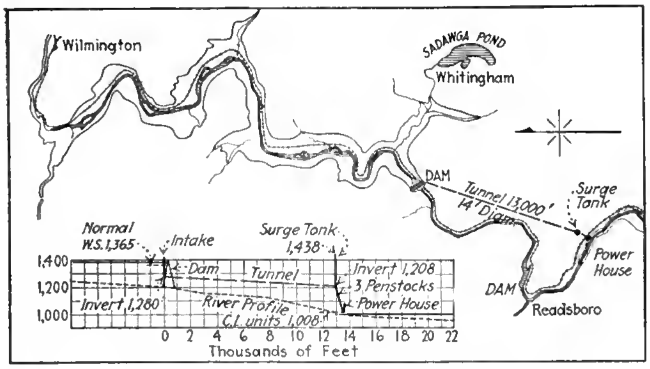

FIG. 2—POWER TUNNEL HALF AS LONG AS RIVER BETWEEN DAM AND PLANT

manifold with three branches leading through Coffin 8-ft. disk-arm valves to the 9-ft. penstocks furnished by the Lancaster Iron Works. The penstocks conduct the water to the power house, which is about 60 ft. by 110 ft. in plan and has a concrete substructure and a brick-steel superstructure. The turbines will operate with a maximum head of 390 ft., a minimum head of 300 ft. and a mean head of 350 ft.

### Station Electrical Arrangements

The initial electrical installation will consist of two General Electric 16,000-kva., 6,600-volt, three-phase, 60-cycle, 360 r.p.m. vertical waterwheel-driven generators, completed, with 90-kw., 250-volt directly connected exciters. The waterwheels are rated at 20,000 hp. and, together with the inlet valves, were furnished by Allis-Chalmers. Provision is made for the installation of a third unit in the future.

On the main floor of the station are the 16,000-kva. generators, each supported by a concrete pedestal which raises the generator about 5 ft. above the floor. Each generator is inclosed in a sheet-iron envelope which forms a housing, so that the hot air from the machines is discharged outside of the building. There are several doors in the envelopes, which make it possible to use this air for heating the building if desired.

### Unit Plant Design

Energy is taken from the generators by means of three 700,000-circ.mil single-conductor cables per leg to the main bus structure, where by suitable oil switches it is fed to the bus or to the power transformers. The station is laid out on the unit basis; one exciter, generator and transformer making up a unit. It is intended that only one machine at a time shall be connected to the main bus, and this bus is primarily used for carrying the station auxiliary transformers and local feeders. It is, however, of sufficient size to allow any generator to be used with any transformer. The auxiliary bus is connected to the main bus through a 1,500-kva., 3 per cent reactor (Fig. 3), thus allowing the use of small switches for station and local feeders. The main bus is separated by barriers, and the whole, together with the three-phase reactor, is inclosed between concrete barrier walls with all blade switches so arranged that they may be operated without entering the bus chamber. Complete duplicate station service transformers and switching equipment are provided, separated by a barrier wall. The auxiliary 6,600-volt bus and local 2,300-volt bus are run in fiber duct embedded in the barrier wall and exposed only at points where connections are made to them. They consist of No. 4/0 solid 13,200-volt varnished-cambric conductor.

The outgoing conductors from the transformer oil switches to the transformers consist of three three-phase, 700,000-circ.mil, 7,500-volt, varnished-cambric, lead-covered cables per transformer, one leg of each phase being carried in each cable in order to eliminate sheath current.

The oil switches are all cell-mounted, the back wall of the cells being carried up to the under side of the switchboard gallery, and the switches located on the side of this wall away from the station, thus eliminating any possibility of switch trouble endangering the generators. The operating solenoids and control relays for the switches are mounted on the mezzanine floor and on the side of the above wall, adjacent to the generators, where they are readily accessible for inspection and free of danger from switch trouble.

### Auxiliary Panels Carry Terminal Blocks

The switchboard is of the vertical type, and for each panel there is provided an auxiliary panel mounted in back of the main panel and 6 ft. from it. All control and meter wires are first brought to the auxiliary panels, where, after passing through terminal blocks, they go to the indicating meters on the main panels and then to the watt-hour meters and relays, which are installed on the auxiliary panels.

On the main floor by each generator is a panel on which are mounted the solenoid-operated field switches and signal boxes. By means of these the governor man receives orders from the operator for starting and stopping the machines. There are also mounted on these panel push-button stations for signaling the operator and for emergency stopping. The generator fields are provided with amortisseur windings, and the generator panels are so wired that phasing may be done in the regular way, or the operator may, by closing a control switch, cause the generators automatically to phase in. This is accomplished by means of speed switches on the generator, which close when the generator has attained 95 per cent of synchronous speed.

The 6,600-volt energy from the generators will be

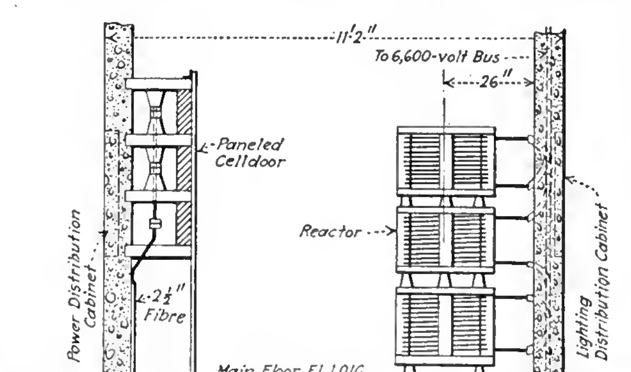

FIG. 3—REACTOR CONNECTIONS ARE MADE THROUGH WALL CONDUITS

stepped up to 110,000 volts by means of two General Electric 16,000-kva. outdoor water-cooled, conservator-type transformers connected delta on the low side and Y on the high. The energy is delivered to outdoor duplicate high-tension buses. Energy from other nearby stations at 66,000 volts will be brought to the Davis

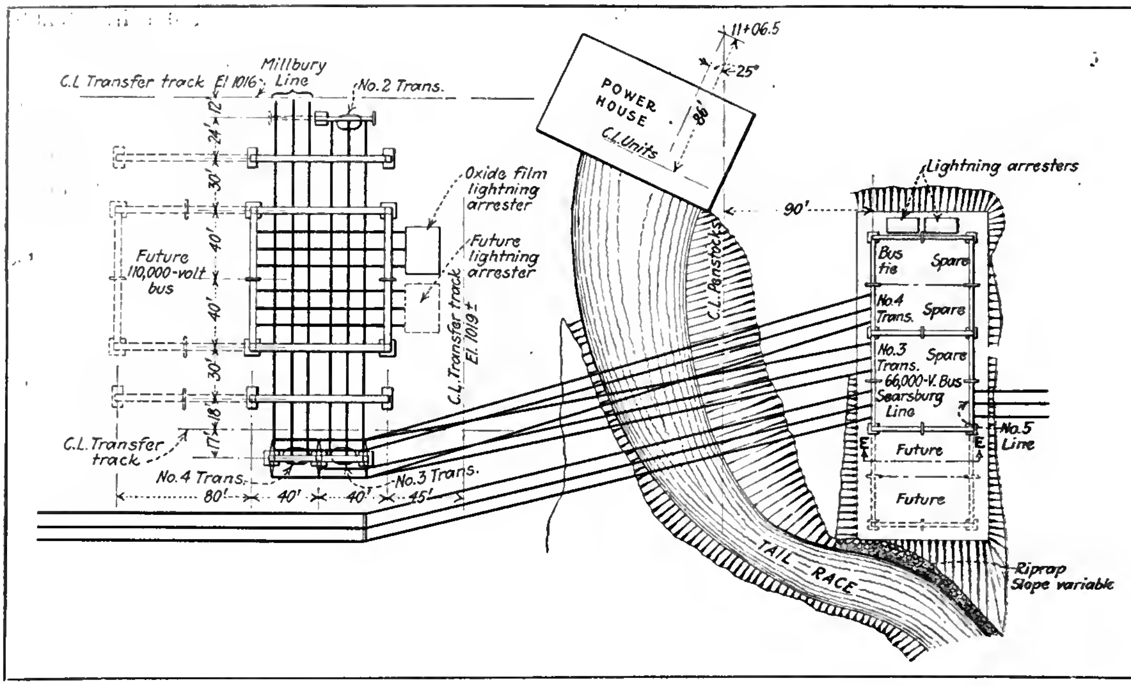

FIG. 4
PROVISION FOR FUTURE DEVELOPMENT HAS BEEN MADE IN 66,000-VOLT STRUCTURAL STEEL BAYS

Bridge station and stepped up to 110,000 volts by means of a 15,000-kva. water-cooled auto-transformer. As a reserve, in case of failure of the auto-transformer, one of the 16,000-kva. units is provided with a full capacity auto-transformer connection on the high-tension winding. On the 66,000-volt and 110,000-volt windings of all transformers taps are provided for voltages 5 per cent and 10 per cent above and 5 per cent below the rated value. Ratio adjusters are installed so that the taps may be changed without entering the transformer tanks.

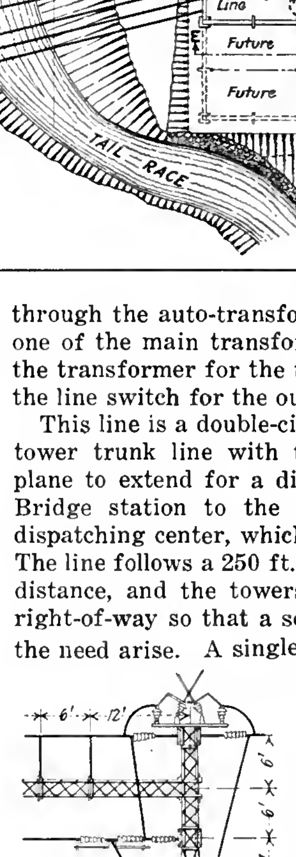
The transformers are mounted on wheels and may be rolled into the station, where pit and crane facilities are provided. In addition a 7,500-gal. oil-storage tank, with filter and piping system, is provided, together with a compressor for forcing the oil through the system to the filter press pump.

### Two-Voltage Switching Facilities

There will be two complete outdoor double-bus, galvanized-steel switching stations (Fig. 4), one for 66,000 volts (Fig. 5) and one for 110,000 volts (Fig. 6), separated by the tailrace, as may be seen by the accompanying plan view. Both stations will be equipped with oxide-film lightning arresters, one being connected to each of the buses rather than one for each line, and suspension-type choke coils will be installed in all high-tension leads to the transformers. The main buses in the 110,000-volt yard are medium-hard-drawn 400,000-circ.mil copper, and the taps are No. 4/0, while the main 66,000-volt buses are No. 4/0 medium-hard-drawn and all taps No. 2/0. The present 110,000-volt structure consists of two bays arranged for two circuits per bay, with provision for four additional bays. The 66,000-volt bus structure consists of four bays arranged for two circuits per bay, with provision for two additional bays.

All transformer and line oil switches are provided with bus selector switches and also shunt air-break switches, so that any oil switch may be taken out of service at any time for inspection and adjustment without disturbing the circuit. The 66,000-volt yard is connected to the 110,000-volt yard by two No. 2 tie circuits through the auto-transformer or the auto-connection on one of the main transformers. At present the bay for the transformer for the third generator will be used for the line switch for the outgoing 110,000-volt line.

This line is a double-circuit No. 4/0 110,000-volt steel-tower trunk line with the conductors in a horizontal plane to extend for a distance of 77 miles from Davis Bridge station to the Millbury substation and load-dispatching center, which is 7 miles south of Worcester. The line follows a 250 ft. private right-of-way the entire distance, and the towers are built on one side of the right-of-way so that a second line may run later should the need arise. A single circuit is being put in at present, but the second will probably be run when the third unit is installed. In order to facilitate the outdoor switching, telephone booths will be installed in both the 66,000-volt yard and the 110,000-volt yard.



No.5 Line
Section E-E

A private telephone line on wooden poles follows the right-of-way, giving direct communication between the station and the dispatcher at Millbury. This means of communication will be supplemented by a carrier-current

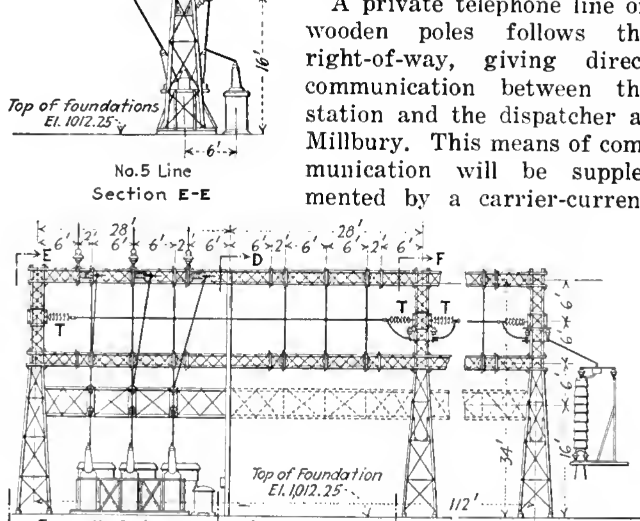


FIG. 5—SYMMETRICAL DESIGN FACILITATES OPERATION OF 66,000-VOLT EQUIPMENT

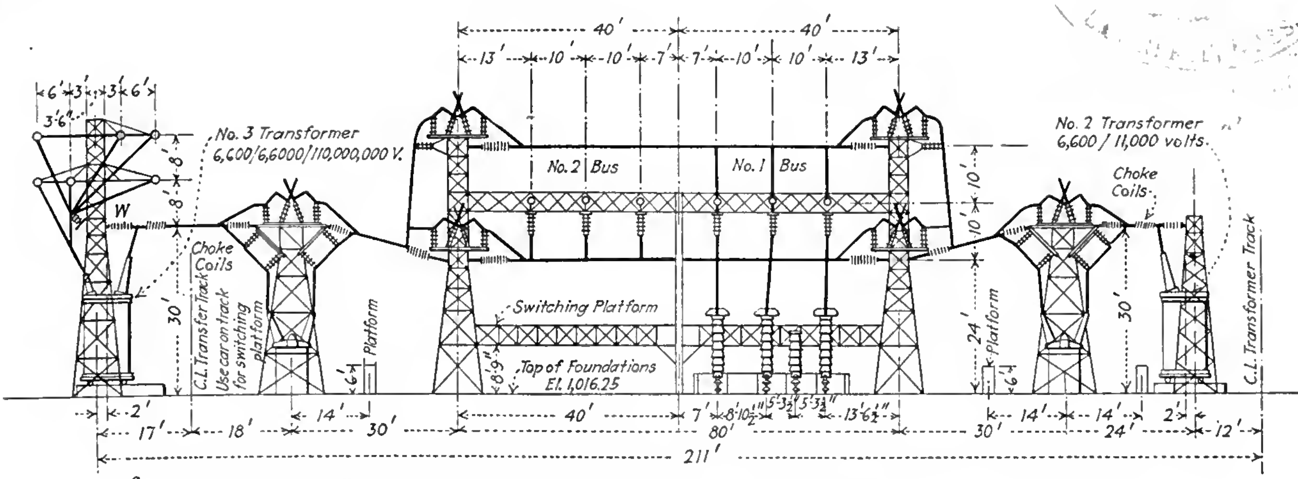

FIG. 6—THOROUGH MECHANICAL DESIGN, COMBINED WITH CLOSE ATTENTION TO INSULATION PROBLEMS, YIELDS ATTRACTIVE 110,000-VOLT EQUIPMENT LAYOUT

telephone outfit similar to that which is already in use elsewhere on the system.

The New England Power Company, through its engineering and construction department, the Power Construction Company, is handling this work. The by-pass tunnel contract was let to the Rollin Construction Corporation, the dam to the W. F. Carey Company, the power tunnel to the Mason & Hanger Company, and the power-house substructure to the L. H. Shattuck Company. With its own forces the Power Construction Company is clearing the reservoir basin, relocating highways, building 8 miles of relocated railroad, building the 77 miles of new 110,000-volt transmission line and handling many other items of lesser magnitude.

## Attendance at Technical Schools in1923 More than 70,000

THE following table, compiled by Walton C. John of the United States Bureau of Education, presents an interesting epitome of the attendance at technical colleges and schools this year, with the total figures for 1922 included for comparison:

ATTENDANCE IN ENGINEERING AND MINING SCHOOLS IN THE UNITED STATES

| Courses | Freshmen and Sophomores | Juniors | Seniors | Total | Specials | Candidates for Advanced Degrees |
|---|---|---|---|---|---|---|
| Civil engineering | *11,204 | 2,433 | 2,018 | 12,167 | 492 | 313 |
| Mechanical engineering | *6,027 | 2,637 | 2,481 | 13,682 | 160 | 95 |
| Electrical engineering | *7,661 | 2,658 | 2,360 | 13,630 | 77 | 123 |
| Chemical engineering | 2,427 | 1,082 | 1,097 | 4,606 | 23 | 111 |
| Mining engineering | 752 | 438 | 536 | 1,726 | 85 | 49 |
| Architectural engineering | 768 | 172 | 165 | 1,115 | 20 | 2 |
| Textile engineering | 227 | 97 | 93 | 417 | 41 | 1 |
| Industrial engineering | 225 | 165 | 69 | 459 | 1 | 1 |
| Aeronautical engineering | 21 | 21 | 23 | 65 | 1 | 18 |
| Sanitary engineering | 16 | 9 | 10 | 35 | 1 | 14 |
| Geological engineering | 13 | 25 | 59 | 97 | 2 | 10 |

| Total in 1922 | 32,178 | 11,446 | 8,520 | 52,144 | .... | .... |

*The figures show the enrollment, based upon the undifferentiated courses of the freshman-sophomore years.

# Some Effects of Current in Metallurgical Operations

### Superior Physical Properties of Alloys Produced in Electric Furnaces May Be Due to Electrical Field Effect on Molecular Structures

BY B. D. SAKLATWALLA
General Superintendent Vanadium Corporation of America

IN THE course of a discussion of electric furnaces at the last spring meeting of the American Institute of Electrical Engineers the author made the suggestion that other effects of the electric current besides the thermal one should be taken into consideration in electric furnace work. The effect of the current on the molecular structure of the molten metal was hinted at. As this idea seems to have found accord it appears opportune to discuss such effects a little more fully.

It has been a generally accepted metallurgical fact that alloys, ferrous or non-ferrous, produced in the electric furnace possess physical properties superior to those of the same alloys produced in combustion furnaces. This superiority has been ascribed to the apparently higher temperature and absence of combustion gases in the electric furnace. The possibility of refinement through the electrical or magnetic effect produced by the current on the material in the molten state has been totally overlooked. Such effect, however, is undoubtedly present. The passage of heavy currents through a molten mass between the arcs is surely accompanied by electrical and magnetic phenomena in that mass producing mechanical effects. Besides, at the points where the arcs are at play there will be some violent stirring and probably a disintegration of the bath material accelerating ebullition and volatilization. In the induction furnace this disintegrating effect might be absent, but the stirring or swirl effect might be more pronounced. These apparent effects have been noticeable to every furnace operator.

There are, however, other effects which may not be externally apparent and may partake more or less of a molecular nature. The metallurgical art aims at elimination of undesirable constituents from a bath of molten metal by chemically slagging off such constituents and thus separating them from the metal. This separation, after completion of the chemical reactions, in the combustion furnaces is dependent only on the difference

in specific gravity of the constituents. In the electric furnace it is possible that the different molecules of the molten bath, finding themselves in an electric or magnetic field, follow a separation dependent on the difference of their electric characteristics, such as conductivity, permeability, etc. Further, the electric alternating tension present may cause a molecular vibration, thus aiding gravitational separation of the metallic and non-metallic constituents, either solid or gaseous. This idea of alternating vibrations leads to the question of frequency and its effect in setting up such molecular motion. As commercial experience in electric furnaces has been in the ranges of low frequencies of 25 cycles or 60 cycles, knowledge as to its effect is virtually absent. The high-frequency induction furnace of the Northrup type, developed on a comparatively small scale, has nevertheless shown excellent results as to quality of product. During the process of melting down or refining in such a furnace the high frequency may contribute to the quick disintegration of the cohesion bonds between the molecules, thus accelerating their liquefaction, or the molecular vibrations set up may facilitate separation of impurities, enhancing the quality of the product. With the advent of the electron vacuum tubes and the comparatively easy method of producing high-frequency currents by their aid, study of this effect and the commercial application of its results appear near at hand.

The molecular electrical effects which help to refine molten metals in the furnace can also be usefully applied to refine the structure of metals during the period of their solidification in a mold. The physical properties of the metal are dependent to a very large extent on the structure of the solidified ingot, on the size of the crystal aggregates and their arrangement and relation to each other. Solidification under ordinary circumstances takes place, depending on the size and shape of the mold, at a more or less uncontrolled rate and in a manner not influenced in any way by the will of the operator. A study of cooling of a metal ingot under electrical conditions produced around or in the ingot might lead to means of controlling the crystallization of the ingot and the physical properties of the finished metal. Crystal growth or solidification in an ingot is the tendency of the atoms to form stronger cohesion bonds among themselves and to ordinate along definite geometrical directions. The assumption that such cohesion bonds are of an electromagnetic nature seems to be gaining ground. If this is true and the solidification process takes place in an electrical or magnetic field, it will undoubtedly be influenced by this field, depending on its intensity. As it would be an easy matter to regulate the electrical or magnetic characteristics of the field at will, it can readily be seen that by this means the process of solidification or crystallization of a metal ingot can be controlled. Not only this change in crystal growth rate can be brought about, but also mechanical effects, such as a molecular stirring or vibration, can be set up which may eliminate excessive primary crystal growth, or gas blowholes, or non-metallic inclusions. For the elimination of these defects, at present, chemical means are employed, such as additions of alloying elements, which tend to refine structure, or scavenging agents, which tend to remove gases and solid non-metallics.

The methods of creating electrical or magnetic conditions in the solidifying ingot can be several and varied. An induced field can be produced by means of extraneous coils, or a direct electrolyzing current can be sent through the body of the metal, or an alternating current can be used in the same manner, this current being of low or high frequency. Undoubtedly each of these means will produce a different result.

Investigations along these lines will probably reveal results of a very striking character and may very radically alter some aspects of alloy metallurgy. Moreover, such investigations afford another substantiation of the utility of electrical energy in achieving remarkably useful results by comparatively simple means.

## Letters from Our Readers

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

### "Did It Happen on the Wire?"

*To the Editors of the* ELECTRICAL WORLD:

The writer enjoyed reading in your issue of May 26 the letter by Walter C. Hecker relative to careless business methods of the central-station interests. A person familiar with the lax methods and the lack of system prevailing in the average business organizations, except the extra-large corporations and the national banks, would not be at all surprised at Mr. Hecker's complaint even though his method of making it might cause an inward chuckle at the expense of the central station.

The exigencies of the time have replaced days and weeks by minutes, and the ever-handy telephone is turning many a black hair gray. Not so long ago we would not think of attempting installations of even minor importance until all details were shown over somebody's signature, but the mad scramble for orders now in vogue has brought in the telephone and the unstable human brain to supersede the written record.

I venture to say that the gist of the motor transaction mentioned by Mr. Hecker consisted of a few telephone inquiries by his customer or his salesman from some overworked employee of the contracting department of the central station. This employee, probably attending to several customers at the same time, simply collected his thoughts as best he could and answered "Three-phase," when, as a matter of fact, the entire situation should have been checked by one of the commercial engineers before any attempt was made to answer the question. I know from experience that such transactions occur hourly, and if the people demanding this immediate telephone service only knew what a proper answer really meant to them, they would prefer to get their rulings in writing. They should wait their turn in line and not expect to be treated on a preferential basis by telephone.

The telephone is one of our greatest conveniences, but when used to transact business that requires time and investigation to reach a proper decision it becomes an instrument of imposture. The writer has made it a rule never to give official rulings over the telephone, and when the case demands careful study never to give important information orally.

The telephone query is assumed to be a part of the procedure that Mr. Hecker leaves between the lines.

GEORGE WELMAN,
Chief Electrical Inspector.
Louisiana Fire Protection Bureau, New Orleans, La.

## Interstation Communication Developments

**Wire, Space and Carrier-Current Systems Analyzed—Combination of Space and Carrier-Current Methods Ideal System—Advantages and Disadvantages of Each**

EXTENSIVE progress in the development and perfection of radio-communication methods and equipment applicable to power company needs is anticipated in the report of the sub-committee on communications of the Pacific Coast Electrical Association to be presented June 19 to 22. Many power companies are, besides, carrying on their own research investigations and meeting with considerable success. Some of the general conclusions of the report are given below.

Wired communication for ordinary routine and load-dispatching communication requirements is, the committee says, usually to be preferred to radio, mainly on account of its present high degree of perfected simplicity. However, it should be supplemented by some means of reliable auxiliary communication, such as "space" radio or "carrier-current" radio, in order to be of the maximum value to power companies in cases where almost uninterrupted communication is a requisite.

Space radio functions very satisfactorily in such instances under many conditions, the report goes on, and where the distances to be spanned do not greatly exceed 100 miles of average topographical features and the stations are not near a large commercial or government station, reliable communication service can be effected at practically all times, without prohibitive installation costs. Before making space radio communication installations in a mountainous country, careful preliminary tests should be made to determine the approximate size of transmitter that is actually required to guarantee reliable communication under the existing topographic conditions. Careful consideration also should be given to the choice of proper wave lengths to reduce outside interference to a minimum.

The fact that the stations are required to be licensed and operated only by licensed operators is a slight objection in some respects, it is admitted, but this feature usually insures a competent man who can be trained for other duties in addition to those of being a radio operator.

Carrier-current radio makes use of transmission-line conductors as "carriers" for the radio-frequency communication energy, besides effecting a marked saving in transmitter energy consumption during normal operating conditions. This system is not affected by the topographical nature of the intervening country, thus making the carrier-current system particularly desirable for application to transmission lines through mountainous sections, where the efficiency of "space" transmission is usually very severely attenuated.

The "carrier" type installation, however, cannot, the report points out, effect communication properly when all conductors of the "carrier" line are grounded, when all conductors of the "carrier" line are severed, or when "carrier" line-sectionalizing switches are opened, unless such switches are properly bypassed by some type of bypassing antenna or other device.

In the event of two or more transmission circuits being carried along the same tower line or right-of-way and being used as a part of the carrier system, the chances for all conductors being grounded or severed are somewhat remote. In the case of the single-circuit transmission line this condition is apt to occur,

### Summary of Advantages and Disadvantages of Different Types of Communication Systems

#### Wire Communication

ADVANTAGES

1. Simplicity of operation.
2. Permits simple duplex communication.
3. Operation independent of topography.
4. Privacy of communication.
5. No station license required.
6. Calling system available.

DISADVANTAGES

1. Service interruptions from line failures, particularly during severe storms.
2. Service interruptions due to trouble on power line, which the communication line closely parallels, causing intense inductive interference.
3. Repairs of line failures often effected very slowly and with difficulty because of remoteness.

#### "Space" Radio Communication

ADVANTAGES

1. Entirely independent of all interconnecting lines and their possible failures
2. Equipment all located at points of operation and thus always readily accessible for repairs when necessary.
3. Usually affords means of communication with commercial or government radio stations in an emergency.

DISADVANTAGES

1. Transmission efficiency subject to intervening topographical conditions.
2. Somewhat subject to outside interference from other stations in some locations.
3. Subject to severe atmospheric interference in some localities for certain periods of season.
4. Duplex communication expensive and somewhat complicated.
5. Lack of privacy of communication.
6. Station must be licensed and operated by licensed operator.

#### "Carrier-Current" Radio

ADVANTAGES

1. Independent of intervening topographal features.
2. Much less power required to cover a given distance than with "space" radio.
3. Greater freedom from external disturbances, such as static, and interference from other radio stations.
4. Privacy of communication.
5. Station license and licensed operator not required.
6. Call-bell system available, not necessitating operator to be listening in to receive calls.
7. Expensive antenna supports and elaborate ground system not required.
8. Little interference created in outside communication systems.
9. Operator may listen to power-line conditions.

DISADVANTAGES

1. Communication subject to interruption when "carrier" line conductors all become severed or grounded owing to line failure.
2. Necessary to "bypass" line switches, auto-transformers, etc.
3. Necessitates use of large transmitter when applied to a "carrier" system composed of a large network of lines or to a transmission line with a very large number of tap feeders or substations.
4. Duplex communication rather complicated and expensive at the present time when applied to telephony.
5. Somewhat more subject to interference from transmission line disturbances, such as discharging insulators arcing grounds, etc., than "space" radio.

but the possibilities for continuous operation are much in favor of the carrier system, even in this case, as compared with the wire-communication line, when it is remembered that a short circuit, ground or break of either of the two conductors of the wire line will cause an interruption to communication service.

A number of data have been reported in the past relative to the ability of the carrier-current radio system to effect communication through open line switches, past severe breaks in the line and through solidly grounded lines. It is the conservative opinion of the committee that such cases are misleading, since it is believed that if they are carefully analyzed it will be found in each case that communication was really effected by space transmission, if the distance between the two stations was comparatively short, or else there has been a means of bypassing the carrier radio energy past the fault that was not realized at the time of the incident.

### Bypassed Transmission Line

For example, there may be a twin-circuit and single-circuit transmission line connecting two points of operation separated a hundred miles or more. If line-sectionalizing switches opening both circuits of the twin lines are operated and tests made, the impression might be gained that the carrier system was jumping the switch, whereas in reality it is being routed over the single-circuit line. Similar reasoning will apply in the case of solid grounds on all conductors of the twin-circuit line, or even in the extreme case of all conductors of the twin line being severed and grounded. Moreover, a near-by communication or low-tension power line may possibly serve as a bypass if it parallels the carrier line at the point of open switches or severed conductors.

Actual tests have been made by some power companies which prove that the antenna of the carrier system is a fairly efficient space radiator, even when being used as a carrier antenna and placed very near the transmission-line conductors. This fact may have been overlooked during certain carrier tests with open-line switches, grounds, etc., and reported reception through such faults may have been accomplished in reality by space transmission.

Carrier-current radio functions well, the report goes on to say, but its efficiency should not be overestimated, and its advantages and disadvantages should be relatively weighed and compared with those of the other means of communication.

The ideal auxiliary communication system in most cases would, it is concluded, be a combination of the space and carrier current systems. The logical use of such a combined installation would be to utilize the carrier system at all possible times (for reasons apparent from reviewing the advantages under carrier-current radio in the accompanying summary); then, in the event of failure of the carrier system due to severe transmission line trouble, it is possible to throw over to the space radio antenna, increase power output of transmitter, retune the transmitter if necessary and continue operations.

Naturally, the size of the transmitter in this case must be several times what it would be for straight carrier service, particularly in mountainous sections. In some cases intermediate stations could be utilized to relay the communication through if necessary, thereby permitting the size of the transmitters to be smaller than they would otherwise necessarily have to be to guarantee dependable space transmission over comparatively long distances.

The principal disadvantage of this combined system would be that under the present regulations of the Department of Commerce stations of this character utilizing a space antenna would be subject to the rules and regulations applying to a limited commercial radio system. This, the committee says, would necessitate the station being licensed and operated by a licensed operator.

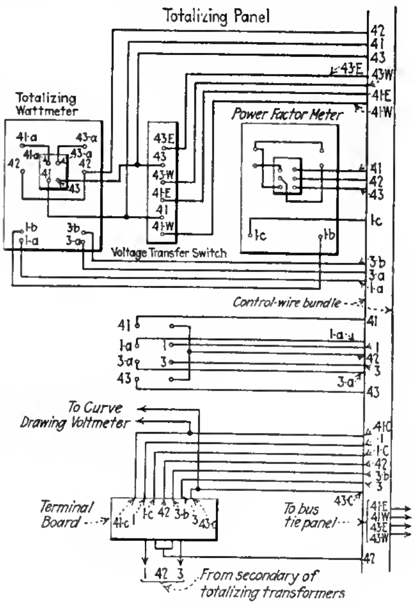
FIELD EDITOR ELECTRICAL WORLD.
San Francisco, Cal.

## Identifying Control Wires

IN TRACING control wiring to check an actual installation against the wiring diagram it is usually difficult to follow any specific circuit amid a maze of other wiring. This may delay installation work or changes when time is an important factor. Furthermore, some error may be made which may be difficult to discover.

To avoid these objections the Alabama Power Company has adopted a very simple numbering and tagging system for all control wiring. All secondary leads from current and potential transformers are brought into a terminal board mounted at the base of each panel several inches back of it. On this terminal board are short single-pole knife-blade switches without any handles but having lugs which facilitate their being operated and closed when tests must be conducted. From this board the control wiring to instruments on the panel as well as the wiring between instruments is run in a bundle up the middle of the panel but at several inches from it, with laterals running off where necessary.

To each wire from an instrument transformer is given an identifying number which is the same on all panels. After it runs through an instrument a letter is appended to the number, starting with *a* and changing to the next letter in the alphabet each time the circuit passes through an instrument.



IDENTIFICATION PLAN FOR LEADS

Tag system combined with successive lettering of leads as they pass through instruments an advantageous method.

For example, consider circuit No. 1 at the bottom of the accompanying illustration. It runs to the cable bundle and emerges a slight distance above, goes through the totalizing watt-hour meter and emerges as No. 1a. It again enters the cable bundle and emerges again above, going to the totalizing wattmeter, from which it comes out as No. 1b and goes to the bus power-factor meter. From this it emerges as No. 1c and enters the cable bundle. At the bottom it comes out again and returns to the test block as No. 1c.

At each terminal a round fiber tag (½ in. in diameter) is attached bearing the identifying number stenciled in its surface. The tags are very durable and not easily defaced.

New York, N. Y.

## Analyzing Interruption to Hydro-Electric Service*

ANALYZING interruptions to service calls for a standard of measurement that should be quantitative primarily and qualitative only when there is no way to express quality except by comparison with the general service experience familiar from steam practice. Quantitative measurements refer to the duration of a disturbance in minutes and seconds, to the amount of load lost, and to the extent of fluctuations of voltage and frequency at times when no load is visibly lost, but when, nevertheless, service is not perfect.

The standards that are referred to in the classification of disturbances (Table 1) are those developed during the past ten years of combined hydro-steam operation in the Baltimore-Lancaster load centers, where the Pennsylvania Water & Power Company furnishes the hydro-electric power from a development on the Susquehanna River at Holtwood, Pa. Naturally these records will refer only to the few minutes and seconds and fractions thereof when service was not 100 per cent perfect, regardless of whether trouble originated on the hydro-electric system proper, or at the steam plants operated in parallel, or on the general distribution system.

Public utilities intrusted with the supply of power to the large cities assume as a matter of course that power must be continuous and first class in every respect all the time and that a strict accounting must be given for every second when, for any reason, the 100 per cent standard is not maintained. Such an analysis will inevitably include a study of the original cause of each disturbance, of the various secondary events, the functioning of relays and other automatic devices, the manipulations carried out by attendants in response to the indications of switchboard instruments, and, lastly, a study of the ultimate effect of each disturbance on service. The natural consequence will be that all possible corrections of conditions responsible either for the original cause or for subsequent undesired secondary effects will be carried out, and that improved operating methods will be adopted that will reduce or eliminate the chances of such causes recurring.

Under the standard adopted for the Holtwood-Baltimore-Lancaster system a total loss of load, be it for only a second, is classified as a total interruption; a partial loss of load, provided that it can be traced on the main station instruments, is classified as a partial interruption, and

| Moderate load lost due to intentional reduction, by orders or by switching | | | | | | | | | | | | 1 |
| Moderate load lost on feeder in trouble | | | 2 | 1 | | 2 | | | | | | 5 |
| Moderate load lost due to low-voltage releases tripping | | | | | | | 1 | | | | | 1 |
| Moderate load lost due to additional primary relay action | | | 2 | 2 | | | | | | | | 4 |
| Moderate load lost due to separation and out-of-step condition | | | | 1 | | 1 | | | | | | 2 |
| Large load lost due to intentional reduction, by orders or by switching | | | | | | | | | | | | 0 |
| Large load lost on feeder in trouble | | | | 1 | | | | | | | | 1 |
| Large load lost due to low-voltage releases tripping | | | 1 | | | | | | | | | 1 |
| Large load lost due to additional primary relay action | | | | | | | | | | | | 0 |
| Large load lost due to separation and out-of-step condition | | | | | | | | | | | | 0 |
| Total interruption of less than five minutes | | | | | | | | | | | | 0 |
| Total interruption of five minutes or more | | | | | | | | | | | | 0 |
| Total | 0 | 4 | 75 | 57 | 0 | 20 | 12 | 1 | 7 | 3 | 0 | 179 |

*Wind, flood, men, heat, cold, moisture, tools, trees, birds, other animals, kite strings, etc.

*Excerpt from address before a joint meeting of the A. I. E. E., A. S. M. E., A. S. C. E. and A. I. M. E. at New York, March 21, 1923.

irregularities in voltage or frequency exceeding 4 per cent in voltage and 2 per cent in frequency are classified as disturbances, although no visible loss of load can be traced on the graphic wattmeters.

The statistics (Table I) illustrate more convincingly than can be done by general statements that hydro-electric plant troubles as such—i.e., causes numbered 1 to 5 on the tabulation—ceased to be the cause of interruption after a few years, although they were responsible for a few serious disturbances during the early period of operation at Holtwood. For example, ice caused a complete shutdown in 1912, about one year after commencing operation. Up to that time the general belief was that a plant built almost at the Mason-Dixon line with a storage lake 9 miles long would be immune from frazil ice. The tabulation shows only one other instance of trouble from this cause (in 1914), and in this case frazil ice was combined with ordinary ice. Only a partial reduction in service resulted. All the other sources of trouble at the hydraulic plant (causes 2 to 5) show a similar tendency to disappear.

Lightning in the first year of operation, 1911, caused twenty-three total interruptions of a few seconds or a minute each, none of them causing any permanent disabling of the line. Chiefly because of the use of the Nicholson are extinguisher, this number was reduced in the following year, 1912, to three; in the next five-year period these interruptions were reduced to an average of 1.4, and in the last five years to an average of 0.8. There have been no interruptions during the past three years.

Distribution trouble, chiefly that originating on the city distribution system and at the interconnected steam plants, shows a trend in the opposite direction, at least as regards partial interruptions. The number of partial interruptions from this cause rose to 238 in the past five years from a total of 134 during the preceding five-year period. Minor disturbances to voltage and frequency have increased to 273 from 74. This condition has caused the operating engineers to concentrate their studies in more recent years on the distribution problem as the principal field for possible service improvements. This study has been aided by means of a detailed tabulation (Table II) where disturbances are classified as to cause and effect on service.

## Commutator and Brush Operation

Brushes should be so fitted to the commutator that the entire brush surface is effective, thereby reducing heating of the brushes or any tendency to spark caused by improper contact. The spring tension on the brush should be sufficient to prevent chattering and to make proper contact with the commutator, but not sufficient to cause undue friction between the brushes and commutator. Care must be exercised not to apply too large a quantity of lubricants, as this, while it may reduce friction, will cause poor contact.

The commutator of the machines should be wiped off frequently to remove the dirt, which in a short time would cut the commutator surface. As occasion demands, especially when sparking is caused by a very dirty commutator, the commutator may be cleaned by using very fine sandpaper and then wiped clean with a rag.

With slip rings the same precautions must be taken as with commutators to prevent cutting of the surfaces by the brushes and also to insure good contact between the surface and the brushes.

The following rules applying to commutators, brushes and slip rings have been abstracted from the operating code of the Philadelphia Electric Company:

### Commutator and Brushes

1. If machines are installed in dusty, dirty or poorly ventilated places, the commutator should be wiped every half hour. When machines are in more favorable places, this time may be extended to two or even three hours.

2. Lubricant consisting of commutator oil is to be used once every half hour to every two hours on commutators having copper brushes. In no other case is a lubricant of any kind to be used. However, if the commutator shows a tendency to cut, this may be stopped by cleaning once every half hour or hour with paraffine. Paraffine should not be allowed to remain, but should be wiped from the commutator immediately after it has been applied. Both paraffine and lubricant should be used sparingly. For cleaning the commutator or applying lubricant a standard commutator stick should be used. No lubricant is to be used on slotted commutators under any circumstances.

3. On machines equipped with brush-shifting mechanism adjust the brush position to give minimum sparking.

4. Brushes which have stuck in the holders may be loosened, or dirt may be removed, but in making these adjustments while the machine is running the brush must never be entirely removed from the holder.

### Slip Rings

1. Do not use lubricants or wipe the rings where they are made of brass or steel and the brushes are either carbon or a graphite-copper alloy.

2. Where oil from adjacent bearings is thrown on slip rings, they should be wiped once every one hour or two hours with a standard wiping stick.

3. If there is a tendency to cut, a slightly oiled instead of a dry cloth may be used on the stick for wiping.

4. If the rings are brass and the brushes leaf copper, commutator oil or vaseline should be used for lubricating once every hour.

## Boring Boiler Tubes

When boring boiler tubes care must be taken not to allow the boring machine to remain at any one place, as it will cut the metal and weaken the tube. First of all, the boiler should be taken off the line, following the rules published on page 811 of the April 7 issue of the Electrical World. The rules given below for boring tubes, taken from the operating code of the Philadelphia Electric Company, should then be followed:

1. When the scale can be removed with the cone cutter, the hammer must not be used.

2. See that the mud drum is open, and remove at least one cap from the back header.

3. Block the blow-off pipes at the mud drum to prevent scale from going into the blow-off piping.

4. Insert the machine in the end of the tube before starting.

5. Signal the helper operating the air valve to turn on the air.

6. After the machine has started, feed it slowly into the tube and do not allow it to remain stationary at any point.

7. After the machine has entered about one foot, water should be fed into the tube behind the machine.

8. If hard scale is encountered, preventing the machine from being fed through at uniform speed, the machine should be drawn backward and fed forward again until the obstruction is removed; the machine must not be allowed to remain cutting at one spot.

9. Repeat the operation until the tube is bored to gage.

10. Oil the boring machine after boring every four tubes.

11. After all the tubes have been bored to gage, wash out the tubes with water.

12. Remove the scale from the mud drum.

## Cost of Installing Street-Lighting Equipment

DURING 1922 a Massachusetts central-station company added 223 series brackets, eighty-four ornamental posts, twenty-nine mast arms and incidentals to its street-

STREET-LIGHTING EQUIPMENT COSTS FOR 1922

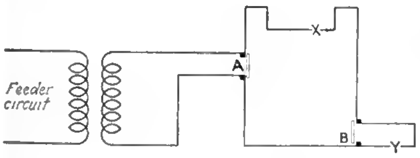
| Items | No. of Units | Price per Unit | Totals |
|---|---|---|---|
| Series brackets | 223 | $9.807 | $2,187 |
| Series brackets less hoods | 139 | 1.977 | 275 |
| Span suspensions | 4 | 14.092 | 56 |
| "Jupiter" cut-outs | 27 | 14.020 | 378 |
| "Novalux" fixtures | 69 | 12.530 | 865 |
| "Bishop" fixtures | 144 | 14.538 | 2,093 |
| Cut-outs | 13 | 10.108 | 131 |
| "J134Y" cut-outs | 32 | 12.588 | 403 |
| "Bishop" crook brackets | 21 | 4.105 | 86 |
| "Form 10" fixtures | 20 | 10.864 | 217 |
| Ornamental posts | 84 | 37.594 | 3,158 |
| Brady mast arms | 29 | 16.781 | 487 |
| Miscellaneous material, bolts, insulators | | | 1,781 |
| Teaming | | | 27 |
| Street-light location cards | | | 23 |
| Making wrenches | | | 5 |
| Miscellaneous small items | | | 5 |
| Transportation by utility company | | | 311 |
| Payroll labor | | | 1,821 |
| Total (cents omitted) | | | $14,309 |

lighting equipment, at a total cost, including transportation and labor, of $14,309. From the work sheets of the company the accompanying tabulation of these costs is printed, with unit prices met by the utility.

FIELD EDITOR ELECTRICAL WORLD.
Boston, Mass.

## Locating Open Circuit on Series Systems

THE problem of quickly locating open circuits on series systems due to broken lamps or trouble on current transformers has always been a bugbear, but the method used on the writer's lines has reduced the time thus lost considerably. Assuming that the lines are laid out as shown in the diagram, fuse blocks



JACK PERMITS LOCATING OPEN CIRCUIT IN SERIES SYSTEMS

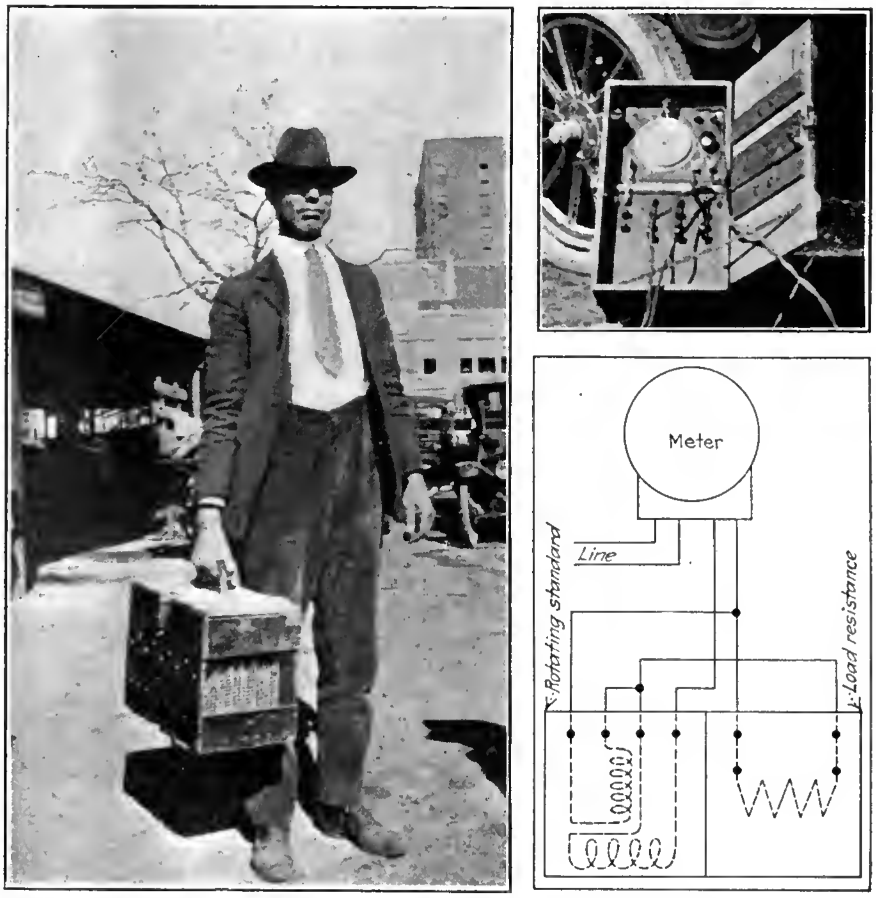
Inserting jack *A* or *B* in the fuse blocks furnishes current for all but one section while the trouble is repaired along the line.

with the jacks left out are connected at places *A* and *B*. The jacks are not fused but are strapped across with a piece of copper wire and are left out unless an open circuit is being hunted. Should there be an open circuit somewhere on the line, say at *X*, the "trouble shooter" can go directly to *A* and insert his jack. If the circuit is closed to his left, all the lamps will be burning and this will indicate that the open circuit is further along the line. He then travels to *B* and repeats the operation. If the lamps do not burn, he knows that his open circuit is behind him; but should there be an open circuit as shown at *Y*, all the lamps to his left will be burning, and this will indicate that the open circuit is on the one remaining section of the line.

This method of completing the circuit prevents an entire district of the town being without lights because there is an open circuit in one small section, since the jack can be left in position, thereby furnishing current to the rest of the system until the open circuit at *Y* has been fixed.

RAYMOND H. FORKNER,
General Manager.
Madisonville Light & Power Company,
Madisonville, Tenn.

## Rotating Standard Combined with Load Resistance



COMBINED TEST SET THAT HAS PROVED VERY SATISFACTORY

Left—Rotating standard and resistance load mounted in box conveniently arranged for carrying.
Upper right—Box opened, showing combined set.
Lower right—Diagram showing how meter is connected to throw the shunt loss on both the standard and the meter under test. This arrangement has worked out very satisfactorily.

BY MOUNTING a rotating standard watt-hour meter and load resistor in a box arranged for convenient carrying meter testers of the San Antonio (Tex.) Public Service Company have averaged as high as forty tests a day. Two views of this box are shown above.

The connections are all permanent so that no time is lost on the job. All that is necessary is to replace the two load wires of the customer's meter with those of the box and then proceed with the test. The wiring diagram shows how the standard is connected so that the shunt loss of the meter is measured on both the standard and the meter under test. The box complete with tools and wiring weighs 35 lb. The box and circuit were developed by Grover Lee of this company and after several months' service have proved satisfactory and a great improvement over the system of separate load and standard.

H. T. POWELL,
Meter Department.
San Antonio Public Service Company,
San Antonio, Tex.

# Central Station Business

Advertising, Selling and Service Methods
Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences

## Appliance Selling in Small Communities

**How One Central-Station Company, Serving Sixty-four Cities and Towns, Has Organized and Operated a Selling Staff and Put the Merchandising Business on Its Feet**

By P. D. Kline
Vice-President Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis.

AT LEFT—SALESROOM IN THE LA CROSSE OFFICE. AT RIGHT—AN OUTDOOR DEMONSTRATION IN BLAIR

CENTRAL-STATION companies that are facing today the problem of organizing and developing the market for electrical appliances among smaller communities may perhaps find something of interest in the recent experience of the Wisconsin-Minnesota Light & Power Company. This company serves sixty-four communities in the region lying to the east of St. Paul and Minneapolis. The principal towns and their population are: LaCrosse, 35,000; Eau Claire, 21,000; Winona, 21,000; Chippewa Falls, 11,000; Red Wing, 9,000; Sparta, 5,000; Rice Lake, 5,000, and Menomonie, 5,000. Headquarters are in Eau Claire, and several stations, both hydro-electric and steam, are interconnected in a loop. We maintain twenty district offices and serve a total population of 125,000.

Two years ago the merchandising of gas and electric appliances in this country was flat. Industries as well as the farmers in the surrounding community experienced bad times and transmitted that depression to all lines of business. We lost money in our merchandising during 1921, and our organization dwindled to almost nothing so far as the appliance sales department was concerned. In 1922 we, like many other organizations, decided that business was to be had if sufficient effort were put forth; therefore, even though it was necessary for us to start from the bottom to build up a sales organization and develop an appliance sales business, we set about doing that thing. Price cutting had been indulged in and war-time appliances got into the hands of the consumers with a good deal of grief and dissatisfaction as a result. We, therefore, realized that we had these conditions to live down and overcome.

At the very outset, therefore, we set about to do two things—to make a complete survey of all of the appliances then in use in the homes of our customers in order to obtain an idea of the field before us, and to test out the different lines of appliances offered by the market, aiming to eliminate unworthy goods and thereby re-establish quality and price level based upon quality merchandise. To accomplish this, we made a careful house-to-house survey of the customers in the principal towns, and by calling meetings of the managers of the various districts and getting their combined opinion upon the quality and practicability of various appliances we soon had a working basis on which to proceed with the building of our merchandising business.

We procured a number of good salesmen, schooled them, and then started to do business. We began to run campaigns, covering first one appliance and then another, supporting each of these campaigns by dealer helps, newspaper advertising, window displays and special price, offering an inducement as the character of the appliance indicated that such inducement would be a sales help. We tried particularly to impress upon our men the importance of calling back on every customer, and while it has been difficult to have this idea carried out in a 100 per cent manner, we are improving continually and the salesmen are realizing more and more the

AT LEFT—ANOTHER VIEW OF THE BLAIR DISPLAY. AT RIGHT—A WINDOW IN SPARTA

value of a satisfied customer. Based upon our survey, which indicated that the present saturation of the more common appliances, such as the washer, cleaner, flatiron, toaster, and so on, was approximately 25 per cent, it was seen that if we could increase this saturation to a 75 per cent point, it would result in an increase of revenue amounting to about $300,000 per year, showing conclusively that we had a goal and that it was worth strenuous effort to reach.

We then worked out a sales bogey, or quota, for each district and advised the district manager of the amount of his bogey, which constituted the net sales that he was expected to realize to keep up his portion of the total amount anticipated as the year's business.

### PLACING THE STAFF

We built up our selling staff until it numbered fourteen men, all established in the larger towns and doing general selling. In addition, we have one expert industrial engineer who helps on big jobs. We figure roughly that from 5,000 to 6,000 population will support one salesman. We group the smaller towns with larger ones to make a territory, because four or five towns of 1,000 inhabitants can be made to produce business no less than one town of 5,000. In the large towns and many of the small ones we have an office. Girls are employed to sell on the floor. All the towns are working along standard lines as to price and policies, and we are impressing on all our people that they must not fear price competition, that our prices are right for our quality and that our quality is right for our customers.

We are trying also the experiment of employing a few middle-aged men and some women for outside selling, believing that they can call at the homes and get a more considerate reception than might be accorded to young men. So far the plan is working out well. These salespeople make fewer calls, but seem to be able to tell their story better and to get results.

We had, of course, worked out a compensation plan for the salesmen, some of whom were paid on the basis of $100 per month and a 10 per cent commission on all sales over $1,200 per month; others were paid on a straight 10 per cent commission covering all sales, while still others were placed on the basis of $100 per month drawing account and 10 per cent on all sales. If any man goes below $1,000 per month for three consecutive months, we feel that he is not doing a satisfactory business, and he is replaced. In addition to the commission on sales, a bonus was paid for all new services, either gas or electric, procured by the salesmen, and a bonus was paid for all appliance "prospects" turned in by any member of the organization if the "prospect" resulted in a sale. This bonus, however, was paid only where the new customer had not been canvassed by a salesman previous to the time that the name was turned into the commercial department.

### SELLING ON TRIAL

We have a large foreign-born population—German in La Crosse, Norwegian around Eau Claire. The easy payment seems to appeal to them, and we have no difficulty in collecting. We demonstrate appliances freely and leave them on trial in many cases. The Norwegians are very heavy coffee drinkers and we anticipated a large sale of percolators, but to our surprise found it almost impossible to interest them. They are accustomed to keeping a pot of coffee boiling on the stove all the time and to drink it strong, and they will not make it the electric way.

AN EAU CLAIRE WINDOW DISPLAY FEATURING LADY KILLERS VERSUS ELECTRICAL EQUIPMENT

AN UNUSUAL CLEANER WINDOW IN EAU CLAIRE

This is just a little sidelight on the way that local influences sometimes affect the appliance market. In our effort to re-establish "quality" merchandise in the cities we serve we have tried in every case, in adopting an appliance, to secure the same price and profit for one or more dealers in the town, and then we have advertised their names along with ours. Salesmen of competitive brands have naturally complained, saying that we have bottled up the towns; but we believe that the public is benefited by the elimination of riffraff appliances and that the dealers are benefited by having an established market and a sure profit.

### WIRING BUSINESS

We have supported the contractors well in wiring also. In some small communities where there is no city inspection and the wiring has not been up to code, and where it has been found impossible to raise the standard of wiring through suggestion in the public interest, the company has gone into the wiring of houses itself. But this has been entirely conditional on the kind of job the local contractors were doing. In larger towns in co-operation with the contractors we have developed a flat-rate wiring schedule based on a price per outlet and are actively selling wiring which the contractors install, paying a commission to our salesmen no matter who wires the house. At the present time we have about 24,500 residence meters in service. Last year approximately 700 houses were wired. We are trying to influence the installation of more convenience outlets and are working with the architects and builders to try to "sell" the idea.

All our salesmen are working continually on both store and window lighting, and we have installed some colored lamps and with good results. The power field is limited, but we are constantly after the blacksmith shops, condensories, creameries, machine shops, garages and so on.

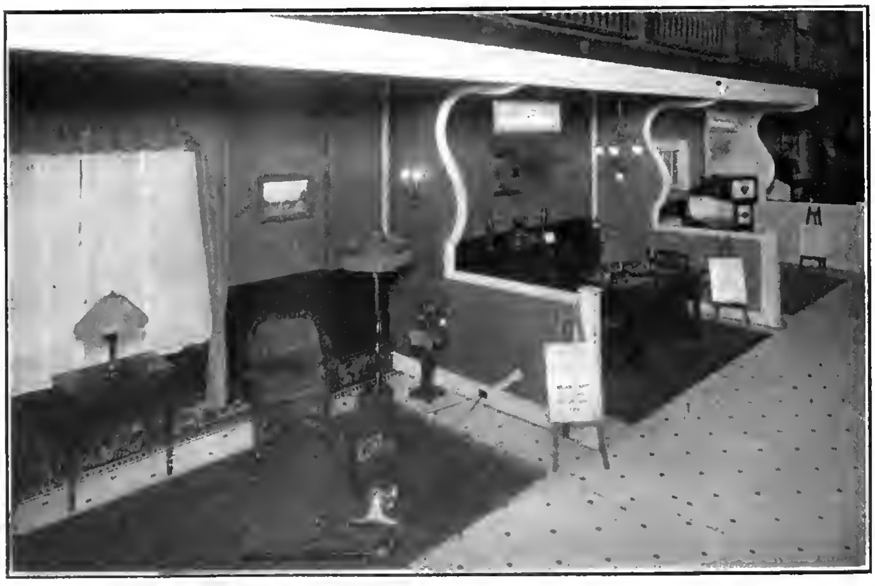
We have done a considerable amount of advertising in local papers and direct by mail and have made a feature of our store-window displays and demonstrations. The purpose in it all, however, has been primarily to sell the idea of the quality of electrical goods and the importance of the central station to the community. Our own organization is thoroughly imbued with this point of view. We tell our customers that if an appliance is broken it should not be put on a shelf but brought to us. We try to keep every appliance in use. We have run a school of home economics in five of our larger towns and have given many lectures and talks before Kiwanis and Rotary clubs and shown a motion-picture film showing our plant and construction. In one of our offices we are setting up a model kitchen and laundry.

In fact, in the small communities we are serving we realize that we have the same fundamental social structure that exists in the big cities. We have families living in houses, and no matter where families live they have the same general desires and needs. Thus we have simply gone to work to try to satisfy those needs and develop those desires through education in so far as the comforts, conveniences and utilities of electric service are concerned.

While it is true that our plan has not materialized to the 100 per cent point, the close of 1922 found the commercial department self-sustaining with a small profit as compared with a deficit in the previous year, and the first four months of 1923 have shown approximately double the volume of the same period a year ago; therefore, we conclude that our efforts have produced some result, that by the experience of the past year we are going to profit materially during this year, and that our consumers are likewise going to profit by maintaining and following out a sales plan which embodies "quality" merchandise and service.

## A Practical Layout of Electrical Home Needs

THE Utah Power & Light Company has adopted this very pleasing and effective way of displaying electrical appliances for the home. The south wall of the company's large electric store in Salt Lake City has been partitioned into three rooms —a living room, a dining room and a kitchen—representing an electrically equipped home. These rooms are not "overdone" with electrical appliances, but each contains equipment appropriate to the use of the modern housewife. The display is attractively arranged and receives the attention of most of the people who enter the company's electric store.



A ROOM OF ELECTRICAL APPLIANCES

## "Business Builder" Helps Employees' Interest

By A. M. Frost
Manager of Sales San Joaquin Light & Power Corporation, Fresno, Cal.

IT IS the intention of the San Joaquin Light & Power Corporation to make every employee of the company a salesman and a reporter of complaints. A blank book, the "Business Builder," has been issued to every member of the operating force, and in circular letters and meetings all have been instructed how to use the books. The line cut shows a sheet out of one of the books, on the cover of which the following instructions are printed:

| Form 2149 | SAN JOAQUIN LIGHT & POWER CORPORATION BUSINESS BUILDER |
|---|---|
| Name | Name ........ District |
| Address | Address |
| Complains of / Interested in | Complains of / Is interested in |
| Date | Date ........ Signed ........ Dept. |

BLANK AND STUB ON WHICH EMPLOYEES REPORT PROSPECTS OR COMPLAINTS

> With this book you can render valuable assistance to the management in improving our service and building our business.
>
> If you hear of a complaint about service, make out a form and scratch out the line "Is interested in."
>
> If you hear of a prospect for additional load or appliance sales, make out a form, scratching out the line "Complains of."
>
> Turn in to manager of your district through your department head.
>
> Fill out the stub for your record. A report will be made to you about each form you turn in.
>
> I thank you for your co-operation.
>
> A. M. Frost, Manager of Sales.

Each district manager is charged with the responsibility of seeing that the employees use these books. In adopting this practice the company is going on the theory that every employee has a great many friends and personal acquaintances who look upon him as a representative of the power company. The use of the book enables employees to report complaints they hear of and to turn in prospects for additional business. It has been found that meter readers, collectors, linemen and office employees are all in a position to use the "Business Builders" to the advantage of the company as well as to their own advancement. The company hopes to be able to recruit salesmen from within the organization, and the use of these forms will give a line on good men by the number of reports turned in and the intelligence with which they are used.

During the short time the system has been in use it has produced satisfactory results. Employees who are not actually engaged in sales work feel that through the use of these books they have been given some part in the devolopment of the company's business and its management. The plan will not only conduce to harmonious public relations but will actually help in increasing the company's earnings.

## Illinois Company's Sales Show Big Gain

THE income to be derived from the sale of appliances by public utility companies and the extent to which this branch of the business can be developed is strikingly illustrated by the accompanying tabulation of the sales of the Central Illinois Public Service Company of Springfield for the first four months of this year as compared with the same months of the year previous.

GAIN IN CENTRAL ILLINOIS COMPANY'S SALES

| | 1922 | 1923 | Increase in Sales | Per Cent Increase |
|---|---|---|---|---|
| Jan. | $18,953.15 | $24,907.92 | $5,954.77 | 31.4 |
| Feb. | 14,260.46 | 32,537.56 | 18,277.10 | 128.1 |
| March | 19,297.46 | 33,242.00 | 13,944.54 | 72.0 |
| April | 20,060.90 | 39,647.77 | 19,586.59 | 97.5 |
| Total | $72,571.97 | $130,335.25 | $57,763.28 | 80 |

While this remarkable increase in sales can be attributed partly to improved business conditions and to the increasing popularity of electrical devices, it is none the less true that the principal contributing factor to the increase has been the intensive effort made to develop this branch of the business.

As indicative of the class of appliances sold during one week, the sales included twenty-one vacuum cleaners, ninety-one irons, nine electric ranges, thirty-six washing machines, four sets of fixtures, four motors and eight fans. These, with other miscellaneous items, represented sales for the week to the value of $12,279.

## What Other Companies Are Doing

**Seattle, Wash.**—The Puget Sound Power & Light Company is issuing an illustrated handbook, primarily for the use and information of employees interested in the sale of company securities. A number of copies are going into the hands of the public and will provide those of an inquiring mind with the facts that will go far toward removing any prejudice they may have against the company.

**Worcester, Mass.**—A motor installation of about 4,000 hp. rating is planned as a means of reducing steam-power costs at the local mills of the American Steel & Wire Company, a subsidiary of the United States Steel Corporation. Power will be supplied by the New England Power Company. Hugo Rocktashel is commercial manager.

**Pine Bluff, Ark.** — On April 24 the Rotary Club of Pine Bluff turned over its luncheon to the Arkansas Light & Power Company. William Crooks, chief engineer, and C. S. Lynch, purchasing agent, presented a graphic story of their organization by the use of an electrical map showing the value of interconnection with their three generating plants. The Arkansas company now has 1,000 stockholders, and the Pine Bluff company has 350, of whom 150 are residents of Pine Bluff.

**Lake Geneva, Wis.**—Seventy-two people composed of executives and employees of the Southern Wisconsin Power Company and local newspaper men were guests at a banquet tendered by the company to its employees on the occasion of their regular monthly meeting for May. Employees gathered here from the various sections served by the company. The principal address was given by W. S. Vivian, public relations superintendent of the Middle West Power Company, Chicago, who spoke on the promotion of better public relations between public utility companies and the public through the medium of the greatest point of direct contact, the employees.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Generation, Control, Switching and Protection

*Mechanical Forces in Knife Switches.*—O. EDELMANN.—For the proper design of a mechanical testing machine for knife switches it became necessary to determine the pressures which occur during the regular closing and opening of such switches. As an average switch a double-pole 200-amp. model has been chosen. More than two-thousand tests were made with twenty-two operators, of various heights, with the switch mounted at five different heights. The results were tabulated and give valuable information for the design of such switches from the purely mechanical standpoint. — *Elektrotechnische Zeitschrift*, March 29, 1923.

## Hydro-Electric Development and Steam Equipment

*Boiler Furnace Design.*—E. B. RICKETTS.—The author considers the factors governing furnace volume and construction of boiler-furnace walls, discussing types of fuel-burning equipment, pulverized-fuel systems, shape of combustion chamber, mixing arrangements, etc. He holds that there is a tendency in modern power stations toward larger combustion space.—*Mechanical Engineering*, May, 1923.

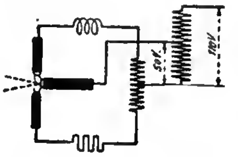
*Water Power in Netherlands East India.*—In a territory about one-fifth the size of the United States, with approximately fifty million inhabitants, a large number of small rivers offer many opportunities for hydro-electric development. A total theoretical capacity of 757,000 hp. was found on the island of Java. A report on Sumatra shows a possible development of 250,000 hp. on the Asahan River.—*Fourth annual report of the Government Service for Water Power and Electricity, Netherlands East India.*

*Hydro-Electric Power on the River Bès, in France.*—G. LEFÈVRE.—The author gives an interesting account of the equipment of a 12,000-kva. hydro-electric power station which supplies an electrometallurgical plant manufacturing iron alloys. Three Francis-type turbines of 4,600 hp. each operate under a head of 144 m. and drive 4,000-kva., three-phase, 50-cycle generators at 630 r.p.m. Two separate 120-kw. excitation sets, driven by two auxiliary Pelton-type turbines and a storage battery, furnish the field current for the generators. The machine voltage is stepped up in three 4,000-kva. oil-insulated and water-cooled transformers from 8,200 to 30,000. A double transmission line of about 10 miles, using reinforced-concrete poles entirely, connects the station to the smelting plant. Three step-down transformers, identical with those in the power station, reduce the incoming voltage again to 8,200, and to these buses are connected three banks of special water-cooled furnace transformers, each bank consisting of three 1,250-kva., single-phase machines with a ratio of 8,200 to 60/120 volts and taps for ± 11 per cent regulation. There are at present five single-phase, 1,000-kw. furnaces, three three-phase, 3,000-kw. furnaces and one rocking furnace in operation.—*Revue Générale de l'Electricité*, April 21, 1923.

## Illumination

*Alternating-Current Projection Arc Lamps.*—B. SCHÄFER.—An arc lamp for motion-picture projectors is described. The author uses a combination of three carbon electrodes, two arranged vertically, one above the other, and a third horizontally. With the aid of a resistor and an iron-core choke coil the two vertical electrodes receive almost 90 deg. phase displaced current, so that the time intervals, during which the light emission is almost zero, are much shorter than with an ordinary two-electrode arc lamp. This avoids any possible interference between the light of the lamp and the speed of the projector shutter. The light output is greatly increased. For a lamp current of 32 amp. a two-carbon type gives 600 cp., while it is claimed that the three-electrode lamp measures 1,400 cp. Practical tests with this lamp in a motion-picture theater gave a very satisfactory performance. — *Elektrotechnische Zeitschrift*, April 12, 1923.

THREE-ELECTRODE LAMP SAID TO GIVE OVER TWICE THE LIGHT OF ORDINARY ARC LAMP



## Transmission, Substations and Distribution

*High-Voltage Submarine Cable in Norway.*—F. HANFF.—To supply fourteen small islands off the Norwegian coast with energy from the power station in Aalesund a large number of cables had to be laid out to connect these islands. The individual lengths of the cable pieces varied from 3,000 m. to 500 m., and the depth of the sea ranged between 10 m. and 360 m. Three-phase cables were designed for 22,000 volts and have a copper cross-section of 3 mm. x 25 mm. or even 3 mm. x 50 mm. The lead sheath is 4 mm. thick and is armored with an outer layer of galvanized-steel wires. The total length of all the cable laid was 30 km., with a weight of 653 tons. No joints under water were permitted, and for each stretch between two islands the proper length of cable was manufactured in one piece. Before shipment each cable was tested with 55,000-volt alternating current and after laying each length was again tested with 85,000-volt direct current for one-half hour. Including all auxiliary work, such as making all pothead connections on land and testing, the entire undertaking was accomplished in twenty-eight calendar days. The article contains a very interesting and detailed account of the many difficulties encountered during this unusual work.—*Siemens Zeitschrift*, April, 1923.

*Endangering of the Bare Direct-Current Neutral.*—C. MICHALKE.—A detailed account of the relative advantages and disadvantages of various methods employed to counteract chemical and electrolytical effects upon direct-current neutral conductors laid under ground without insulation. The paper compiles the answers from a questionnaire sent out to a great number of direct-current plants. The great importance of the proper choice of the conductor and its surroundings, depending upon the chemical nature of the soil and possible stray currents, is emphasized and illustrated from practical experiences. — *Elektrotechnische Zeitschrift*, April 12, 1923.

*Automatic Substations.*—L. C. GRANT.—The author describes the functions of the control apparatus in automatic operation as applied to substations in England and gives some interesting features of cost.—*Electrician (London)*, April 20, 1923.

## Motors and Control

*Large Blooming-Mill Drive.*—A. HARTMANN.—A heavy reversing mill drive is described that is used primarily for the production of 47-kg./m. grooved street-railway rails. It consists of a direct-current double motor and the necessary starting machines. The rating of the motor is 13,250-kw. maximum output at 0 to 60 to 150 r.p.m. in either direction with a maximum torque of 215 meter-tons. Accelerating each time to full speed, the motor can be started, stopped and reversed twenty times per minute. Ingots weighing 2,860 kg. are rolled with twenty-one passes into a rail of 47 kg./m., representing an elongation of thirty-three times. The starting set comprises two symmetrical halves, each with one three-phase induction motor of 2,100 kw. at 6,000 volts (50 cycles), two direct-current generators each of 1,560 kw. at 460 volts, and one 30-ton flywheel. The set revolves at 750 r.p.m. The flywheels are of cast steel and reach the rather high peripheral speed of 141 m./sec. To minimize windage loss they are inclosed in snug-fitting sheet-iron casings. A water-cooled brake with wooden shoes, capable of stopping the converter within six minutes, can be brought into operation. The mill

motor is driven with two or three of the direct-current generators in series, using Leonard connection. The speed regulation from 0 r.p.m. to 60 r.p.m. is obtained by changing the voltage of the starting generators, while from 60 r.p.m. to 150 r.p.m. the field of the motor itself is weakened. This rolling set has a capacity of up to 75 tons of rails per hour.—*Brown-Boveri Mitteilungen*, May, 1923.

*Types of Motor Protection.*—GORDON FOX.—The author considers location of protective devices, National Electrical Code revisions, undervoltage protection, time-element features, phase-failure protection, shunt-field relays, limit switches and overspeed trips and interlocks.—*Power*, May 8, 1923.

*Winding Two-Phase and Three-Phase Induction Motors.*—A. C. ROE.—The author gives practical details and tables for laying out unequal groupings of coils in induction motors having from four to forty-eight coils, two-phase or three-phase. The article gives the reader a clear insight into the possibilities of unequal grouping and an understanding of balance in a winding. —*Industrial Engineer*, May, 1923.

*Electrical Equipment in Wire Mills.* —J. E. MCDONALD.—Several new and interesting installations in the rod-rolling and wire-drawing industries are encountered in the new mills of the Whitaker-Glessner Company at Portsmouth, Ohio. Among these are the automatic coiling and conveying systems, slow start for motor-driven wire blocks, continuous wire-drawing machines and the applications of electric motor and control to practically all processes.—*Iron Age*, May 3, 1923.

## Heat Applications and Material Handling

*Electric Trucks.* — A. CANAC. — A French concern is building storage-battery-driven electric trucks for which are claimed considerable advantages over existing American and English designs. Two 7.6-hp., 155-volt motors drive the rear wheels separately, obviating the otherwise required differential. Between each motor and its driven wheel is interposed, as the most conspicuous innovation of the truck, a reduction-gear case with a gear shift lever, similar to the apparatus used in gasoline cars. On level stretches of the road the normal running gear reduction is used between the pinion of the motor and the wheel, while on grades a higher reduction may be used. This will permit running the motors even on grades at the normal and most efficient speed and will also give a much quicker start of the truck up hill. Consequently a lower starting current will be taken from the battery and the motors will not tend to overheat. The lead-plate battery has a capacity of 250 amp.-hr., and is placed in two boxes of forty cells each. Loaded with five tons, the truck can make up to 20 km. per hour and consumes 0.6 kw.-hr. to 1.0 kw.-hr. per kilometer, or 0.12 kw.-hr. to 0.2 kw.-hr. battery-charging current per ton-kilometer. The fully loaded truck is able to climb grades of 12 per cent to 15 per cent at a speed of 4 km. to 5 km. per hour, at a consumption of 1.0 kw.-hr. per ton- kilometer. The radius of operation is 80 km. per charge.—*Revue Générale de l'Electricité*, April 14, 1923.

## Electrophysics, Electrochemistry and Batteries

*Effect of Electrodeposition of Nickel.* —M. R. THOMPSON.—A number of previous investigations are reviewed, and it is concluded that the results may have been influenced by lack of regulation of the hydrogen ion concentration. It is shown that, if the hydrogen ion is properly controlled, the presence of iron in nickel solutions does not necessarily cause cracking or peeling of the deposits, as it has often been supposed to do. Deposited iron has a primary effect upon the crystalline structure of nickel deposits, rendering the latter finer-grained and therefore probably harder, although more brittle. Occluded basic precipitates containing iron may injure a deposit by making it porous or dark in color.—*Paper presented before American Electrochemical Society, New York*, May 3-5, 1923.

## Traction

*French Locomotives.*—Two new types of direct-current, 1,350-volt locomotives were recently turned over to regular service on the Paris-Orléans and the Paris-Lyon-Mediterranée lines, and their electrical details are described in these issues. The "2-D-2" express locomotive is operated with a twin motor geared to each driving shaft, each motor designed for 675 volts. The hourly output of the engine is 2,400 hp., or 3,200 hp. for five minutes. A maximum level speed of 68 miles per hour can be reached. The tractive effort at the rim of the wheels at the hour rating and 31 m.p.h. is 28,600 lb. The over-all length of the engine is 65 ft. 7 in., and the weight complete is 110 tons (67 tons electrical equipment, 43 tons mechanical parts). Pantograph and third-rail collection is provided. The "D" type freight locomotives are equipped with a single-motor gear drive for each of the four shafts. All motors are built for operation on 1,350 volts. The hourly rating of the engine is 1,730 hp., with a tractive effort of 22,900 lb. at 28 miles per hour. The machines measure over all 40 ft. 8 in. and weigh 64 tons (35 tons electrical equipment, 29 tons mechanical parts). —*Bulletin Oerlikon*, February and March, 1923.

*Extensive Electrified Railway System Proposed.*—A permit from the Interstate Commerce Commission for a 1,307-mile electric railway system in Arizona, Colorado, New Mexico and California has been applied for. The article discusses sources of power, traffic to be handled, passenger service, methods of computing revenue and costs, construction schemes, locomotives, transmission systems, etc. Regenerative braking to utilize the potential energy of down-grade load to pull empty cars up the grade on the return trip is an interesting part of the proposal.—*Electric Traction*, April, 1923.

## Telegraphy, Telephony, Radio and Signals

*Measurement of the Electric Intensity of Received Radio Signals.*—J. HOLLINGWORTH.—The first part of this paper is devoted to a discussion of some of the principles on which the measurement of received signals is based, and the practical application of these principles under working conditions is considered. The latter part describes a system recently developed at the National Physical Laboratory (England) which differs in several details from previous systems. Its operation is described in detail, and some of the possible sources of error and inaccuracy are considered.—*Journal of the Institute of (British) Electrical Engineers*, April, 1923.

*High-Power Radio Station at Herzogstand.* — Built primarily for experimental purposes, this Bavarian radio station has as the most striking feature an antenna which is stretched out between two mountain summits, the station itself being in the valley between. The free span of the five antenna wires, made of heavy steel cables, is 1½ miles, and the lowest point of it comes within 300 m. of the bottom of the valley. The anchor plant on one mountain top is solid, while on the other summit the wires go over a stationary pulley to a small car which can ride freely up or down a short inclined track. The car is loaded so as to give the antenna wires the proper amount of tension. The equipment of the station comprises one 200-kw. Poulsen-arc transmitter and one 200-kw. Schmidt high-frequency generator. It is expected to ascertain in this station the relative merits between these two methods of radio transmission.—*Zeitschrift des Vereines Deutscher Ingenieure*, April 11, 1923.

## Miscellaneous

*Standardized Electrical Machinery.*—C. W. DRESCHER.—This paper describes in minutest detail the production of generators and motors on a large scale with such exact dimensions as to guarantee a perfect interchangeability of their parts. Whether it is a small 7½-watt motor or a 60,000-kw. machine, their shafts, bearings, etc., are produced with sufficient accuracy to insure a perfect fit if a new part is ordered to replace a worn-out one. Elaborate jig and caliber systems designed to carry on manufacturing on such a basis are described, and the influence of the method upon the design of the machine types is shown. In particular, examples are given of machines built by one concern which adopted such a system for the various departments in its plant. — *Elektrotechnische Zeitschrift*, May 3, 1923.

# Scientific and Industrial Research

A Department Devoted to Reports of Investigations Contemplated or Completed, Research Facilities Available and Suggestions for Co-operative Work

*Conducted by* PROF. VLADIMIR KARAPETOFF, *Cornell University, Ithaca, N. Y.*

[ PRINTED IN THE THIRD ISSUE OF EACH MONTH ]

[When investigations which have been completed are, in the opinion of the editors, of wide enough interest to the field we serve, details thereof will be presented in other parts of this paper. Contemplated research or that which appears to have limited appeal will be only briefly reported in this section, but details may be had by communicating with the investigator or institution named in the report. Readers are referred to the department "Digest of Electrical Literature" for investigations reported in other journals. The news and engineering sections should also be followed for research reported before technical societies.]

## Research Completed

### Boiler Feed, Measurement of Concentration of Salts in

A new conductivity cell has been developed for direct insertion into a boiler drum in order that the concentration of salts in a boiler may be easily determined. The cell may be safely used on pressures up to 300 lb. per sq.in. The electrodes are made of heavy nickel and the insulating structure is practically unbreakable. The concentration indicator used with the cells may be calibrated in total dissolved solids or chlorine content. The advantages of this new cell are the elimination of sampling and of extra piping.—*Instruments and Measurements Committee of the A. I. E. E.*

### Circuit-Breaker, Oil, Large Resistance Bypass

Current-limiting reactors are coming more and more into use in this country on large systems to limit short-circuit current, thus protecting generators and limiting the duty of the oil switches. Abroad for the same purpose more and more are large bypass resistances used, which are built integral with the breaker and which by a combination of contacts are switched into the circuit before the opening occurs. One of the largest railroad companies in Europe and the firm of Brown-Boveri, Baden, Switzerland, made thorough tests on such breakers. The results obtained showed that with a resistance of four times the short-circuit impedance the duration of the arc is decreased to one-quarter, the energy liberated in terms of heat to one-tenth, the pressure produced during interruption to one-fifteenth, and the quantity of gas produced about to one-fifth of the values without resistance.—*G. Bruehlmann* (from *Brown-Boveri Mitteilungen*).

### Drills, Electric, for Coal Mines

As a result of extensive tests, certain makes of electric drills have been approved for use in gaseous or dust-laden mines. The formal approval of these drills means that the bureau is convinced that if they should be inadvertently operated while immediately surrounded by an explosive mixture of gas or gas and coaldust, as the result of accidental interference with the ventilation or otherwise, the atmosphere surrounding the drill would not be ignited even though an explosion took place within the equipment.—*United States Bureau of Mines, Washington, D. C.*

### Relay for Keeping Power Within Limits

A new induction-type relay has been produced, similar in appearance to an induction watt-hour meter, to indicate when the load exceeds or falls below a predetermined value. These relays are provided with two separate driving elements, each element having a current and a potential coil, which drive two disks mounted on a single vertical shaft. The shaft controls the operation of a set of double-throw contacts, which energize the coils of an auxiliary relay on over-power and short-circuit them on under power, thereby quickly and automatically relieving the main contacts of the relay of the burden of the circuit-breaker tripping current.—*General Electric Company, Schenectady, N. Y.* [Such relays should prove useful where power is sold or purchased on a demand basis, and also where a machine is to be started or stopped, depending upon the load conditions.—EDITOR.]

### Short-Circuits in Power Networks

A miniature three-phase alternating-current generating and transmission system with adjustable resistance, reactance and capacitance units has been constructed and is used for the solution of various network problems, including those of short circuits. —*O. R. Schurig, Schenectady, N. Y.*

### Transformers, Cooling of

A new system of cooling large oil-insulated transformers which must be operated in locations where an adequate supply of cooling water is not available. This system comprises a battery of radiators, installed either on the transformer or in a separate location, and in which the natural flow of oil between the transformer tank and the radiator is accelerated by the external application of low-pressure air currents in numerous small jets.—*General Electric Company, Schenectady, N. Y.*

### Transformer Tests, Current, Lead Resistance in

To obtain accurate results employing current transformers for the measurement of large amounts of power supplied at high voltage, it is very essential that the transformers be tested when connected to a secondary circuit which is identical with or equivalent to the circuit with which they are used. It was found convenient by the calibrating laboratories of the Bureau of Standards to insert in the secondary circuits of the transformers an additional resistance (about equal to the actual resistance of the apparatus which would be installed in the particular installation) for a precise laboratory test.—*Bureau of Standards, Washington, D. C.*

## In Progress or Purposed

### Lightning Arresters for Low-Potential Circuits

Tests with steep wave fronts indicate (a) that a lightning arrester to be most efficient as a protective device should have a minimum impedance to flow of surge current so as to permit a very high current to flow at the instant of lightning discharge; (b) that it is apparently entirely possible to devise an arrester which will have a maximum potential across its terminals that will be less than the primary bushings and the primary windings of line transformers as now constructed for distribution voltages will withstand. It is confidently expected that arresters meeting this requirement will be produced by one or more manufacturers and available for general use within the next few years. When this result is achieved, then disturbances from lightning will be practically eliminated from our low potential distribution circuits.—*A. I. E. E. Sub-Committee on Lightning Arresters.*

### Rope, Hoisting, Non-destructive Magnetic Tests on

It is proposed to prosecute the investigation along three general lines: (1) Laboratory study of the effect on the magnetic properties of the various factors which cause deterioration of a hoisting rope in service; (2) development of methods and instruments for magnetic tests under service conditions; (3) actual field tests to determine the possibility of practical application.—*R. L. Sanford, Bureau of Standards, Washington, D. C.*

### Transmission Lines and Cables, Artificial

An investigation is being made which it is hoped will lead to the possibility of representing a power network artificially. The three-phase artificial line with distributed constants representing 110,000-volt practice with a length of 400 miles has been constructed and its constants checked. In order to be able to represent cable circuits as well, an artificial power cable is being designed along the same lines, so that it will contain inductance as well as capacity and resistance and therefore properly transmit a transient wave front.—*F. S. Dellenbaugh, Jr., Massachusetts Institute of Technology.*

### Welding, Contact Flash Method of

An electric welding machine embodying a new principle will soon be available. The weld is made almost instantly. The nearby metal is not heated and a weld can be handled immediately after being removed from the welder without burning the hands. At present the contact flash process welds stock of 1-in. diameter on an experimental welder, and it is expected to weld stocks 1½ in. in diameter or larger when a final model is built.—*H. A. Woofter, Lynn, Mass.*

### Welding, Electric Seam

Much development work has been carried on within the last two years. Until recently two sheets of No. 20 gage stock was the maximum limit for flat commercial work, while two sheets of No. 18 gage stock could be seamed by previously scarfing the edges. The limit in length of seam for this work was about 2 ft. Now, however, two ⅛-in. sheets have been welded on an experimental machine, and the length of seam can be practically anything that can be procured in commercial stock. This method can be applied to the manufacture of steel barrels, casks, tanks, culverts, smokestacks, ventilators, conveyor tubes, heating and ventilating pipes, etc.—*H. A. Woofter, Lynn, Mass.*

## Apparatus Available

### Phase Advancer for Induction Motors

A small experimental phase advancer has been developed suitable for research. It has the appearance of a three-phase commutator motor with no stator winding. After a phase-wound induction motor is brought up to speed in the usual manner, the brushes of the phase advancer are connected to its slip rings. The power factor of the motor may then be kept at approximately 100 per cent over a wide range of load.—*Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.* [Such a phase advancer is used to some extent in Europe for power-factor correction of large induction motors, and it is desirable to acquaint the oncoming generation of engineers with its theory and possibilities.—EDITOR.]

## Suggestions for Research

### Conduits, Underground, Trenches for

In many places in New Orleans submerged cypress stumps are found which have to be cut through or removed in making trenches for cables or pipes. The wood is perfectly preserved and quite hard. Being in a thickly populated district, it is hardly possible to use the familiar methods for removing stumps, applicable say in an open field. It will be of interest to us to have some machine or method developed which would permit cutting through such stumps at a reasonable speed and at moderate expense.—*F. G. Frost, New Orleans Public Service, Inc.*

### Fuses, High Voltage, for Potential Transformers

On numerous occasions the fuses on the 13,200-volt side of potential transformers opened in service without apparent cause. A microscopic examination in some cases has shown some corrosive chemical action. Tests on 0.004-in. wire used in some of our fuses have shown that at 13,000 volts the wire is entirely surrounded by corona which may cause this deterioration. A further investigation of this trouble is desired; in the meantime it is recommended that such fuses be renewed at fixed intervals.—*A. F. Bang, Pennsylvania Water & Power Company, Baltimore.*

### Monel Metal, Arc Welding of

Attempts to arc-weld monel metal have not been successful in the past, but it seems that better results can be obtained by using a deoxidizing coating and by making the welding rod positive, instead of the work. For some tests in this direction see the *Journal* of the American Welding Society, May, 1922.

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## Stratton Inaugurated

**New Head of Massachusetts Institute of Technology Is Welcomed by Distinguished Men**

IN THE presence of a distinguished assemblage of educators, scientists, engineers, publicists and leaders of industry, Dr. Samuel Wesley Stratton was inaugurated as president of the Massachusetts Institute of Technology at Symphony Hall, Boston, on Monday of this week. The dependence of modern civilization upon engineering education and research was the text of the inaugural exercises, led by Frederick P. Fish of Boston. Mr. Fish emphasized the pioneer work of the institute in engineering education and touched upon the value of the broad training given in addition to technical instruction in meeting the intense strain upon modern social and business organization resulting from industrial conditions based upon the most extraordinary development in science that the world has ever seen.

Governor Cox brought the greetings of the state; Major-Gen. George O. Squier, U. S. A., saluted the new president and paid a warm tribute to his work at Washington; Prof. Edward F. Miller voiced the welcome of the institute's instructing staff; President Emeritus Charles W. Eliot of Harvard outlined the pioneering work in education achieved by the institute as a private organization, pointing out that public institutions can never be expected to do the pioneering work of education; Prof. C. E. A. Winslow of Yale spoke on behalf of the alumni and President John C. Merriam of the Carnegie Institution of Washington emphasized the value of training penetrating far beyond superficial technique for the engineer of the future. While there is no limit to the extent to which fundamental research may go, President Merriam said, it is expected that the results shall be used to help in the work of the world.

### Value of Research Laboratories

In his inaugural address President Stratton gave a masterly review of the effect of science in the evolution of industry, sketching the progress of engineering in the fields of physics and electricity for the past century and pointing out the increasing demands of industry for highly trained engineers. Touching upon the value of the research laboratory, the speaker said that one single discovery may be worth many times the cost of such a laboratory, while at the same time it is turning out men trained to analyze and solve difficult problems, whether they are found in engineering, in scientific laboratories or in industry — a product of inestimable value.

## Plans Laid for City Operation of Milwaukee Utility

The latest developments in the controversy between the city of Milwaukee and the Milwaukee Electric Railway & Light Company over a contract whereby the city is to take over and operate the electric light and power and street-railway systems of that company were unfolded by Fred S. Hunt, chairman of the public utilities acquisition committee which has been investigating the public utilities question for the city nearly five years, in a recent semi-public talk. Plans are now being made for the drawing up of a new contract between the city and the company as to rates and service which will be submitted to the Common Council in about a month. This contract must be approved by the State Railroad Commission and then submitted to a referendum of the voters of the city.

The properties to be covered by the contract, including both electric plant and street-railway lines in Milwaukee and vicinity, have been valued at about $50,000,000, Mr. Hunt said, for the purposes of the proposed agreement. The company is now paying taxes of nearly $1,300,000 a year.

The city cannot buy the electric light and power and street railway properties of the Milwaukee Electric Railway & Light Company because of lack of funds, Mr. Hunt continued. He stated that the committee had been given access to the company's books. Under the service-at-cost plan to be proposed the city and company will virtually enter a partnership. The value of the company's property and the rate of return will be agreed upon. All profits over this will be applied toward the purchase of the plants by the city or used for extensions to belong to the city. The city can also use its credit to raise money for extensions and improvements which will belong to the city and be leased to the company for operation. A considerable part of the control now exercised over the company by the State Railroad Commission will be vested in the city, the commission being called in when differences arise.

The city and company will thus become partners, and surplus profits will be applied, according to the plan as expounded by Mr. Hunt, to bring about gradually city ownership of the utilities.

## Franchise Is Refused

**Colorado Springs Electors Reject Proposal to Continue Service from Existing Local Company**

BY THE decisive vote of 2,948 to 866, the electors of Colorado Springs, Col., on Tuesday refused the twenty-five-year license sought by the Colorado Springs Light, Heat & Power Company. The present franchise of that company expires on Sept. 8, and it cannot be predicted whether the city will offer a counter proposal to the company, grant a franchise to some other utility company or seek some way in which to establish a municipal plant.

The last-named project suffered a setback when the report of Gen. George W. Goethals, who, as already stated in these columns, had been employed by the central-station company to report on the situation, made the result of his survey of the Pike's Peak watershed known, declaring that it does not contain enough water to make it possible to serve Colorado Springs through an all-hydro-electric development and that a steam plant for auxiliary service will continue to be necessary. This finding was awaited with much interest by Colorado Springs and the electrical industry of Colorado in view of an earlier report by G. G. Anderson, an irrigation engineer of Los Angeles, declaring that an ample supply of water was available to meet all requirements. In his report General Goethals declared that the cost of water development would be more than $2,000,000, compared with $597,000, the estimate of city engineers.

Under the terms of the old franchise title to the already existing hydro-generating plant at Manitou passes to the city, the reserve steam plant at Colorado Springs being left in the hands of the central station.

## Mississippi Power & Light Company Organized

The Mississippi Power & Light Company has been recently incorporated in Maryland to acquire the property and business of four Mississippi companies—the Delta Light & Traction Company of Greenville, the Jackson Public Service Company of Jackson, the Vicksburg Light & Traction Company of Vicksburg and the Columbus Railway Light & Power Company of Columbus. These companies have been owned and operated by separate interests, most of which were outside the state,

.ne properties have never been in-.sively developed.

The new company will be managed by H. C. Couch and associates, who have operated successfully for the past ten years the Arkansas Light & Power system and are thoroughly familiar with the territory. The engineering firm of Ford, Bacon & Davis has reported that there are unusual opportunities for rapid expansion, both by taking on additional customers in communities now served and by extending lines to adjacent communities.

# Power Club Acts on Temperature Ratings

### Rescinds Its Two Previous Standards and Approves New "Recommended Practice" for 40-Deg. Rise—Year's Trial Proposed—Timmerman Elected President

THE Electric Power Club at its meeting in Hot Springs, Va., this week took a great stride forward in disposing of the old temperature rating question by abandoning both of the former adopted standards and by adopting as "recommended practice" a 40-deg. rating without overload guarantee. The formal statement of the board of governors on this question is as follows:

"The Electric Power Club has rescinded its two 'Adopted Temperature Rating Standards' on general-purpose motors:

"(1) The 50-deg. motor without overload guarantee, and

"(2) The 40-deg. motor with 25 per cent overload guarantee for two hours; and has approved as 'recommended practice' the following:

"'(a) An open-type general-purpose motor shall be capable of carrying full rated load continuously with a temperature rise not exceeding 40 deg. C.

"'Note.—Such a motor should be so designed as to be capable of carrying sustained overloads (in no event exceeding 50 per cent overload) within a temperature of 90 deg. C. (measured by thermometer).

"'(b) That it is the sense of the Electric Power Club at this time that general commercial practice of the ensuing year will probably lead to the unanimous support of the club to the adoption of a single-rating temperature standard for general-purpose motors without overload reference of any character.

"'(c) That within a year the "recommended practice" referred to in paragraph (a) be submitted to the Electric Power Club for vote as an "adopted standard."'"

By this action the club has solved one of the troublesome commercial engineering problems which have been continuously before the industry in one form or another for seven years.

Sessions of the convention, which was the largest the club has ever had, were held on Monday, Tuesday and Wednesday. President Russell, who closed two years' administration at this meeting, called attention in his address to the constructive work of the various sections and of the club and gave credit for all of this to the men who had devoted so much time to active committee work to bring about agreement on many difficult engineering and commercial questions. He presented actual figures of the number of "man-days" spent, which were remarkable for an organization of the size of the Electric Power Club.

The club authorized a broadening of the scope of the electrical measurement section so that it now includes indicating, integrating and recording meters. Three new concerns were elected to club membership, the Sundh Electric Company, the Wilson Welder & Metal Company and the Sewickley Electric Manufacturing Company.

The club took formal action to become a sustaining member of the American Engineering Standards Committee. Standards for step-up transformers were agreed upon, previous transformer standards having applied principally to step-down transformers. The transformer section also issued at this meeting a published booklet of general instructions for the care and operation of power transformers which is obtainable from member companies. Synchronous motor standards, circuit-breaker definitions and specifications for building equipment-control apparatus were adopted.

#### Trade Association Opportunities

At the dinner on Tuesday evening the principal address was by F. M. Feiker, who spoke on the opportunities of trade associations to be of greater service to their industries by the gathering of statistics, the support of programs of simplification and similar co-operative efforts which have been pointed out as lawful by the Commerce Department.

A. L. Ashby of the Westinghouse Electric & Manufacturing Company addressed the club on Wednesday on the subject of contracts as related to national distribution, showing points to be watched on account of variation in state laws. R. W. Gardner of the Otis Elevator Company addressed the club on methods of preventing waste in manufacture.

J. M. Barr, F. S. Hunting, J. A. Jeffrey and A. E. Waller were elected governors to fill the places of R. J. Russell, C. H. Roth, T. E. Barnum and C. L. Collens, 2d, whose terms had expired and who under the new rules were not eligible for re-election. At a meeting of the new board of governors the following officers were elected: President, A. H. Timmerman of the Wagner Electric Manufacturing Company; vice-president, James K. Bass of the Kimble Electric Company; secretary, J. M. Barr of the Louis Allis Company; treasurer, H. F. Stratton of the Electric Controller & Manufacturing Company.

## Lively Contention Over Pike Rapids, on Mississippi

No decision was made by the Federal Power Commission following a hearing on June 7 in the controversy over the development of Pike Rapids, 12 miles below the town of Little Falls, Minn., on the Mississippi River. The commission directed the Little Falls Water Power Company and the Pike Rapids Power Company to submit financial statements and engineering and legal briefs.

James O. Heyworth, a Chicago engineer, contended that the Pike Rapids company was in a position to put in the development at a cheaper unit cost and with all arrangements made for immediate operations. M. O. Leighton, who represented the Little Falls company, attacked the safety of the works proposed by the Pike Rapids company.

## Edison Visits New York's Truck Show

©Underwood & Underwood, N. Y.

THE annual electric truck show under the auspices of the New York Edison Company, held this year during the N. E. L. A. convention last week, was well attended and, as usual, attracted much interest from those concerned in city transportation of materials and merchandise. Among the visitors was Thomas A. Edison, who appears on the left of the picture George B. Cortelyou, president of the Consolidated Gas Company, is in the center and Arthur Williams, New York Edison Company, on the right.

# Supreme Court Decides Many Points

**Prohibition of Extrastate Sale of Gas Unconstitutional—Kansas Industrial Court Deprived of Power—Mennen Verdict Sustained—Other Cases of Import to Utilities**

A NUMBER of decisions with a special bearing on the regulation of public utility companies or the organization of trade associations have been made by the United States Supreme Court in the last eight or ten days. Below will be found digests of five such findings. Under "Recent Court Decisions," on page 1435, are digests of two others—one upholding the finding of a lower federal court in Brush Electric Company vs. Galveston, that a suit cannot be brought on the ground of confiscation before rates have been put into effect and where estimates of income are based on the business of former years, and the other, in the government's suit against the American Linseed Oil Company and others, forbidding the exchange of sales information and quotations through an outside agency.

## Ban on Gas Export Beyond State Boundaries Illegal

A decision of the highest court in the land which involves a possible application to state laws designed to limit the exportation of electrical energy generated within the state was handed down on Monday of this week in a suit brought by the States of Pennsylvania and Ohio against West Virginia. This suit was instituted to restrain West Virginia from putting into effect a law compelling natural-gas companies supplying gas taken from within the state to serve consumers within its borders in preference to those outside the state.

In delivering the majority opinion Justice Van Devanter said: "Natural gas is a lawful article of commerce, and its transmission from one state to another for sale and consumption in the latter is interstate commerce. A state law, whether of the state where the gas is produced or that where it is to be sold, which by its necessary operation prevents, obstructs or burdens such transmission is a regulation of interstate commerce—a prohibited interference. The West Virginia act is such a law. Its provisions and the conditions which surround its operations are such that it necessarily and directly will compel the diversion to local consumers of a large and increasing part of the gas heretofore and now going to consumers in the complainant states and therefore will work a serious interference with that commerce."

The facts that the pipe-line companies are engaged in a quasi-public business and that gas is a natural product of the state and has become a necessity therein do not, Justice Van Deventer said, afford "power to regulate interstate commerce, which is what the act attempts to do. The power is lodged elsewhere." He concluded:

"On full consideration, we reach the conclusion that the act is unconstitutional; that the apprehensions of the complaining states respecting the injury which will ensue from its enforcement are well founded, and that it obviously will operate most inequitably against those states. In this situation the appropriate decree is one declaring the act invalid and enjoining its enforcement."

Justices Holmes, Brandeis and McReynolds dissented, Justice Holmes holding that there was nothing in the commerce clause "to prevent a state from giving a preference to its inhabitants in the enjoyment of its natural advantages. The statute," he said, "seeks to reach natural gas before it has begun to move in commerce of any kind. It addresses itself to gas hereafter to be collected and states to what uses it first must be applied. The gas is collected under and subject to the law, if valid, and that moment it is not yet a matter of commerce among the states. I think that the products of a state,until they are actually started to a point outside, may be regulated by the state notwithstanding the commerce clause."

## Kansas Industrial Court Cannot Fix Wages

The Kansas Court of Industrial Relations received what may prove to be its deathblow when the United States Supreme Court, on June 11, in a unanimous opinion read by Chief Justice Taft, declared that the Industrial Court had no authority to fix wages of employees of the Charles Wolff Packing Company. While the Supreme Court did not directly declare the entire act creating the Industrial Court unconstitutional, the decision greatly limits the activities of the Kansas industrial tribunal and the effect probably will be to nullify the objects for which it was created.

The Kansas act gave the Industrial Court authority to adjust disputes and fix wages and conditions of labor in public utilities and in industries producing food, clothing and fuel. While an employee could not be prevented from quitting his job, concerted action, such as a strike, in the face of a mandate from the court was declared illegal.

In the case at issue the company resisted payment of higher wages and appealed to the United States Supreme Court from a mandamus issued by the Supreme Court of Kansas.

In his decision Chief Justice Taft says: "It [the act creating the Industrial Court] curtails the right of the employer on the one hand and of the employee on the other to contract about his affairs. This is part of the liberty of the individual protected by the guarantee of the due-process clause of the Fourteenth Amendment." No effort was made in the opinion to lay down a working rule by which readily to determine when a business has become "clothed with a public interest."

"It has never been supposed, since the adoption of the Constitution, that the business of the butcher, the baker, the tailor, the wood chopper, the mining operator or the miner was clothed with such a public interest that the price of his product or his wages could be fixed by state regulation," the opinion states.

"To say that a business is clothed with a public interest is not to import that the public may take over its entire management and run it at the expense of the owner. The extent to which regulation may reasonably go varies with different kinds of business. The regulation of rates to avoid monopoly is one thing. The regulation of wages is another. We think the Industrial Court act, in so far as it permits the fixing of wages in plaintiff-in-error's packing house, is in conflict with the Fourteenth Amendment and deprives it of its property and liberty of contract without due process of law."

## Mennen Decision Upheld

On Monday of this week the United States Supreme Court handed down a decision declining to review the finding of the Circuit Court of Appeals in the action brought against the Mennen Company by the Federal Trade Commission. In this case, which was noted in the ELECTRICAL WORLD for March 17, page 646, the Circuit Court held that co-operative or mutual associations, although buying in wholesale quantities, are retailers and that, in a case presenting no circumstances of fraud or monopolistic control or conspiracy, a manufacturer is at liberty to adopt any price schedules which he considers fair to the various branches of trade to which he sells. The commission denied that the manufacturer had this liberty and contended that the manufacturer could vary his price schedules only for quantity, actual differences in cost of transportation and various other elements which the commission inferred from the Federal Trade Commission act and the Clayton act.

## One Utility Wins, Another Loses in Rate Appeals

Two cases involving questions of the valuation of a public utility for rate-making purposes were decided by the United States Supreme Court on Monday last. In Bluefield Waterworks & Improvement Company vs. Public Service Commission of West Virginia, on appeal from the state courts, the Supreme Court held that the rates fixed for water service in 1920 at Bluefield and designed to give a return of 6 per cent were inadequate and confiscatory. The company had alleged the value of its property to be greatly in excess of that fixed by the commission and complained

the commission did not allow for increased costs of replacement between 1915 and 1920.

In the case of the Georgia Railway & Power Company and the Atlanta Gas Light Company the Supreme Court affirmed the decree of the lower courts dismissing a suit against the Railroad Commission of Georgia to restrain reduced rates for Atlanta's gas supply. Although Associate Justice McKenna dissented from the majority opinion, holding that replacement value, as fixed in principle by the court in the cases of the Southwestern Telephone Company and the Bluefield Waterworks & Improvement Company, had not been applied in this case, the majority opinion pointed out that in the case before the court the Railroad Commission had carefully considered replacement value and increased costs, although it did not allow all the claims of the company in this regard; hence the case differed from the others cited as precedents.

## New York Electrical Board

**Activities to Cover Many Phases — Sections to Meet Needs of Investors, Creditors, Bankrupts and Others**

DEFINITE plans for promoting the welfare of the entire electrical industry have been made by the recently organized Electrical Board of Trade of New York City, the formation of which was noted last week (page 1375). Charles L. Eidlitz, the board's chairman, informs the ELECTRICAL WORLD that the board's intended activities cover many phases. These include a special section in the board's offices for an advertising pool as an aid to newspaper advertisers, a legislative section to consider state and federal legislation, a patent bureau where inventors may list their inventions for the purpose of selling them to manufacturers, a credit bureau, registration of bankrupts, a section which will collect information as to excess stocks or shortages on the shelves of its members, an exhibition of new apparatus, historical exhibits for the purpose of creating public interest, advice to those contemplating going into an electrical business, and a special section which will attempt to stop sales and purchases of stolen electrical goods.

The organization will be actively controlled by a board of governors consisting of three representatives elected from each branch of the industry, and it is estimated by Mr. Eidlitz that when in full operation the board will number about thirty-six men, who will represent several thousand corporations, firms and individuals. The temporary officers elected were named in these columns last week. A temporary board of governors consisting of twenty-eight men was also elected.

The constitution of the board says in part:

"The objects of the Electrical Board of Trade of New York shall be to promote generally the interests of the electrical industry, to deal with problems concerning or affecting the industry, to represent the industry in public affairs or legislative matters affecting the industry, to be the central organization and headquarters for the entire electrical industry of the city of New York and territory hereinafter mentioned. Its activities shall be directed only along constructive lines within the industry by the encouragement of sound, ethical and progressive business methods. The board shall not, however, in any way deal with prices nor shall it foster combinations or agreements in restraint of trade."

## Ford License Executed

**He Will Install 18,000 Kva. at High Dam in Hydro Units and About 15,000 Hp. in Steam Plant**

A LICENSE extending to Henry Ford the right to utilize the High Dam on the Mississippi River at St. Paul for a period of fifty years has finally been executed by the Federal Power Commission. The license covers the construction of a power house on the existing substructure at the St. Paul end of the dam. The power house will be equipped with four turbo-generators, each with a capacity of 4,500 kva., or 500 kva. in excess of the minimum figure named in the preliminary permit.

Three-foot flashboards will be placed on the dam so that water may be ponded during off-hours and so that the head may be raised in ordinary high water. Mr. Ford will construct a steam auxiliary on the bank adjacent to the hydro-electric power house. The capacity of this auxiliary has not been determined finally, but presumably it will be 15,000 hp., since there is about that much difference between his firm power and his secondary power at the dam. This steam plant will be designed to burn the plant refuse and to furnish steam for heating the factory.

Mr. Ford's representatives presented to the Federal Power Commission a signed contract with the Northern States Power Company whereby the latter agrees to use all of the available power in excess of the needs of the manufacturing plant at a fixed price of 2½ mills per kilowatt-hour.

It is understood that Mr. Ford is planning to manufacture storage batteries for his cars at this plant. The estimated output of the plant will be 6,000 batteries per day. He desires to establish a barge service between St. Louis and St. Paul to bring the raw materials entering into battery construction up the river and return with the manufactured product.

The license was accepted with the reservation that an argument later may be presented by Mr. Ford's representatives for a reduction in the capital sum being paid for the use of the government structure and for a reduction in the rate of interest. In the report of the Chief Engineer it is suggested that $70,000 per annum would be fair reimbursement to the government. The license calls for a rental of $95,440 per annum.

## Eber Bill Defeated

**Wisconsin House Is 51 to 39 Against a Two-Year Postponement of Electrical Development**

THE Eber water-power bill, providing for a cessation of water-power development in Wisconsin by private interests for a period of two years and appropriating $25,000 for a survey of water-power sites by the Railroad Commission, was killed by the Assembly when it came up for final passage in amended form. As reported in the ELECTRICAL WORLD for May 26, page 1230, this bill originally made the period of delay six years. Its defeat even in the amended form is thought to mark the final downfall of an attempt to stifle hydro-electric progress in Wisconsin. The vote was fifty-one to thirty-nine in favor of the indefinite postponement of the measure.

The proposed plans of Henry Ford with respect to water-power projects in Wisconsin figured prominently in the defeat of the measure. Opponents of the bill said it would prevent Ford from going through with his water-power development program in Wisconsin.

## Pacific Gas & Electric Doubles Business in Six Years

For the year ended Dec. 31, 1922, the Pacific Gas & Electric Company of San Francisco showed, as indicated in its seventeenth annual report, gross operating revenue of $38,593,562 and sales of electricity totaling 1,098,123,000 kw.-hr., as compared with a gross operating revenue of $19,813,381 and total sales of 587,144,000 kw.-hr. in 1917, thus nearly doubling its receipts and its sales of energy in a six-year period. In the nine years beginning with 1914 gross income increased 128 per cent, sales of electricity 142 per cent, number of consumers 70 per cent, and number of stockholders (because of the momentum from the customer-ownership movement) 772 per cent.

Deducting from the gross revenue for 1922 charges for maintenance, operation, taxes, depreciation and interest, a net income of $6,587,159 was shown. Adding the balance at the beginning of the year ($7,946,366) and deducting dividends and miscellaneous adjustments, there was left a balance in sinking funds and unappropriated of $8,593,388.

In its electrical business the company serves eighty-nine incorporated cities, 142 villages and towns and a suburban area of 35,000 square miles with a population in excess of a million and a half, occupying approximately 278,000 houses, of which less than 2,000 are unwired. The total output of energy during 1922 was 1,608,940,735 kw.-hr., an increase over 1921 of about 120,000,000 kw.-hr. Of this, 69.9 per cent represents the output of the company's twenty-eight hydro-electric plants, 15.6 per cent was produced in its four steam-electric plants, and 14.5 per cent represents power purchased from other concerns.

## Colorado River Compact

**League of Southwest Listens to Paper Indorsing It as Drawn—Other Big Plans Discussed**

AT AN open conference called by the League of the Southwest on June 7, 8 and 9 at Santa Barbara, Cal., to discuss Colorado River problems and Indian affairs, earnest discussion was given to the present status of the Colorado River compact, which has thus far been passed upon favorably by the legislatures of all the states involved except Arizona.

Robert Sibley of San Francisco, who had traveled ten thousand miles to make a detailed study of the situation, reported, saying:

"Virtual unanimity prevails among the leaders in the seven states involved that, owing to differences in seasons, crops, soil and physical conditions of climate, it is wise to separate the Colorado River drainage basin into two areas, the upper basin and the lower basin, as defined in the proposed Santa Fé treaty now under consideration. The waters of the Colorado River basin under wise adjudication are ample to bring under cultivation all irrigable lands of reasonable approach from the main waters of the river. The Colorado River basin, involving as it does interstate and international problems of floods, irrigation, power and possible navigation, is a matter requiring the closest co-operation of the seven states involved and the federal government. The raising of funds for the complete development of the river, involving as it will a sum probably exceeding a billion dollars, requires the most thorough co-operation of public and private finance. Hence it would seem that the proposed Santa Fé treaty should be adopted in its present form.

### Permanent Commission Favored

"Immediately thereafter the seven states and the federal government should unite in bringing to life a permanent Colorado River commission, composed of men of brilliant attainment and constructive ideals in problems similar to those to be met with in Colorado River development — men thoroughly representative of the seven states involved and of the federal government. This commission should have full and complete authority to supervise the distribution of the waters and building of dams in the canyon district and the disposition of power franchises to private and business enterprises that may desire them. The continual aim of the commission should be so to encourage all involved in the Colorado River development that broad policies of use for this great public resource may be executed at once and the wealth of water and power it contains be brought to Western homes, farms and industries by the fullest co-operation of federal, state, city and private enterprises."

At the conference two other papers of interest to the electrical industry were presented—one by W. G. Clark, a consulting engineer of New York City, who had prepared a detailed study for power development at Boulder Canyon which would require a dam a thousand feet in height; the other by George H. Maxwell of Phoenix, Ariz., executive director of the National Reclamation Association, who presented a preliminary study of a high-line canal to serve Arizona and southern California, involving two dams 700 ft. in height, the development of a million horsepower and the bringing of the Colorado River power not only to the Imperial Valley of California but also to the Los Angeles, Santa Barbara and San Diego districts.

## Two More Generators Ordered for Holtwood

For supplying power to two new customers, one of which is the Edison Light & Power Company of York, Pa., and the other the Chester Valley Electric Company of Coatesville, Pa., the Pennsylvania Water & Power Company has ordered from the Westinghouse Electric & Manufacturing Company two 15,000-kva., 80 per cent power factor, three-phase, 13,200-volt, 60-cycle, 94.7-r.p.m. waterwheel generators for installation in its Holtwood station. The current will be stepped up at Holtwood to 73,000 volts and transmitted by double-circuit tower lines to both of these customers. The lines will be designed and insulated for an ultimate voltage of 110,000. The construction work at Holtwood will be done by Day & Zimmermann, of Philadelphia, who operate the customer companies at York and Coatesville referred to.

## El Dorado Hydro Plant Will Be Finished This Year

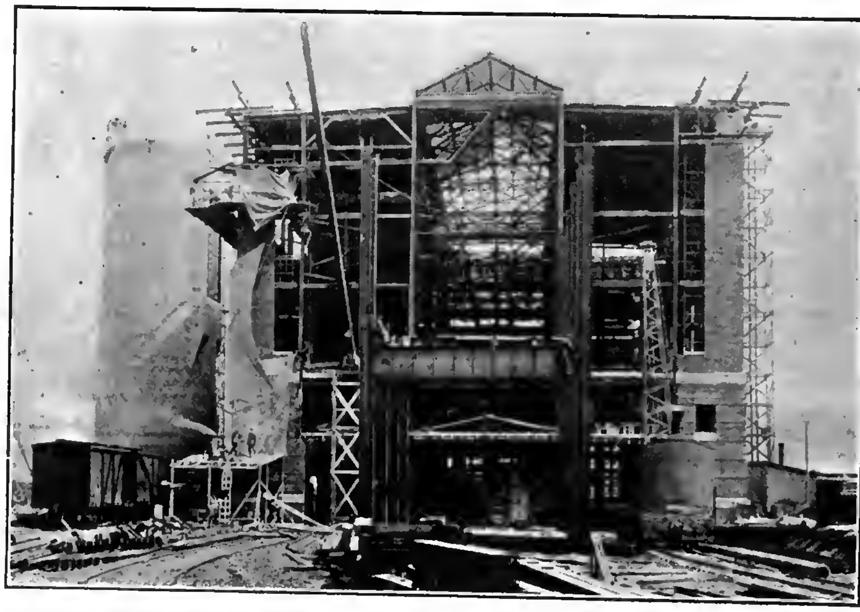
Construction work on the development of the El Dorado hydro-electric project of the Western States Gas & Electric Company is proceeding so well that completion is by December of this year virtually assured, according to F. C. Shenehon, vice-president and general manager of construction and engineering, Byllesby Engineering & Management Corporation, who recently completed an inspection tour of the work in progress on the South Fork of the American River, not far from Placerville, Cal.

"We are busy on all work below the snow line," said Mr. Shenehon. "Construction of the power house is well under way, and work on the flumes, penstock and forebay dam is progressing rapidly. Upward of a thousand men are now employed. By the middle of June it will be possible to resume work in earnest on the construction of the storage dam at the Twin Lakes reservoir site.

"The new station will develop a total of 27,000 electrical horsepower, and available power rights will permit its enlargement to a capacity of 100,000 horsepower as the need arises. The present generating equipment will consist of two units of equal size, driven by impulse wheels operating under a head of 1,750 ft."

The Western States Gas & Electric Company serves a total population of more than 107,000, the principal cities in its territory being Stockton, Eureka and Richmond. About thirty smaller places are supplied.

## Pine Grove Plant Rapidly Nearing Completion



THE first 50,000-kw. section of the East Penn Electric Company's new plant at Pine Grove, Pa., is rapidly nearing completion, considerable progress having been made on the building and the stack since the above photograph was taken. This power house, which was designed and is being erected by the J. G. White Engineering Corporation, is to have an ultimate rating of 300,000 kw. It is a mouth-of-mine plant, being built on Swatara Creek, within four or five miles of anthracite coal fields, permitting the use of "fines" or powdered fuel under the boilers of the station.

## ...ific Coast Men to Discuss High-Rated Apparatus

The annual convention of the Pacific Coast Electrical Association, which is affiliated with the N. E. L. A., will be formally opened Tuesday noon, June 19, when the delegates will be the guests of the San Francisco Electrical Development League at a luncheon. Preceding the luncheon there will be a parade of electrical vehicles now in use in San Francisco under the auspices of the Electric Transportation Club. The convention will be held at the Fairmont Hotel. The program for the technical sessions is as follows:

TUESDAY, JUNE 19

*Afternoon.*—Report of apparatus committee; "Inductive Regulators Versus Synchronous Regulators for Distribution Circuits," by J. E. Woodbridge; "220,000-Kv. Apparatus," by H. Michener; report of prime movers committee; report of power-factor committee; "Kva. Demand Meters," by O. A. Knopp.

WEDNESDAY, JUNE 20

*Afternoon.*—Report of hydraulic power committee; "Water Hammer," by R. J. C. Wood; "Friction Tests on Penstocks," by R. A. Monroe; report of meter committee; report of underground committee; "Underground System of Southern California Edison Company," by N. B. Hinson; "35,000-Volt Cable Installation in Los Angeles," by M. O. Boiser.

THURSDAY, JUNE 21

*Morning.*—Report of safety rules committee; report of overhead-systems committee; "Operation at 220,000 Volts," by H. A. Barre; paper by W. J. Canada (subject not announced); report of inductive-co-ordination committee.

The Commercial Section will run parallel sessions with the Technical Section. The program for these has not been announced. On Thursday afternoon there will be a trip of inspection to the plant of the Pacific Coast Steel Company in South San Francisco. A trip to Mount Tamalpais on Saturday morning will conclude the convention.

## Entertainment Program of A. I. E. E. Swampscott Meeting

An elaborate program of entertainment and inspection trips has been prepared for the annual convention of the American Institute of Electrical Engineers, to be held at the New Ocean House, Swampscott, Mass., in the week beginning June 25. Besides sightseeing trips to Boston and to Lexington, Concord, Salem and Marblehead, all rich in historic interest, trips of inspection will be made each day to places of engineering and manufacturing note. Among these will be the River (Lynn) and West Lynn works of the General Electric Company, the L Street station, Beacon Street substation and service building of the Boston Edison company, Creighton's shoe factory at Lynn, the Naumkeag Mills at Salem, the Simplex Wire & Cable Company at Boston and the Arlington Mills at Lawrence. Arrangements for visits to Harvard University and the Massachusetts Institute of Technology have, of course, been made, and there will be ample provision for golf, tennis, bridge, dancing and concerts.

The technical program as printed in the ELECTRICAL WORLD for May 19, page 1165, has been confirmed without material change. It should have been stated that the paper on the new Weymouth station to be given on Wednesday morning is by I. E. Moultrop and J. Pope.

## Dr. Agnew Pleads for Greater Standardization

"The Industrial Significance of Standardization" was the subject of an address made recently by Dr. P. G. Agnew of the American Engineering Standards Committee at a luncheon of the Metric Association in New York. Dr. Agnew said:

"Standardization tends to stabilize production and employment, since it makes it safe for the manufacturer to accumulate stock during periods of slack orders, which he cannot safely do with an unstandardized product. Moreover, by simplifying the carrying of stocks it makes deliveries quicker and prices lower. It reduces selling costs, a fact which is generally overlooked.

"Unit costs to the public, too, are lowered in that mass production is possible, as has been so strikingly shown in the unification of incandescent lamps and automobiles. Standardization is increasingly important for the maintenance and development of foreign trade. There is strategy in nationally recognized 'American' specifications. And by concentration on essentials, and the consequent suppression of confusing elements intended merely for sales effect, it helps to base competition squarely upon efficiency in production and distribution and upon intrinsic merit of product.

"Another benefit of standardization is that it acts as a powerful stimulus to research and development and is also the principal means of getting the results of research into actual use in the industries. Moreover, it helps to eliminate practices which are merely the result of accident or tradition and which impede development.

"Finally, the joint effort in bringing about standardization within and between industries almost invariably leads to better understanding and to beneficial co-operation along other lines—a step toward the integration of our industries."

## Electrical Leaders to Address Canadian Association

Delegates from all parts of Canada and many from the United States will gather in Montreal on Thursday, June 21, for the thirty-third annual convention of the Canadian Electrical Association, which will continue until Saturday. Headquarters will be at the Mount Royal Hotel. Dr. M. Luckiesh of the Nela Research Laboratories, Cleveland, will give an illustrated lecture on the lighting of the home, and S. G. Hibben of the Westinghouse company will give a talk and demonstration on industrial lighting. President-elect Walter H. Johnson of the N. E. L. A. and H. M. Edwards, auditor of the New York Edison Company, are also expected to address the convention.

There will be two lunches, a dinner, a dance and an "electrical veterans' night." At Thursday's luncheon H. T. Davies, president of the association, will preside, and the speakers will be Jacques Bureau, M.P., and Mr. Johnson. At Friday's luncheon A. Monro Grier, president of the Canadian Niagara Power Company, will preside, and the speaker will be L. A. Hawkins, research laboratories, General Electric Company, Schenectady, who will take the place of Dr. C. P. Steinmetz. J. F. Gilchrist, Chicago, vice-president Commonwealth Edison Company, will be the chief speaker at the dinner on Thursday night. He will talk on the merchandising end of the electrical industry. A dance will follow the dinner. Friday night will be "electrical veterans' night." The usual full committee reports will be presented.

## Iowa Men Prepare Four-Day Program

Meeting at Mason City on June 26-29, the Iowa Section, N. E. L. A., will give the following program:

TUESDAY, JUNE 26

*Morning.*—President's report, C. N. Chubb; secretary-treasurer's report, M. G. Linn; Public Relations Section, F. J. Hanlon; Technical Section, C. A. Sears; Commercial Section, S. C. Dows; Accounting Section, H. Bellamy; membership committee, R. H. Fowler; rate committee, M. G. Linn.

*Afternoon.*—Inductive interference committee, Austin Burt, discussion by A. B. Campbell, J. M. Drabelle, C. G. Johnston and H. F. Boehner; rural-lines committee, A. W. Jones, discussion by V. L. Hein and E. L. Fischer; résumé of activities of national rural-lines committee, Arthur Huntington; "Recent Developments Regarding Rural-Lines Liability Insurance," W. S. Ferguson, discussion by W. A. Woodward; committee on taxation of transmission lines, R. H. Fowler.

WEDNESDAY, JUNE 27

*Morning.*—Address, Frank Hulswit; meter committee, S. M. Cox; "The Meter Instrument Calibration Laboratory at Iowa State College," F. D. Paine; "Sales and Service of Electric Ranges," H. D. Mitchell and V. O. Stafford; "Merchandising," H. L. Green, Waterloo.

*Afternoon.*—Automobile trip.

THURSDAY, JUNE 28

*Morning.*—Legislative committee, F. J. Hanlon; Iowa Committee on Public Utility Information, F. J. Hanlon and Joe Carmichael; address by a member of the Iowa Board of Railroad Commissioners; "Recent Decisions Affecting Fair Value, Depreciation and Rate of Return," John A. Reed; "Observations Regarding Increased Taxation of Public Utility Property," John A. Reed; "Model Power-Plant Design," C. L. Shoemaker; discussion by John M. Drabelle, O. W. Harrod, F. A. Beatty, Austin Burt and F. C. Chambers.

*Afternoon.*—Iowa Electric Railway Association meeting.

*Evening.*—Banquet.

FRIDAY, JUNE 29

*Morning.*—"Installation, Operation and Maintenance of Electric Distribution Transformers," C. R. Stahl, discussion by Charles Clark; "Public Utility Accounting," C. J. Anderson; "Customers' Accounts and Collections," George F. Myers and F. J. Larsh; election of officers.

There will be the usual entertainment features, dances and provisions for lake bathing.

## Consumers' Power Reports Prosperous Year

The net income of the Consumers' Power Company of Jackson, Mich. for 1922, after the payment of all charges, depreciation, interest on bonds and preferred dividends, was $3,307,388, or $21.06 a share on the $16,175,900 outstanding common stock of the company. This compares with a net income in 1921 of $2,494,044.

Business conditions, the annual report says, were much more favorable than in the previous year and brought greatly increased service demands upon the company. Electric sales increased 31,741,061 kw.-hr., or 17.57 per cent over 1921. Total electric sales for 1922 were 346,149,671 kw.-hr. to 149,124 customers. The company expended $3,784,445 for extensions, additions and improvements in 1922 and now has plans under way for the expenditure of another $10,000,000 during 1923 for improvements.

Items on the income report, comparing with those of 1921, follow:

| | 1922 | 1921 |
|---|---|---|
| Gross earnings ..... | $15,067,116 | $14,073,292 |
| Operating expense.. | 8,302,989 | 8,373,210 |
| Balance .......... | 3,307,388 | 2,494,044 |

# Brief News Notes

**Work on Boulder Lake Plant Started.**—Work on the twelve-million-dollar power plant to be erected by the Cities Service Company at Boulder Lake, Col., where a great artificial reservoir is to be made, was begun on June 1.

**Western New York Companies to Merge.**—Stockholders of the Genesee Light & Power Company, the Western New York Public Utilities Company and the Le Roy Hydraulic Gas & Electric Company have voted to merge, and the combined company will be known as the Western New York Public Utilities Company, Inc. The general offices will be in Batavia.

**Waukesha Company Absorbed.**—A long-talked-of transfer of the Waukesha Gas & Electric Company to the Wisconsin Gas & Electric Company, Racine, of which the Milwaukee Electric Railway & Light Company is also a subsidiary, is now completed. The first effects of the transfer will be a reduction of rates July 1 or earlier. There will be no change in the management.

**Virtually All Utah Coal Mines Electrified.**—A contract has been signed between the Utah Power & Light Company and the Utah Fuel Company whereby the former will furnish electric power to the principal mines of the fuel company in Carbon County, Utah. The signing of this contract marks the last step in the electrification by purchased hydro-electric power of virtually all the coal mines in Utah. The Utah Fuel Company formerly used its own steam-generated electric power.

**Sioux City to Have Electrical Show.**—An electrical exposition will be staged in Sioux City, Iowa, in the fall under the auspices of the Sioux City Electrical Club. Plans are being made to make it one of the best electrical shows ever held in the Middle West, according to C. C. Murphy, president of the club.

**Teaching Resuscitation Method to Police and Firemen.**—The illustration shows a practical demonstration given to city employees by Levi Bryant of the Dayton Power & Light Company of the prone-pressure method of resuscitation from electric shock, which is also

applied to those apparently asphyxiated or drowned. By arrangement with the Safety Director of Dayton Mr. Bryant, who is an expert in the use of this method, has conducted classes for the purpose of instructing policemen and firemen in its use.

**Duncan Riffle Plant Almost Complete.**—The eight-million-dollar hydro-electric power plant of the Alabama Power Company at Duncan Riffle, on the Coosa River, will be running at full capacity within sixty days, according to information given out. Two 30,000-hp. units are now going, a third one will be operating within thirty days, and at the end of two months the fourth and last one will start. Even with this additional 120,000 hp. the company will not be able to supply the demand for power.

**Pit River No. 3 Construction Starts.**—The Mount Shasta Power Corporation, the construction division of the Pacific Gas & Electric Company, has been authorized by the Railroad Commission of California to spend $12,312,600 on power development on the Pit River, to be known as Pit River No. 3. Construction work is already under way. The new plant involves the digging of a 19-ft. pressure tunnel 22,700 ft. long with a capacity of 3,000 sec.-ft. Three penstocks will deliver the water to the power house under a head of 313 ft., developing 108,000 hp.

**Louisville Waterside Plant Near Completion.**—The steel-skeleton framework of the addition to the Waterside station of the Louisville Gas & Electric Company is now so near completion that the 20,000-kw. turbine is expected to be placed in operation before fall. The total capacity of the plant will then be 67,800 kw. This new extension will include two boilers and allow room for a future turbine. The present rate of growth for the Louisville territory may be gaged from the 8,060 kw. in new power contracts secured during the first four months of this year as compared with 3,730 kw. during the same period in 1922.

**Southern Sierras Orders Largest Turbine of Type.**—The Southern Sierras Power Company has awarded a contract to the Pelton Water Wheel Company for furnishing a 14,000-hp. single-runner, single-nozzle impulse turbine. This unit will be installed at the power company's Leevening Creek plant No. 1 and will operate under an effective head ranging from 1,531 ft. to 1,622 ft. This, it is announced, will be the largest capacity single-runner impulse turbine in the United States.

**Marshall, Tex., Has New Central Station.**—The new central power station of the Marshall (Tex.) Electric Company was formally opened recently. The station was built to supply electrical energy for lighting and power purposes to Longview, Jefferson, Hallsville, Kilgore and Woodlawn. The plant and the distribution systems are owned by the American Public Service Company, an Insull property. The formal opening of the plant took the form of a community gathering to inspect the plant and see it in operation. The American Public Service Company has an investment of more than $2,000,000 in east Texas utilities.

**Alabama Power's Opelika Line.**—The Alabama Power Company is preparing to build a high-tension transmission line from the Coosa River power developments to Opelika at an approximate cost of more than $1,000,000, according to a recent announcement by Thomas W. Martin, president of the company. A primary substation similar to the largest one now in operation by the company and capable of great expansion will be built at Aubrey, on the outskirts of Opelika. At this station the power will be stepped down and transmitted over 44,000-volt lines from Opelika to Lafayette, Roanoke, Auburn, Notasulga Tuskegee, Waverly, Dadeville, Camp Hill and Alexander City.

**Philadelphia Electric Schools Merge.**—Announcement is made by Provost Penniman of the merger of the Moore School of Electrical Engineering—provided for in the will of Alfred F. Moore—and the School of Electrical Engineering at the University of Pennsylvania. The new school will be known as the Moore School of Electrical Engineering and will have the income from a fund of $1,500,000 left by Mr. Moore, in addition to the funds hitherto at the disposal of the university's electrical engineering department. It probably will be ready for operation next fall. Provost Penniman says that ample space and equipment for the new school are available in the Engineering Building of the university.

**Citizen-Aided Development Near Lebanon, Mo., Under Way.**—A 2,400-hp hydro-electric development of the Missouri Water Power Company on the Niangua River near Lebanon, Mo., is progressing rapidly, and as the capital for this development has to a great ex

...en supplied by citizens of Leb... that city is much interested in project. A dam is being built across the Niangua and a tunnel has been drilled through the rock to the level of the lower channel. The power house will be at the dam. The electric plant at Lebanon has already contracted for energy from this plant and poles have been erected between the dam and the city, a distance of 25 miles. An important result of this development will be the creation of a large lake in one of the best fishing districts in Missouri.

**Norway Plant in Operation.**—The first unit, rated at 2,300 kva., of the new hydro-electric plant of the Indiana Hydro-Electric Power Company at Norway was placed in operation the last of May. Within a short while three other units, also rated at 2,300 kva., will be placed upon the line. This company is a subsidiary of the Middle West Utilities Company and is operated as a unit of the Interstate Public Service Company of Indiana. Transmission lines will tie this plant in with the lines of the Indiana Service Corporation of Lafayette and the Interstate lines supplying power and light for the district surrounding Monticello. An additional transmission line has also been built from Norway to connect with the Central Illinois Public Service Company's lines at a point near the Indiana-Illinois border in the vicinity of Kentland.

**Municipal Plant Opposed in Logon, Utah.**—The Chamber of Commerce of Logan, Utah, in a special report recommends that the city abandon plans to build a new power plant and suggests instead that power be purchased wholesale from the Utah Power & Light Company under an existing contract which has several years to run. The report shows that $5,000 can be saved annually by purchasing power from the central station. A consulting engineer employed by the city to report on the advisability of erecting a new municipal hydro-electric plant estimates that the cost of the development would be approximately $266,000. The present municipal plant is supplying about 40 per cent of the city's requirements. One-half of the power retailed by the city is purchased from the Utah Power & Light Company at a very low rate under a long-term contract.

**Removable Dam Proposed for Snake River.**—A license propably will be granted by the Federal Power Commission to the Burbank (Wash.) Irrigation District to place a removable dam in Snake River during the low-water season. The district recently has constructed a power house, but the water supply during the period of minimum flow is insufficient to permit of its operation. The district is not in a position to finance a permanent dam at this time and represents that it is essential to irrigation that the needed diversion be permitted. The chief of engineers in his report expresses doubt as to the feasibility of putting in and taking out each year such a structure as is proposed. He sees no objection, however, to the plan provided the district puts up a bond to guarantee the removal of the obstruction when required. It is probable that the license will be limited to four or five years so as to give the district an opportunity to establish itself financially, at which time a permanent structure can be substituted.

**Foshay Buys Tri-State Utilities.**—Purchase of the control of the Tri-State Utilities Company by the W. B. Foshay Company of Minneapolis has been announced by Mr. Foshay. The general offices of the company, which operates electric light plants in Iowa, South Dakota and Nebraska, are to be moved to Minneapolis. The company is one which was started by Mr. Foshay in 1917 at Dallas and Winner, S. D. Illness forced him to sell two years later, and the present purchase is the realization of the plans delayed in 1917, he says. This company has total assets aggregating $1,102,607, has two water-power and four steam and Diesel plants and 250 miles of transmission lines. It serves a population of 26,000 persons. A transmission line to connect Nebraska and South Dakota cities with those of the Minnesota electrical distributing company in the southeastern part of the state will be built. The combined companies serve eighty-four cities and have more than 1,100 miles of transmission lines. The total value is estimated at $1,942,000.

# Associations and Societies

**San Francisco Section, A. I. E. E.**—The annual meeting of the San Francisco Section, A. I. E. E., was held May 25. J. H. Anderton, consulting engineer of San Francisco, spoke on "Some Hydro-Electric Developments of Japan" and showed four reels of motion pictures.

**Utah Engineers Elect Officers.**—At the annual banquet of the Utah Society of Engineers on May 26 the following officers were declared elected: President, Hugh C. Lewis; vice-president, Ernest Gayford; secretary, J. A. Hale; treasurer, R. K. Brown; member of the executive committee, L. D. Anderson. The society has a membership of two hundred.

**Newark Has I. E. S. Chapter.**—A chapter of the Illuminating Engineering Society has been formed at Newark, N. J., of which William T. Blackwell is chairman and H. C. Calahan is secretary. A meeting in conjunction with the Newark Master Electricians' Association was held on Monday of this week, when S. G. Hibben spoke on "Practical Electric Lighting."

**Electrical Manufacturers' Agents' Association.**—At a meeting held in New York on June 5 the Electrical Manufacturers' Agents' Association was brought into being. The officers elected were: President, W. S. Brown of the W. S. Brown Company; treasurer, C. W. Boynton of the Electric Products Company; secretary, E. S. White of the Corey Company. The three officers were designated as representatives to the board of governors of the Electrical Board of Trade.

**Utah Section, A. I. E. E.**—At the last meeting of this section for the season, held on May 31 in the Terminal substation of the Utah Power & Light Company, a resolution was passed favoring a proposed extension of the activities of the Engineering Council of Utah by employing a secretary who will devote his entire time to engineering society affairs. These section officers were elected: Chairman, C. R. Higson; secretary-treasurer, Hiram W. Clark.

**Empire State Gas and Electric Association.**—A meeting of the Commercial Section of this association will be held at Briarcliff Lodge, Briarcliff Manor, N. Y., on June 28 and 29. On the first day purchasing and storeroom matters, the merchandising of service, of appliances and of street lighting, street-lighting development, advertising appliances, advertising service, advertising good will, and public relations will be discussed. On the second day the topics will be "Investigation of Service Inquiries and Routine," "Rural Service," "Industrial Engineering," commercial, factory and domestic; "Refrigeration," "Commercial Department Accounting" and "Service of the Utility Company from the Viewpoint of an Outsider."

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

North Central Division, N. E. L. A.—Minneapolis, June 20-22. H. E. Young, Minneapolis General Electric Company.

Society for the Promotion of Engineering Education—Ithaca, N. Y., June 20-22. F. L. Bishop, University of Pittsburgh.

Canadian Electrical Association — Montreal, June 21-23. Louis Kon, 65 McGill College Ave., Montreal.

Southern Appalachian Water Power Conference — Asheville, N. C., June 25-27. J. A. Switzer, Knoxville, Tenn.

American Institute of Electrical Engineers —Annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

American Society for Testing Materials—Atlantic City, June 25-29.

Iowa Section, N. E. L. A. — Mason City, June 26-29. M. A. Linn, Des Moines Electric Co., Des Moines.

Associated Manufacturers of Electrical Supplies—New London, Conn., June 26-29. Frederic Nicholas, 30 East 42d St., New York.

National Council Lighting Fixture Manufacturers—Buffalo, June 26-28. C. H. Hofrichter, 233 Gordon Square Bldg., Cleveland.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association — Cedar Point, July 10-13. D. L. Gaskill, Greenville.

New England Division, N. E. L. A.—Swampscott, Mass., Sept. 6-8. Miss O. A. Bursiel, 149 Tremont St., Boston.

Michigan Electric Light Association—Grand Rapids, Sept. 11-13. Herbert Silvester, Detroit Edison Co., Ann Arbor.

Rocky Mountain Division, N. E. L. A.—Glenwood Springs, Col., Sept. 17-19. O. A. Weller, 900 15th St., Denver.

Association of Iron and Steel Electrical Engineers — Buffalo, Sept. 24-28. J. F. Kelly, 513 Empire Bldg., Pittsburgh.

# Recent Court Decisions

**Suit Brought on Ground of Confiscation Where Rates Have Not Been Put Into Effect Is Premature.**—The United States Supreme Court on June 4 affirmed the action of the District Court in dismissing a suit brought by the Brush Electric Company against the city of Galveston, Tex., to enjoin a reduction in rates. The company supplies light and power in Galveston under a franchise granting the city authorities power to regulate rates. In 1918 an ordinance was adopted increasing rates. In 1919 another ordinance sought to reduce the rates made effective in 1918. The company sued to test both ordinances, alleging that the 1919 rates were so low as to be confiscatory. A special master made a report on valuation to which both sides excepted. The District Court changed the master's report and then entered an order dismissing the suit on the ground that, inasmuch as the 1919 ordinance rates had not been put into effect and estimates of probable income under its rates were based on business volume several years before, it could not be determined whether the rates were confiscatory or not.

**Allowance of Element of Going Value Proper, Though Business Had Been Operating at a Loss.**—Reversing an order of the lower court which set aside rates fixed by the Missouri Public Service Commission for steam heat supplied by the Kansas City Light & Power Company (State ex rel. Case vs. Commission), the Supreme Court of Missouri held that because the business of the company in furnishing steam heat had been conducted at a loss for three successive years owing to the great increase in the cost of fuel, labor and material during those years an allowance by the Public Service Commission of "going-value" or intangible value of the plant as a going concern was not therefore unlawful, where there was no evidence that the business when on a normal basis had not been a feasible or practicable business and no showing that the demand for the commodity furnished had in any manner decreased. Allocating and apportioning the valuation and operating expenses of the plant on the basis of 85 per cent chargeable to steam heat and 15 per cent to electricity was proper under evidence showing the primary use of the plant concerned to be for the furnishing of heat, and that to use the plant for producing electricity only would make the expense of the electrical energy prohibitive and the operation of the plant unprofitable. The court further held that a finding of the commission as to the value of the property of the company was not void for failure to itemize or separately state the "going-concern" or "intangible" value of the plant, where no evidence was introduced to show such value separately from the physical value of the plant. (249 S. W. 955.)*

**Exchange of Sales Information and Quotations Through Outside Agency Forbidden.**—Manufacturers in the same industry cannot exchange information as to sales and prices virtually as a unit controlling the business of the industry without coming into conflict with the Sherman law, even though the information be cleared and distributed by an independent agency, the United States Supreme Court held in its decision reversing the action of the District Court for Northern Illinois in holding for the defendants in the government's suit against the American Linseed Oil Company and eleven other manufacturers and the Armstrong Bureau of Related Industries. The opinion directed the District Court to grant the government the injunction it had sought. The twelve linseed-oil manufacturers were subscribers to the Armstrong bureau. They are alleged to have controlled a large part of the business of their industry. They agreed to turn over to the bureau full reports of sales, quotations, offerings and other information. They were to receive through the bureau data on the market, trade and manufacturing conditions in the industry and on economies in manufacture and salè, information regarding credit of buyers, uniform cost accounting systems, fair freight rates, standardization of products and other matters.

**California Commission Sustained in Southern California Edison Case.**—The California Supreme Court has sustained the action of the Railroad Commission in ordering a reduction of 10 per cent in the rates of the Southern California Edison Company and in refusing to open the proceedings involving the 10 per cent rate reduction to include a general rate investigation. Sidney E. Saunby, C. A. Melcher and the California Farm Bureau Federation had contended that the order of the commission was unlawful in so far as it operated to continue in effect the former order of the commission as to the amount of taxes to be estimated and allowed the corporation as operating expenses and also as to the allowance of any portion of the sum paid by the corporation as United States income taxes as operating expenses. The commission in its order denying a petition for rehearing had set forth its reason as follows: "Case No. 1710 was in the nature of an emergency proceeding and limited in its scope in order that certain reductions in rates might be made effective immediately. This course was agreed to in general by attorneys in the proceeding and was taken with the specific understanding that the commission would, on its own motion, institute a further proceeding to investigate fully the rates, rules and practices of the Southern California Edison Company. Pursuant thereto the commission has instituted a proceeding into the entire question of the reasonableness of the rates, rules and practices of the Southern California Edison Company (Case 1759), and in view of this fact and the limitations of the scope of Case No. 1710 it does not appear that there is any justification for granting a rehearing on the grounds set forth in the petition herein."

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Companies Must Stand by Representations of Authorized Employee.**—The Wisconsin Railroad Commission has ordered the Burkhardt Milling & Electric Power Company to discontinue a standby or demand charge made to a creamery association during months of the year when the association's motor was out of service. The commission found that the power company's interpretation of the rates was correct, but that it had been wrongly interpreted to the customer by the employee who solicited the business and that the company must stand by the oral statements of its authorized representative despite the fact that to do so involved a slight degree of discrimination.

**Exchange Value Different from Condemnation Value.**—In the case of the Pacific Gas & Electric Company, which desired to exchange certain properties with an affiliated company to eliminate duplication and competition, the California Railroad Commission approved a value which represented the historical cost of the property less the reasonable depreciation accrued in the case of each company in the normal operation of its business. The facts that both parties were public utilities whose rates were subject to regulation and that the existing duplication would result in the taking down of certain lines, thus reducing them to a salvage value, were those on which the commission based its ruling.

**Rates for Electric Cooking.**—In substituting for a minimum charge plus an energy charge a monthly service charge plus an energy charge in the electric cooking rates of the Sauk City municipal plant, the Wisconsin Railroad Commission said: "While it is desirable to offer as low a rate as is consistent with the cost of service for furnishing energy for cooking purposes, it must be borne in mind that, especially in small communities, the fixed charges involved in furnishing this service are quite material. Oftentimes special transformers have to be provided for cooking installations; heavier secondaries are required, together with special metering equipment. These cause a substantial burden of fixed costs in connection with this service which may properly be met by a service charge corresponding to the very generally accepted practice with reference to power rates."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

### S. B. Irelan Leaves Montgomery

S. B. Irelan, vice-president and general manager of the Montgomery (Ala.) Light & Water Power Company, has been appointed vice-president and manager of the St. Joseph (Mo.) Railway, Light, Heat & Power Company, succeeding B. C. Adams, who, as was announced in the June 9 issue of the Electrical World, goes to Toledo. Mr. Irelan has been in Montgomery since 1919, when he was transferred from Sedalia, Mo., where he was vice-president and general manager of the City Light & Water Company. He became identified with the Doherty interests following his graduation from Purdue University, when he enrolled in the engineering school of Mr. Doherty at Denver. In 1910 he was made secretary and treasurer of the Fremont (Neb.) Gas & Electric Light Company, a Doherty property, and two years later was transferred to the engineering department of Henry L. Doherty & Company in New York. Subsequently he was vice-president and general manager of the Bartlesville (Okla.) Gas & Electric Light Company, going from there to Sedalia.

**J. H. Shearer**, general superintendent of the Penn Central Light & Power Company, has received the title of vice-president.

**C. O. Culver**, general superintendent of the Eastern Shore Gas & Electric Company, with offices at Salisbury, Md., has been made general manager of the company.

**Geoffrey T. Cooper**, who was formerly with the Narragansett Electric Lighting Company of Providence, R. I., is now associated with Stone & Webster, Inc., Boston, as electrical designer.

**L. E. Perry**, formerly superintendent of the East Aurora (N. Y.) Electric Light Company, is now associated as engineer with the Charles M. Kelso Company, Inc., contracting engineers, at Utica, N. Y.

**Harold F. Rice**, formerly associated with the General Electric Company, Schenectady, N. Y., is now in the electrical engineering department of the Denver (Col.) Gas & Electric Light Company.

**C. R. Higson**, assistant to the general superintendent of the Utah Power & Light Company at Salt Lake City, has been elected chairman of the Utah Section of the American Institute of Electrical Engineers. Mr. Higson has been identified with public utilities in Utah since 1911, when he joined the Utah Light & Railway Company at Salt Lake City. The following year, when the Utah Power & Light Company was organized, he entered its engineering and operating department. He is a native of Salt Lake City and a graduate of the University of Wisconsin.

### Britton Elected First Vice-President of N. E. L. A.

John A. Britton, vice-president and general manager of the Pacific Gas & Electric Company, was elected first vice-president of the National Electric Light Association at the convention of the association held last week in New York City. For a number of years Mr. Britton has been an influential factor in association activities, and he is known

J. A. Britton

throughout the country for his contributions as executive-engineer to the building of Pacific Coast utilities. Although born in the East in 1855, he has been associated with California since his thirteenth year. In 1874 he became associated with the Oakland (Cal.) Gas Light Company, steadily advancing to the position of president, and in 1903, when the company sold out to the California Gas & Electric Corporation, he was retained as chief executive of the new organization. It was in 1907 that Mr. Britton was made vice-president and general manager of the Pacific Gas & Electric Company, into which the California Gas & Electric Corporation had been merged. In this capacity he has had charge of all construction work and been responsible for the operating and financial policies of the company, and the success with which he has shouldered these herculean tasks has made him an outstanding figure among the leaders of the industry. Mr. Britton is a regent of the University of California, president of the Bohemian Club of California and a member of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers.

**David B. Rushmore**, consulting engineer of the General Electric Company, has received the degree of D.S. from his alma mater, Swarthmore College.

**Gerard Swope**, president of the General Electric Company, was awarded the honorary degree of doctor of science by Rutgers College, at New Brunswick, N. J., on Tuesday, June 12.

**W. A. Carter** of the research department of the Detroit Edison Company spent the latter part of this week in New York City on business for his firm.

**Dr. Irving Langmuir**, assistant director of the research laboratory of the General Electric Company, has received the honorary degree of doctor of science from Union College, Schenectady, N. Y.

**Owen D. Young**, chairman of the board of directors of the General Electric Company, was given the degree of doctor of literature by St. Lawrence University, Canton, N. Y., of which he is an alumnus, on Tuesday, June 12.

**E. N. Willis**, secretary of the Southwestern Public Service Association, attended the National Electric Light Association convention held last week in New York and reported prosperous conditions for the utilities in his section, although the climatic conditions just now are not very favorable for the agricultural interests.

**C. E. Keller**, who has been with the General Electric Company since 1921, has joined the research department of the West Penn system at Pittsburgh.

**W. S. Vivian** has been chosen to direct the public relations work of the properties of the Middle West Utilities Company, with headquarters in Chicago. Mr. Vivian has long been engaged in this work with the telephone industry.

**E. A. Olsen**, superintendent of electric operation of the Alexandria (Va.) Light & Power Company, has been placed in charge of field construction in connection with the building of a 45,000-volt line between Albany, Tifton and Valdosta, Ga., part of which will be for the South Georgia Public Service Company and part for the Valdosta Lighting Company.

**N. Saitoh**, director of the Daido Electric Power Company, Ltd., one of the largest companies of its kind in the Japanese Empire, recently inspected the works of the Westinghouse Electric & Manufacturing Company at East Pittsburgh, where a large part of the electrical apparatus used by the Daido company has been built. The visitor from the Orient was accompanied on his tour of the plant by H. F. Griffith, assistant to general manager of the Westinghouse Electric International Company, and Stephen Q. Hayes, general engineer of the Westinghouse company, who has been working with the Daido Electric Power Company in the extensions of its systems.

**W. B. Lewis**, formerly in the sales department of the San Francisco office of the Western Electric Company, is now in the Los Angeles office of that organization.

**Hoyt Catlin**, advertising manager of the Bryant Electric Company, Bridgeport, Conn., was elected president of the Bridgeport Advertising Club at its annual dinner on May 28.

**C. H. Dahl**, for the last three years statistician of the Winnipeg Electric Railway Company, has been advanced to be one of the assistants to the vice-president, A. W. McLimont.

**Richard J. Johnston**, formerly with the Navy Department at Washington, has been appointed illuminating engineer of the George Cutter Company, South Bend, Ind.

**A. M. Jackson**, Rocky Mountain district representative of the Locke Insulator Company, with headquarters in Salt Lake City, has been transferred to the Chicago office of the company.

**Guy Zinck**, formerly with the Westinghouse Electric & Manufacturing Company at East Pittsburgh, Pa., is now in the industrial sales department of the Los Angeles office of that company.

**W. G. Keay**, for the past four years with the Ruud Manufacturing Company, with headquarters at Detroit, has been appointed New England manager of the Eureka Vacuum Cleaner Company, with headquarters at Boston.

**J. C. Jones** of the Los Angeles office of the Westinghouse Electric & Manufacturing Company has been made manager of the central-station division in that territory and will also have charge of the sale of supply apparatus.

**O. M. Bostwick**, for ten years in charge of the advertising division of the Sprague Electric Works of the General Electric Company, is now in charge of the New York office of the advertising department of the General Electric Company.

**W. W. Smith**, electrical and pyrometric engineer with the Chemical Warfare Service, Edgewood Arsenal, Edgewood, Md., has resigned to enter the fan-motor department of the General Electric Company, Pittsfield, Mass., as an electrical engineer.

**B. F. McIntyre** has been appointed branch manager of the Cleveland sales office of the Industrial Controller Company, Milwaukee. Mr. McIntyre was formerly connected with the Canadian branch of the Robbins & Myers Company.

**Carl Whitmore**, formerly division superintendent of plants at Portland, Ore., of the Pacific Telephone & Telegraph Company, is now division superintendent of installations of the Western Electric Company, with headquarters in San Francisco.

**W. P. Jend** has been appointed manager of the merchandising division of the Detroit office of the Westinghouse Electric & Manufacturing Company to succeed F. D. Koebel, who will take up general duties in connection with both the central-station division and the merchandising division.

**H. R. Sargent**, formerly manager of the wiring supplies division of the Bridgeport works of the General Electric Company, has been appointed managing engineer of that division under a development plan which will create several unit divisions at the Bridgeport factory.

**R. K. Evans**, sales engineer with the Remy Electric Company, Anderson, Ind., has been appointed service manager of the company to fill the vacancy created by the resignation of E. E. Eby. Mr. Eby severed his connection with the Remy company to join the sales staff of the Wyatt Roller Bearing Company, Newark, N. J.

**William J. Wooldridge**, manager of the electrical sheet department of the Wheeling Steel Corporation and of its predecessor, the Whitaker-Glessner Company, for almost four years, in charge of manufacture and sales of electrical sheets, recently resigned. Mr. Wooldridge has not announced his future plans.

**C. I. Weaver**, vice-president and general manager of the Springfield (Ohio) Light, Heat & Power Company, has become fiscal agent for the American Gas & Electric Company in the operation of properties recently acquired in Urbana, Mechanicsburg, Mutual, Catawba, Cable and Woodstock, Ohio, from the Northwestern Ohio Light Company, southern division.

**S. S. Sonneborn** has joined the organization of the Splitdorf Electrical Company, with headquarters at the company's factory at Newark, N. J. Mr. Sonneborn was for many years general manager of the Electrose Manufacturing Company and is an expert in the molded and insulation parts field. In his new position he will take charge and supervision of molded parts of shellac, rubber and synthetic compositions.

**Joseph G. Worker**, combustion and stoker engineer, has joined the organization of the American Engineering Company, Philadelphia, manufacturer of the Taylor mechanical stoker. Mr. Worker is secretary of the Stoker Manufacturers' Association of the United States and has spent many years in the study of coal burning by mechanical methods and processes.

**J. O. Case**, formerly local sales manager of the Los Angeles office of the General Electric Company, has recently been appointed assistant local manager of that office. Mr. Case has been associated with the company since 1905, when he went to Schenectady to take the student's apprentice course. He was local sales manager at Los Angeles for two years prior to his present appointment.

**Major R. W. Chandler**, formerly in charge of research work for the Yale & Towne Manufacturing Company, Stamford, Conn., has been placed in charge of industrial electric truck and tractor sales, with headquarters at the factory. J. C. Morgan, formerly sales manager of the industrial truck division, has been made manager of the hoist department, with headquarters at Stamford.

**Parker M. Robinson**, formerly turbine engineer on the Pacific Coast for the Westinghouse Electric & Manufacturing Company, has recently joined Hunt, Mirk & Company, consulting and contracting engineers of San Francisco, entering the firm as a junior partner. Mr. Robinson has been connected with the engineering department of the Westinghouse Electric & Manufacturing Company for more than four and a half years.

**H. G. Bonner**, manager of the Meridian (Miss.) Light & Railway Company, a Doherty property, will leave on July 1 to assume charge of the Ohio Public Service Company, Alliance, Ohio, also part of the Doherty organization. Mr. Bonner became identified with the Doherty interests in 1913, when he became new-business manager of the electric utility in Elyria, Ohio, owned by Henry L. Doherty & Company. W. R. Phipps, who was for a number of years general manager of the Brush Electric Company of Galveston, Tex., and a well-known man in the Doherty service, will succeed Mr. Bonner in Meridian.

**John R. Smith**, formerly estimating engineer with the Freeman-Sweet Company, electrical contractor of Chicago, has been made vice-president and general manager of the recently organized Electrical Industrial Sales Company, Chicago. Mr. Smith was at one time estimating engineer with the Beaver Electric Company at Chicago and was largely instrumental in forming the Electrical Estimator Association in that city, of which he served as secretary in 1918 and president in 1920. The new organization with which Mr. Smith has allied himself is to serve as manufacturers' agents.

# Obituary

**Robert B. Weaver**, owner of the Weaver Electric Company of Denver, Col., died recently of blood poisoning. Mr. Weaver, who was a native of Cuthbert, Ga., went West about twelve years ago. He was thirty-two years old.

**Capt. Alexander B. Guigon** of Richmond, Va., died recently at his home in that city at the age of sixty-five. Captain Guigon, who had been identified with the traction business in Virginia for more than thirty years, was prominent in the merger of the Richmond Traction Company with the Virginia Railway & Power Company and at the time of his death was general counsel for the company.

**Dr. Rudolph Hering**, engineer, died on Wednesday, May 30, at his home in New York. Dr. Hering was formerly a member of the firm of Herring & Fuller, consulting engineers to the New York Department of Water Supply, Gas and Electricity, and had directed the installation of various waterworks and sewerage system in the United States, Canada and South America. He was seventy-six years of age.

## Sentiment for Simplification Spreading

### Electrical Manufacturers and Jobbers Indorse the Movement to Eliminate Excess Varieties and Reduce Stock in Supply Lines

THE electrical industry is becoming exceedingly interested in the problem of simplification. Since the Federated American Engineering Societies, at the instigation of Herbert Hoover, Secretary of Commerce, made its survey of industrial efficiency in America, published under the title "Waste in Industry," a great deal of progress has been made in many industries. But electrical men have lagged behind. There is a very wasteful degree of duplication in electrical supply lines, a vast number of obsolete and other excess varieties, because the building up of greater lines through the creation of new types and sizes has been traditional among electrical manufacturers.

Finally the jobbers took the initiative at the recent meeting of their association, at which they listened to an address by W. A. Durgin, chief of the Division of Simplified Practice of the Department of Commerce, himself an electrical man. An urgent appeal was made to the Associated Manufacturers of Electrical Supplies to invite Mr. Durgin to the meeting of that association to be held this month at New London so that something of the same background may be given to the manufacturers also. A committee was appointed to confer with the manufacturers and with Secretary Hoover in the effort to work out a progressive program of simplification which may offer an immediate measure of relief.

The following quotations from letters recently received indicate the unanimity of sentiment:

THE action of the Electrical Supply Jobbers' Association at its recent meeting in Hot Springs, Va., in making definite recommendations for the simplification of various electrical supply lines has led to much discussion. Sentiment in favor of simplification as a matter of principle is almost universal. Difference of opinion lies mainly in the matter of application to the individual line, and here each manufacturer is apt to feel a little hesitancy for fear business will be lost by the dropping of numbers that are selling even in small quantity, although there may be other things and more popular devices available that practically duplicate them.

The accompanying quotations are taken from a large number of letters commenting on the general situation and indicate how universal the belief is becoming that "something should be done" to simplify the electrical supply line.

*By a Wiring-Device Manufacturer.*—Every time we issue a new catalog we eliminate a number of items which have become obsolete or on which the sales are so small as to not justify their being cataloged any longer. By agreeing with competitors, which I believe is not legal, more could be done, but I am not so sure that it would be of much benefit except to ourselves and possibly the jobber. The public would not be so well served.

On surface switches we make an open base a closed base, plain and indicating. Now, as far as breaking the current is concerned, one of those would be all that would be necessary. There are different uses, however, for each of the four kinds and all four kinds sell in reasonable quantities. Obviously, though, it would be an advantage to us to manufacture just one of the four, and for the jobber to carry but one of the four. As you undoubtedly know, we could not exactly do that, because the public would demand the other three and buy them from some one else.

We believe the agitation good and are co-operating and mean to co-operate along the lines suggested.

*By a Tool Manufacturer.*—We have been alarmed at the steadily rising price of labor, material and the products of manufacture. When we remember the distressing effect that followed the rapid rise in all commodities after the war and the collapse in business which followed, from which we are only just recovering, the present condition makes us apprehensive, and it is no doubt causing anxiety and possibly fear in the minds of business men everywhere.

We have given and are giving a great deal of consideration to labor-saving devices and ways and means of reducing costs of production which would enable us to place our line in the hands of the jobber, dealer and user at the lowest possible cost to them.

With this end in view, we have been considering the advisability of reducing the variety or styles of tools made by us, standardizing on those that are most popular and valuable to the trade, and diverting all of the business to them, in this way getting the benefit of quantity production.

We believe that this would result to the advantage of the jobber, dealer, user and ourselves and would surely enable us to reduce the present price on the tools we continue making, whereas under present conditions an advance in price would be absolutely necessary.

*By a Conduit Manufacturer.*—We are eliminating superfluous or excess varieties of fittings and have been doing it for some time. This, of course, would not apply to many of our leading lines, such as rigid conduit armored conductors, non-metallic flexible conduit, rubber-covered wire, brackets, etc., but it does apply to outlet boxes and such fittings, and we heartily agree with the principle at issue that manufacturers should take the initiative in eliminating excess varieties to the fullest extent possible.

We have noted a recent article advocating the elimination of enameled conduit and stating that zinc-treated conduit should answer all purposes as being a better product. In a general way there may be a good deal of truth in this statement, but, as a matter of fact, there are many places where conduit is installed which require an enamel protection—places where the surrounding conditions would readily corrode a zinc-treated conduit.

We merely mention this condition to indicate that on a program of elimination of excess varieties those not thoroughly posted might think that elimination could take place in some lines where conditions would make it impracticble or inadvisable.

*By a Wiring-Device Manufacturer.*—We are and have been strongly opposed to the multiplicity of articles in our line which are not really essential; in fact, the new catalog on which we are working will eliminate a few articles, thus further simplifying our line, and those articles which will be added are for purposes which do not duplicate except in so far as the rulings in some cities—for instance, Chicago—may require.

The only way in which manufacturing costs can be cut down to the minimum is to simplify the line as much as possible, and this, of course, means the elimination of all articles which are really duplicates of others serving practically the same purpose.

Of course as matters stand, the only thing that we can do is to use our best efforts in connection with our own line and in selling our product to induce our customers as far as possible to use standard material, and we believe that if all manufacturers will work with this idea in mind the problem to which you refer will in a large measure be solved in the not far distant future.

*By a Heating Appliance Manufacturer.*—We believe in the importance of standardization and simplification of lines as far as possible. In January, 1920, we had 477 cataloged items in the line. On Jan. 1, 1923, we had 206. This was accomplished by eliminating the manufacture of the same appliances under more than one trade name and by eliminating the sizes of product for which there was little demand. Actual standardization was greater than the figures show, as during this period new items performing new functions or improved functions were added.

In all of our newer product the question of standardization of parts or interchangeability of parts, as, for example, range-heating units or radiant-heater units, has been carefully watched, so that simplification has been carried further than is indicated by the number of cataloged items. This is an aid not only to the manufacturer but also to the entire trade, as it reduces the stocks of repair parts to be ordered or carried by our customers.

*By a Wiring-Device Manufacturer.*—We are in entire sympathy with the simplification idea. In the next reprint of our wiring-device catalog we will eliminate a number of existing devices, all of which are slow movers and were probably added originally to meet apparent competition.

We feel that almost every line is allowed to expand without due consideration of the necessity for various devices. We know as a matter of fact that this is true of many of our controller devices. This matter is constantly receiving consideration even on this line of apparatus, and we are continually removing devices from our standard catalog lines and putting these in semi-standard form in the hands of our engineers to meet special needs.

We feel that anything which the trade papers can do to bring continual pressure on the manufacturers to eliminate unnecessary devices is in the end going to reduce manufacturing costs and simplify the general distribution problem. Pride undoubtedly causes many manufacturers to expand their lines unnecessarily thus putting in the hands of the trade extensive catalogs which, at least from the appearance standpoint, will "stack up" with the catalogs of their competitors. This is economically wrong, and we believe the movement is now progressing in the right direction.

*By a Jobber.*—Owing to the existence of too many manufacturers' styles, if purchasing is not done with the greatest care and judgment today a jobber will find at least 25 per cent of his stock very slow-moving and eventually a great part of the 25 per cent will become dead. In other words, a jobber carrying a stock of $100,000 will actively operate on 70 to 75 per cent of this merchandise. Two years ago we decided on a policy of limitation and elimination of slow movers, but it has been a very hard job to get rid of these slow movers.

I am very glad, indeed, that the manufacturers are coming to an understanding as to excess varieties of goods, for in helping themselves they can certainly help the jobber by reducing his and their investment.

I believe that switch boxes could be simplified. Our purchases at the present time are limited to four styles which take care of more than 90 per cent of our requirements.

As regards pole-line hardware I am of the opinion that 50 per cent of the styles commonly manufactured could be eliminated without working a hardship.

There is another line that few jobbers have been successful in marketing, and that is fixtures. In twenty-two years I have been in and out of it four times and at the end of each discontinuation have found that the leftovers equaled or exceeded the profit which we had made or thought we had made, and it is all caused by manufacturers changing the styles. I have often remarked that the style of lighting fixtures changed about as often as the styles of women's hats.

*By Another Jobber.*—Every jobber and manufacturer in the electrical industry should be glad to help remedy the very poor conditions existing in our business because of the many duplicates and obsolete items manufactured and listed

We feel that conduit-box and porcelain-insulator lines are particularly burdened with obsolete and excess varieties. But it is our firm belief that results of great worth could be accomplished if the manufacturers can be induced to co-operate.

We have felt the burden of listing obsolete and excess varieties in our 800-page catalog, and to help us overcome the difficulties encountered have listed in our salesmen's price books only the catalog numbers which we carry in stock so our salesmen are able to tell their customers whether we have what they want, and the chances are that if we do not list the number called for, they help the customer pick out something we have in stock which will answer his purpose as well This saves time for the customer and ourselves in each department as well as for the ultimate purchaser, who is waiting to have his job finished in a hurry.

*By Another Jobber.*—To my mind the simplification of lines is absolutely essential to the future prosperity of the electrical jobbing business. I am convinced that we probably shall never again enjoy the same margins of profit on merchandise that we have enjoyed in the past; therefore, if we are to do our part in the proposed scheme of reducing the costs of distribution, the reduction of variety and simplifying of lines is necessary to enable us to secure a proper turnover.

It appears impossible, at least for the present, for the electrical jobber to reduce his overhead. A recent analysis of our operating expenses developed the fact that our payroll for the year 1922 was 43⅜ of the total operating expenses. For the first three months of this year it has increased to 47¾ per cent and this does not include the salaries of the executives. Our case is not exceptional by any means, for I find in making a comparison with others that their payrolls exceed 50 per cent of the total expenses.

I think we jobbers at least are all agreed that we are suffering from too great variety in almost every article we handle. The question is who is to do the job. The jobbers of this country have received little support from the manufacturers.

*By Another Jobber.*—I had occasion as far back as 1910 to get into this subject actively in connection with lightning arresters for low-voltage distributing systems, and the reduction in numbers and types not only saved every one concerned a considerable amount of money but also made the sales exploitation of this line much more accurate and intensive.

I should say that line hardware, conduit fittings, lamps or fuses would all give plenty of field for study in the elimination of excess numbers.

We have simplified our business by eliminating duplicate lines, and we are making it a practice to put nothing in the catalogs of our salesmen except what we think they should sell. We should be greatly assisted in our efforts, of course, if manufacturers would discontinue illustrating things that people do not really need but may think they require.

*By Another Jobber.*—With the co-operation of the manufacturers and the simplifying of their lines, the jobbers would release from frozen stocks many thousands and thousands of dollars that should be reinvested in lively fast-moving commodities that would permit the jobber to carry a better stock, to represent the manufacturers better and to serve the consumers better. If the executives would get into this proposition personally themselves, instead of delegating it to one of their understudies, they would marvel at their ignorance and would be amazed at the duplications that would be discovered in the lines they are carrying and at the duplication and obsolesence that creep into their stocks of merchandise at all times.

## Eleven Organizations Aid in Standardization Work

AID of eleven business organizations in the furtherance of the Commerce Department plan for the formulation of purchase standards specifications was pledged on June 11 at a conference of representatives of these bodies with Secretary Hoover at Washington.

Addressing the representatives of the organizations, who are to compose an advisory committee, Mr. Hoover declared it was the idea of the department to make a beginning of the scheme of standardizing purchase specifications by adopting definitions covering all federal government purchases, which would include between 2,500 and 5,000 articles. The scheme, he said, would be broadened to include state and municipal government purchases and public institutions.

Mr. Hoover emphasized that commercial interests would not be required to accept the standards adopted for general use, but was of the opinion that commercial practices would follow the government lead.

The organizations represented at the conference were the American Engineering Standards Committee, the American Society for Testing Materials, the National Association of Purchasing Agents, the American Hotel Association, the United States Chamber of Commerce, the National Association of Manufacturers, the National Business Editors' Association, the Federal Specifications Bureau, the Association for Government Service, the American Electric Railway Association and the Society of Automotive Engineers.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

MORE price decreases in the wiring lines are noted in this week's reports. Despite a slightly stronger copper market last week, prices of flexible armored conductor have fallen 10 per cent. Brass and bronze products for electrical manufacture generally are firm and are subject to the normal demand.

Added use of rubber composition products in the wiring-device line in preference to porcelain specialties is causing some concern among the smaller makers as regards stocks. The latter say stocks of this effective product are noticeably lower, and higher manufacturing costs are feared. However, some leading authorities in the wiring-device field say these fears by the smaller makers have no real foundation and that when purchasers of their different lines have come to accept more composition products in place of porcelain they will manufacture this composition for their own needs and will keep out of the open market.

Business of the electrical industry throughout the United States is continuing at the steady gait of the last three weeks, with normal stocks and slightly lower prices.

## Aspects of Electrical Machinery Exportation

UNBUSINESSLIKE methods as a means of securing profitable orders abroad should be unnecessary, according to opinions advanced at an electrical machinery conference held recently in Boston in connection with the New England foreign trade convention. In an informal discussion of present conditions in exporting it was brought out that in the sale of American electrical machinery overseas deferred payments by the foreign buyer ought not to be inevitable. Such equipment represents a substantial capital investment as compared with ordinary merchandise like haberdashery.

South America is growing fast in inquiries for electrical instruments for the automotive industry. At present, in the machinery field, the competition of Great Britain is acute in textile lines, and through co-ordination of interests British manufacturers are taking machinery business in some cases at very low profits or at actual losses. It was pointed out at this conference that American manufacturers would do well to plant themselves through reliable representation in various countries and to force their competitors to take business at or below cost if necessary. Neither English nor German manufacturers can keep up this kind of competition indefinitely, it was pointed out. It is very desirable for American manufacturers to consider how they can work effectively together in connection with foreign trade, for the association of British manufacturers is pointing the way toward very efficient team play in the overseas trade problem solution.

## Chicago Electrical Business Shows Slowing-Up Tendency

BUSINESS in the Chicago electrical trade continues about the same as last week, with a tendency toward slowing up rather than increasing. No advances in prices were announced, while a reduction of $5 per 1,000 ft. in flexible armored conductor became effective June 7. Although electrical jobbers report that business in general is a trifle slow, they state that the number of anticipated contracts upon which they have been asked to figure this week is increasing. The building situation remains much the same, which accounts for the lack of active buying.

Demand for socket appliances is normal, with noticeable sales at this time of toasters and waffle irons. Hollow-ware and iron sales are also normal. Sales for this year to date are about the same as last year, with very little increase. The warm weather in this territory just after the first of June caused an active demand for fans, and distributors' stocks were depleted temporarily. However, the cold spell which immediately followed stopped the active sale of this material. Fan manufacturers look forward to a very prosperous season this year. One manufacturer, in conjunction with a large distributor in this city, is putting on a novelty advertising campaign. A fan three times the size of the largest one made for sale is to be mounted on a truck, which will carry advertising placards through the residential sections of the city.

## Eastern Sections Report Steady Volume of Trade

GENERAL electrical business holds up well in the Eastern territory, with improving deliveries and well-rounded stocks on jobbers' shelves. Railroad embargoes are no longer causing trouble. Prices of flexible armored conductor fell about 10 per cent last week, and bare and weatherproof wire were weak, although Monday prices were a bit firmer on copper. Appliance sales continue to run far ahead of last year's. Building contracts in New England totaled $37,877,000 for May, a gain of 11 per cent over April and 14 per cent over May of last year. For the week ended June 5 these contracts totaled $7,655,800, compared with $6,666,500 for the same week in 1922. A spurt in fan sales marked the early part of last week. Labor conditions are good in the main, barring an unsettled situation in the telephone operating field and some difficulties in the shoe industry. Money is easy and contractor-dealers are very busy. Central-station outputs are growing steadily. Manufacturers of automatic substations and generating plants are figuring on a number of important "propositions" in this section.

## Safety Switch Sales Compare Favorably with Six Months Ago

SALES of safety switches are said to compare very favorably with those of six months ago. Deliveries are larger than normal, and the outlook for the next six months, according to leaders in the field, is not very good. There have been some recent advances in prices, but manufacturers say they are unable to predict just what further changes may come in the near future.

## San Francisco Appliance Sales Are Reported Brisk

MAY, 1923, building permits in the four principal California cities totaled: Los Angeles, $18,926,881; San Francisco, $4,928,986; Oakland, $2,373,020, and San Diego, $770,515. May, 1922, totals were: Los Angeles, $9,327,504; San Francisco, $4,377,066; Oakland, $2,243,745, and San Diego, $677,580. Despite encouraging increases in permits, building in northern California is rather slow, with comparatively few big jobs for immediate construction.

Sales of large appliances are slower, but smaller appliances are moving faster, principally because of the stimulus of "June Bride Week." Irons and percolator sets are selling well.

Several large orders are reported, such as a fifty-thousand-dollar high-tension insulator order from a California company and orders for several large rubber-covered wire assortments. Prices have apparently reached a temporary equilibrium.

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | $0.034 | $0.0326 | $0.0256 |
| Cold finished shafting, per lb. | 0.042 | 0.042 | 0.0328 |
| Brass rods, per lb. | 0.1850 | 0.1913 | 0.1533 |
| Solder (half and half), per lb. | 0.2862 | 0.2987 | 0.22 |
| Cotton waste, per lb. | 0.1231 | 0.2812 | 0.104 |
| Washers, cast iron (½-in.), per 100 lb. | 4.66 | 4.66 | 4.00 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 3.08 | 2.96 | 3.11 |
| Machine oil, per gal | 0.349 | 0.349 | 0.383 |
| Belting, leather, medium, off list | 42½% | 42½% | 46¾% |
| Machine bolts, up to 1-in. x 30-in., off list | 44½% | 44½% | 62½% |

## Exports of Electrical Glassware, Generators, Arc Lamps, Flashlights, Etc., from the United States During 1922

(Original data supplied by the Bureau of Foreign and Domestic Commerce)

| | | Globes and Shades for Lighting, Dollars | Electrical Glassware, Except for Lighting, Dollars | Electrical Porcelains, Dollars | Carbons for Electrodes and Batteries, Dollars | Generators Direct-Current Under 500 Kw. | Generators Direct-Current 500 Kw. and Over | Alternating-Current Under 2,000 Kw., Dollars | Arc Lamps, Dollars | Incandescent Lamps Carbon-Filament | Incandescent Lamps Metal-Filament | Flashlights, Dollars | Radio & Wireless Apparatus, Dollars | Telegraph Apparatus, Dollars | Telephone Apparatus, Including Telephone Switchboards, Dollars | Copper Rods, Dollars | Wire of Brass or Bronze, Dollars | Poles, Telegraph, Trolley and Electric Light, Dollars | Cross-Arms, for Telegraph, Telephone and Trolley Poles, Dollars | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Dollars | Dollars | | | Dollars | Dollars | | | | | | | | | | |
| 1 | Azores | 17 | | 2,430 | 131 | 4,233 | | | | | 68 | | 110 | 124 | | | | | | Azores | 1 |

### March and April Heater Cord Sales Exceeded Those for May

PRESENT sales of heater cords are said to be approximately the same as six months ago, although the volume of business handled by manufacturers during March and April was somewhat larger than that for the month of May and the first week of June.

Deliveries are slightly subnormal at the present time, there being a large demand for heater cord, which is likely to continue for at least six or eight months owing to the great number of homes which have been built during the current year and the necessity of having cords for the appliances which will be used in them.

Prices generally have not changed, although the market prices of raw materials have declined within the past five or six weeks. This decline however, has been more than offset by the increase in production costs due to larger wages and the lessened efficiency which invariably exists when labor is at a premium.

### Germany Is No Longer a Serious Competitor

GERMANY is no longer a serious competitor in the machinery field, declared R. A. Lundquist, chief of the electrical equipment division of the United States Bureau of Foreign and Domestic Commerce. Present acute competition is British. American machinery exports last year totaled about $186,000,000 against $50,000,000 before the war. Australia, South America and Asia are expanding their consumption of foreign-made products, and under present conditions the better policy is to "put the soft pedal" on European trade and to concentrate upon these other continents.

The United States should, with proper cultivation, obtain say half the pre-war foreign trade of Germany in machinery lines. Before the war Germany handled about 45 per cent of international trade. Great Britain 25 per cent and the United States 20 per cent. British labor costs are much higher than before; the European situation is complicated by political uncertainties, and disorganizing conditions are being faced by many foreign manufacturers. As the years pass the United States must expect to meet more competition from continental Europe as it recovers equilibrium. In ten years the exportation of high-grade and carefully finished machinery from France is likely to develop. By the terms of the Versailles treaty France received two million more tons of steel than was formerly delivered, and the manufacture of high-grade engineering products is in line with French abilities.

During the conference the point was brought out that a thorough understanding of the terms and principles underlying patent laws in foreign countries is essential to American manufacturers. In South America the laws give priority of application rather than priority of use the preference. A movement has begun, although it is thus far rather weak, to secure uniform patent laws in various parts of the world.

### The Metal Market

THE sentiment in the non-ferrous metal market is somewhat better than a week ago, although business has not been active and prices show little change. The news from Europe seems a bit more encouraging and conditions in that market have been the governing factor recently

The last few days have witnessed some improvement in the demand for copper for the export trade. The surprising thing, according to producers, is that sales are being made at a fraction above the domestic price, which is now quoted at 15 cents a pound. The Copper Export Association is handling most of the business, and while the official price could not be learned, it is understood to range between 15.25 cents and 15.30 cents, c.i.f. European ports. The greater part of the demand at the present time, it was said late last week, is coming from France, but Germany continues a buyer in fair amounts, while other foreign countries are now taking more than they have done in recent weeks.

NEW YORK METAL MARKET PRICES

| | June 7, 1923 Cents per Pound | June 14, 1923 Cents per Pound |
|---|---|---|
| Copper, Electrolytic | 15.00 | 15.00 |
| Lead, Am.S.& R.price | 7.25 | 7.25 |
| Antimony | 8.00 | 7.75 |
| Nickel, ingot | 27.00 to 30.00 | 27.00 to 32.00 |
| Zinc, spot | 6.35 | 6.37 |
| Tin, Straits | 42.20 | 41.90 |
| Aluminum, 98 to 99 per cent | 26.00 | 26.00 |

# Activities of the Trade

Devoted to News of the Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

### Electrical Industrial Sales Firm Organized in Chicago

The Electrical Industrial Sales Company, Inc., is one of the latest organized Chicago companies to serve as manufacturers' agents. This company was incorporated for $10,000 on June 1, and an office of 960 sq.ft. floor space has been taken in the America Fore Building, 844 Rush Street, Chicago. John R. Smith, vice-president and general manager, said: "Our first connection with a manufacturer is with the Kuhlman Electric Company, of Bay City, Mich., and we will handle its complete line of transformers, including its new series disconnecting street-lighting type. In the meantime we will be on the lookout for other manufacturing connections, but intend to take our time in choosing a specialized line supplementing the street-lighting business."

### Westinghouse Electric Creates New Engineering Department

The creation of a new engineering department in the organization of the Westinghouse Electric & Manufacturing Company has been announced by R. S. Feicht, director of engineering. The new department will be known as the porcelain insulator and transmission engineering department, and C. L. Fortescue, well known in electrical engineering, has been appointed manager.

This new department, according to the announcement, will handle the design of line insulators and other work which may be assigned to it from time to time in connection with transmission problems. "The rapid growth in the porcelain business and the steady increase in the number of problems growing out of the transmission of high voltages for great distances has necessitated the creation of a department to handle these problems," declared Mr. Feicht, who made it plain that, in connection with transmission problems, the new department will make studies and analyses of these problems, but will not be concerned with the design of large transmission systems.

### Anaconda Copper May Acquire National Conduit & Cable

The Anaconda Copper Company is expected to acquire the properties of the National Conduit & Cable Company within the near future. The latter company is now in the hands of the court, and a committee of stockholders and bondholders was organized some time ago for the purpose of endeavoring to rehabilitate or refinance the property. Thus far these efforts have not met with success. The committee recently received an offer of $700 for each $1,000 bond of an issue of $4,168,500 of the 6 per cent bonds outstanding, and it was learned last week that the Anaconda organization had made the bid.

Acquisition of the bonds by Anaconda, it was pointed out, would place it in a favorable position to bid in the property at a sale, while the placing of the entire issue in its hands might be expected to hasten the foreclosure of the mortgage securing the bonds. At $700 per bond the cost to Anaconda would aggregate about $2,900,000, but expenses of foreclosure and liquidation are expected to bring the total to approximately $3,000,000.

The National Conduit & Cable Company has a large copper wire and rod plant at Hastings-on-Hudson, as well as a department which specializes in the

manufacture of brass products. The rod and wire mill will help to round out the plans which the officials of the Anaconda company have had in mind for some years and which began to materialize with the acquisition of the American Brass Company in the early months of 1922 and the Chile Copper Company early this year. The properties which Anaconda contemplates taking over are expected to be reorganized.

The stockholders' protective committee recently increased its efforts to save the organization for the benefit of the interest which it represents. Shortly after the offer of $700 per bond had been made the stockholders requested the bondholders to join with them in efforts to save the properties so that the bondholders might get a hundred cents on the dollar for their interest and the stockholders conserve their property. Since then the greater part of the bonds have been deposited with the National City Bank, which is depositary for the bondholders' committee. Unless the stockholders can muster sufficient funds to outbid the Anaconda at a public sale, the latter is expected to take over the properties.

### Wakefield Brass Expansion

The F. W. Wakefield Brass Company of Vermillion, Ohio, is erecting an addition to its plant which will increase manufacturing space about 20 per cent. This addition is made necessary to take care of increased production of its "Red Spot" hangers and other lighting specialties, the demand for which has grown steadily for twenty months.

### Billings of Allis-Chalmers Reach $2,000,000 a Month

Billings of the Allis-Chalmers Manufacturing Company, Milwaukee, are now running at the rate of $2,000,000 monthly or $24,000,000 annually. While total billings for the first quarter amounted to $5,221,000, April and May billings were approximately $2,000,000 monthly, or a total of $4,000,000, and at the present rate of operations the second quarter's total should approximate $6,000,000. Total billings last year were $20,794,000.

The labor shortage is restricting the higher percentage of operations. Were labor to become more plentiful, Allis-Chalmers would undoubtedly speed up operations as the outlook for continued good business by this company is promising. As it stands, unfilled orders are now around $12,000,000 and provide enough business to keep the plants running until December at the present rate of operations.

Present rate of billings of $2,000,000 monthly is taxing the company's plants less than 75 per cent of capacity. It is estimated that present plant facilities have a potential capacity of handling $36,000,000 worth of business annually. In 1918, the company's banner year, plants of the company billed $35,000,000 worth of goods.

### Hurley Machine Report Is Most Favorable

Edward N. Hurley, chairman of the board of the Hurley Machine Company, Chicago, in submitting his annual report to the stockholders of the company, stated that there is no intention of increasing the price of its product.

The balance sheet and income statement for the year 1922 presents a very favorable report on the operations of the company during that period. The year closed with cash in banks and United States certificates of indebtedness totaling $1,529,786, and the inventories of $1,061,673 at the close of business Dec. 31, 1922, show an increase of but $80,364 over the inventory value of Dec. 31, 1921, although the volume of business in 1922 far exceeded that of 1921.

The current liabilities as at Dec. 31, 1922, consist only of those obligations incurred during December, there being no outstanding bank or other loans. The ratio of current assets to current and accrued liabilities was 4.43 to 1.

The net sales of electric washing and ironing machines for the year 1922 show an increase of 27 per cent over the sales for the previous year. The net income for the year 1922 after all charges, including federal taxes, amounted to $635,942, or an increase over the profit of 1921 of 48 per cent. The net income of 1922 after taxes represents 13 per cent on the net sales, compared with 11½ per cent earned on the net sales in 1921.

No increases in the prices of product were made in 1922. Likewise no increases have been placed in effect this year, nor are any planned.

The prospects for the company during the year 1923 are very promising. Orders for product received during the first four months of the year exceed $3,000,000 in value. For the period Jan. 1 to April 30, 1923, billing to customers amounted to $2,316,002, an increase of $831,030 or 56 per cent, over the shipments billed during the same period in 1922. Owing to this increased volume the net profit for the first four months of this year after providing for federal taxes represents an increase of 108 per cent over the net profit for the same period in 1922.

### Pennsylvania Crusher Company Moves Pittsburgh Office

In order to provide more adequate facilities for its volume of business in the Pittsburgh district, the Pennsylvania Crusher Company has recently moved its offices from the People's Bank Building to more adequate quarters in the Oliver Building, where operations will be continued under the management of H. M. Hallett as district manager.

The business of the Pittsburgh office is largely concerned with "Pennsylvania" coal-preparation machinery for mines, by-product coke plants, central stations and industrial power plants, and with heavy-duty primary and secondary crushers for large cement and lime plants.

### Sturtevant Acquires Large Plant in Wisconsin to Aid Business

The B. F. Sturtevant Company, Hyde Park, Boston, manufacturer of motors and ventilating equipment, announces that it has acquired the plant of the Wisconsin Engine Company, Corliss, Wis. This new acquisition covers nearly ten acres and the buildings have approximately 150,000 sq.ft. of floor space.

A full manufacturing and engineering staff will be maintained and closer co-operation given to Western customers. The situation at Corliss will make a substantial reduction in transportation costs.

Shipping facilities are ample as Corliss is on the main line of the Chicago, Milwaukee & St. Paul Railway and is the junction through which trains pass almost every hour between Chicago and Milwaukee. It is also the only express stop on this 85-mile run. Racine also, with her lake ports, is only 6 miles east. Connection may be easily made with all the principal lines east and west, thereby making Corliss ideal from a shipping standpoint.

The new plant will be under the same direction as the other factories at Hyde Park, Galt, San Francisco and Philadelphia with E. N. Foss as president. Harry W. Page has been selected as general manager and will be in entire charge of the Wisconsin plant.

The C. M. Hall Lamp Company, 1035 East Hancock Avenue, Detroit, manufacturer of electric lamps, has plans for a two-story addition, 80 ft. x 172 ft., estimated to cost $80,000.

The Semegra Manufacturing Company, Inc., Utica, N. Y., recently incorporated under the laws of New York State for $6,000, announces that it will engage in the manufacture of electrical fixtures. Directors of the company are Gay H. Brown, M. C. Halsey and M. G. Hubbard, Jr., all of Utica.

The Keps Electrical Supply Company, 961 Liberty Avenue, Pittsburgh, has leased two floors in the building at 967 Liberty Avenue for proposed expansion in operations.

The Pickett Storage Battery Company, Greensboro, N. C., plans for the rebuilding of the portion of its works recently destroyed by fire with loss estimated at about $40,000. including machinery and equipment.

The Ray Battery Company, Ypsilanti, Mich., has been purchased by Arthur Jordan, Indianapolis, owner of the Detroit Battery Company, and the Disco Electric Manufacturing Company, Detroit. The Detroit Battery Company will become affiliated with the Ray Company, and the merged concerns will be known as the Arthur Jordan Battery Company, Ypsilanti, under the management of T. H. Lavier.

## Foreign Trade Notes

PROPOSED WATER-POWER DEVELOPMENTS IN ITALY.—A concession to develop 8,577 hp. from two waterfalls and to erect two power houses on the River Serio, in the Province of Bergamo, has been granted to the Società Italiana Ernesto de Angeli, Milan. The Società Anonima Industrie Reunite di Filati of Bergamo has been granted a concession to develop 2,502 hp. from the same river. Other concessions for water-power developments have been granted as follows: To the Società Marchigiana di Elettricità of Recanati, to develop 3,784 hp.; the Società Unione Esercizi Elettrici, Province of Pesaro, 1,712 hp.; the Società Anonima Idroelettrica Rivallese, Province of Potenza, 5,000 hp., and the Consorzio Intercomunale Destra Piave, Nervesa, Province of Treviso, 2,652 hp., from two waterfalls on the Piave River.

PROPOSED ELECTRICAL PROJECTS IN FRANCE.—Application has been made by the Syndicat Intercommunal de Saint André de Corcy for a concession to distribute electricity in seventeen communes of the department of the Ain. Petitjean Frères, Montagney (Doubs), manufacturers, have petitioned for a concession to furnish electricity to twenty-four communes, four of which are located in the department of Haute Saône. Plans are now being prepared to supply electricity in fifty-seven communes in the department of the Allur. Energy will be supplied to thirty of these communes by the Scieries et Usines Hydro-électriques de la Sioule; the remainder will be served by the Société d'Electricité Générale de Saint-Etienne.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

An agency is desired in Stockholm, Sweden (No. 6,739), for electrical appliances. An agency is also desired in Stockholm (No. 6,741) for electric and gas lighting appliances.

Purchase is desired in Habana, Cuba (No. 6,794), for equipment for lighting plant.

An exclusive agency is desired in Johannesburg, South Africa (No. 6.784), for radiophone sets and equipment.

Purchase is desired in Brussels, Belgium (No. 6,713), of leaded iron strips for insulation tubes and for red rolled-copper wire.

Purchase is desired in Aguascalientes, Mexico (No. 6,754), of bare copper wire.

Purchase is desired in London, England (No. 6,723), of vacuum cleaners, etc.

ELECTRIC EQUIPMENT FOR POWER STATION, WORCESTER, SOUTH AFRICA.—Tenders will be received until Aug. 2 by the City Council of Worcester, South Africa, for an additional electric generating plant for the municipal power station.

ELECTRIC PLANT FOR RIVERSDALE, SOUTH AFRICA.—Tenders will be received by the Municipal Council of Riversdale, Cape Province, South Africa, until July 31 for an electric generating plant, distribution material, meters, etc.

## New Apparatus and Publications

ALLOYS.—"Alloys for Electrical Resistance" is the title of data book R-23 issued by the Driver-Harris Company, Harrison, N. J., in which it describes its alloy products and their use. It contains charts showing temperature-resistance curves and also charts showing change in resistance with temperature.

LAMP GUARDS.—The Flexible Steel Lacing Company, 4607 Lexington Street, Chicago, has added two new numbers to its "Universal" line of lamp guards, "Flexco" No. 220 and "Flexco-Lok" No. 420R.

AUTOMOTIVE INSTRUMENT.—The Celtokay Manufacturing Corporation, 175 Fifth Avenue, New York City, has developed an automotive instrument "Cell-O-Meter," which gives the exact electrical condition of the storage battery under any conditions.

INSTRUMENT STERILIZER.—The Walter Electric & Manufacturing Company, Mansfield, Ohio, has brought out the "Perfect" electric instrument sterilizer.

VACUUM CLEANER.—The Clements Manufacturing Company, 616 Fulton Street, Chicago, has placed on the market an electric "Cadillac" vacuum cleaner.

METER-TESTING SWITCH.—The Aurora Steel Products Company, Aurora, Ill., has added a meter-testing switch to its line of switches.

PORTABLE HANDLAMPS.—The Oliver Electric & Manufacturing Company, St. Louis, has brought out a line of portable handlamps with and without reflectors.

AIR COMPRESSOR.—A two-stage compressor mounted on and piped to a 32-gal. tank for stationary installation has been brought out by the Brunner Manufacturing Company, Utica, N. Y.

FIRE-ALARM SIREN.—The Erick Siren Company, Inc., 95 South Wabasha Street, St. Paul, has placed on the market an electric fire-alarm siren.

MOTOR-DRIVEN PUMP.—The Arrow Pump Company, Buhl Building, Detroit, has placed on the market a motor-driven centrifugal pump, in which it has incorporated its ring-oiled packing-gland feature.

WIRES AND CABLES.—The United States Rubber Company, 1790 Broadway, New York City, is distributing a new catalog covering its "U.S." paracore wires and cables.

CONDUIT FITTING.—The Killark Electric Manufacturing Company, Easton and Warne Avenue, St. Louis, has developed a new conduit fitting, type "Y," which is used in making a right-angle bend in rigid conduit.

LIGHTING FIXTURES.—The Crouse-Hinds Company, Syracuse, N. Y., is distributing a folder covering its various types of "Vaporproof" condulets complete with reflectors. Bulletin No. 2,001 issued by the company describes its flexible fixture hangers.

AUDIOMETER.—Adam Hilger, Ltd., 75a Camden Road, London, N. W. 1, is distributing a pamphlet describing the Low-Hilger "audiometer," formerly known as the Hilger "optical sonometer," designed to record the pressure variation caused by sound waves.

AMPERE HOUR METER.—Bulletin No. 62 issued by the Sangamo Electric Company, Springfield, Ill., covers its "Locomotive" type ampere hour meter. This meter is built especially for use on electric trucks, electric pleasure vehicles, storage-battery tractors and mine locomotives.

IGNITION COIL.—The American Bosch Magneto Corporation, Springfield, Mass., has brought out a new ignition coil, known as the Bosch "Armored", in types TC-30 and TC-40, which is described in the May issue of the *Bosch News*. The company has also developed a new type 600 Bosch ignition system for Ford cars.

CAPSTAN CAR PULLER.—The Gifford-Wood Company, Hudson, N. Y., is distributing bulletin No. 74, describing the new "G-W" electric capstan car puller.

INCLOSED KITCHENETTE.—An electrically wired kitchenette inclosed in a console-type cabinet has been brought out by the Space-Saving Furniture Company, 11 West Thirty-second Street, New York.

RECEPTACLES.—A new line of standard receptacles and plugs for convenience outlets known as "T-Slot," has been brought out by Pass & Seymour, Inc., Solvay, N. Y.

ELECTRICAL REFRIGERATING SET.—The National Refrigolier Company, Greenville, Ohio, has placed on the market an electrical refrigerating set for domestic use.

FLASHLIGHT.—A two-in-one flashlight, "Double-Duty," has been developed by the Yale Electric Corporation, Brooklyn, N. Y., which at one end gives a diffused light over a wide radius and at the other end a spotlight with focusing reflector and lens.

## New Incorporations

THE OKLAHOMA HYDRO-ELECTRIC COMPANY, Oklahoma City, Okla., has been incorporated with a capital stock of $10,000 by Abram Stanfield, Tracy Wilkerson, both of Tulsa, and M. A. Schull, Oklahoma City.

THE CENTRAL QUEBEC POWER COMPANY, Quebec, Que., has been incorporated with a capital stock of $1,000,000 by Jacques Perron, Auguste Mathieu and James McCullum, all of Montreal.

THE LEAGUE CITY (TEX.) LIGHT & POWER COMPANY has been organized with a capital stock of $2,400 by W. M. Truxaw, E. T. Arnett and C. Trifton, to supply electricity in League City.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

NASHUA, N. H.—Conveying machinery and power equipment, traveling crane, etc., will be installed in the new creosote wood-treating plant to be erected at Nashua by the Boston & Maine Railroad Company, to cost about $150,000.

SHELDON SPRINGS, VT.—The Mississippi Pulp & Paper Company contemplates building a manufacturing unit and power plant, etc., to cost about $500,000.

BOSTON, MASS.—Electric power equipment will be installed in the automobile service building to be erected by the Department of Public Works, to cost about $150,000. Mulhall & Homers, 248 Boylston Street, are architects.

BOSTON, MASS.—The Edison Electric Illuminating Company is preparing plans for the construction of a substation on West Canton Street. Bigelow & Wadsworth, 3 Hamilton Place, are architects.

LOWELL, MASS.—The Lowell Electric Light Company plans an addition to its power plant, to cost about $80,000. A new steel coal and ash-handling conveyor system will be installed. Stone & Webster, Inc., 147 Milk Street, Boston, is engineer.

## Middle Atlantic States

LOCKPORT, N. Y.—The Niagara, Lockport & Ontario Power Company has issued $3,000,000 in notes, part of the proceeds to be used for extension to plant to develop a maximum of 225,000 hp., and for line extensions.

MINEVILLE, N. Y.—Witherbee, Sherman & Company, 2 Rector Street, New York, contemplates rebuilding their power plant at their iron-ore properties, recently destroyed by fire with loss of about $75,000.

NEW YORK, N. Y.—Electric power equipment will be installed in the municipal repair works and reclamation building to be erected on Barren Island by the Department of Plants and Structures, for which an appropriation of $4,500,000 has been granted.

NEW YORK, N. Y.—Electric power equipment will be installed in the printing plant to be erected at 13 Frankfort Street by the Press Publishing Company, 63 Park Row, to cost about $150,000. Cross & Cross, 385 Madison Avenue, are architects.

SCOTIA, N. Y.—The Scotia Electric & Manufacturing Company, recently organized, plans to erect an electric transmission line and distributing system. J. H. Gould, Schenectady, is representative of the company.

ALLENTOWN, PA.—Plans for the proposed new relay plant to be erected by the Bell Telephone Company between Allentown and Emaus, to cost about $250,000, include an electric power plant.

ERIE, PA.—Plans are being considered by the City Council for the installation of a conduit system in East Tenth, Upper Peach, West Thirty-first, South Cherry, Parade, Liberty and East Twenty-first Streets, to cost about $70,000. F. G. Lynch is city engineer.

GLENSIDE, PA.—The Abington Township School Board has had plans prepared for a power house at the local high school. Heacock & Hokanson, 1218 Chestnut Street, Philadelphia, are architects.

HARRISBURG, PA.—The South Creek Township Electric Company, the Columbia Township Electric Company and the Springfield Township Electric Company are being organized by H. R. Palmer and F. H. Hill, Harrisburg, to construct and operate a transmission system, with distributing lines, in the townships named. Spencer G. Nauman and J. E. B. Cunningham, Harrisburg, represent the companies.

MAHANOY CITY, PA.—The Lehigh Valley Coal Company, Wilkes-Barre, Pa., is planning to install motors, controllers and other equipment at its No. 1 Park works, near Mahanoy City.

NANTY GLO, PA.—The Nanty Glo Business Men's Association and the New York Silk Manufacturing Syndicate are consider-

ing the erection of a mill and a power house, to cost about $150,000.

PHILADELPHIA, PA. — The Atlantic Refining Company, 3144 Passyunk Avenue, Philadelphia, contemplates the erection of a steam power house and pumping plant at Passyunk Avenue and the Schuylkill River.

PHILADELPHIA, PA.—A power plant will be built at the proposed bakery to be erected at 4811 Germantown Avenue by J. S. Ivins' Sons, Inc., 619 North Broad Street, to cost about $600,000. W. E. S. Dyer, Land Title Building, is engineer.

PHILADELPHIA, PA. — Plans for the proposed hat-manufacturing plant of Frank Schoble & Company, Tenth and Oxford Streets, include a power plant. William Steele & Sons Company, Arch and Sixteenth Streets, is engineer and contractor.

PITTSBURGH, PA. — Receivers for the Pittsburgh Railways Company, 435 Sixth Avenue, plan to purchase twenty electric railway motors, an electric grade shovel and other equipment.

PITTSBURGH, PA. — The Blanchard-Moshannon Mining Company, Fulton Building, recently organized with a capital of $800,000, plans to install electric power equipment and mining machinery at its properties in Clinton County.

PITTSBURGH, PA.—Bids will be received by John P. Moore, county controller, Court House, Fifth Avenue, until June 27 for electric power and lighting equipment for installation in the Liberty tunnels, now in course of erection. A. D. Neeld, Bakewell Building, is county engineer.

ANNAPOLIS, MD.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until June 19, for one motor-generator set for use at the local naval station. (Schedule 933.)

BALTIMORE, MD. — The Baltimore & Ohio Railroad Company contemplates the construction of a substation on its proposed general merchandise pier on the Patapsco River, to cost about $2,000,000.

PERRYVILLE, MD.—Bids will be received by the United States Veterans' Bureau, Arlington Building, Washington, D. C., until June 25 for construction of an occupational therapy building at United States Veterans' Hospital No. 42, including electrical and heating installations. Frank T. Hines is director.

WILLIAMSPORT, MD.—The Potomac Edison Company, recently organized to take over the Williamsport Power Company and to acquire and merge the Edison Electric Illuminating Company and the Cumberland Electric Railway Company, both of Cumberland, has issued $3,900,000 in bonds, the proceeds to be used in part for a steam-operated generating plant at Williamsport, with capacity of 20,000 hp., designed for an ultimate output of 240,000 hp. Extensions will be made in transmission lines.

BLUEFIELD, W. VA.—The Appalachian Power Company contemplates extensions to its electric power plants and transmission system for power service in the West Virginia coal fields.

CLIFTON, W. VA.—The Richland Coal Company contemplates the installation of electric power equipment and other machinery at its properties.

NORFOLK, VA. — The Miles Lumber Company, recently organized, is planning to build a new mill and power house, to cost about $100,000. G. Benson Ferebee is president.

ROANOKE, VA. — The Roanoke Street Railway & Electric Company plans extensions and improvements in its electric plant and system to cost about $100,000.

STAUNTON, VA.—Electrically operated pumping machinery will be installed in connection with the new water supply system for the municipal waterworks, to cost about $1,000,000. Fuller & McClintock, 170 Broadway, New York City, are consulting engineers.

WASHINGTON, D. C.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, until June 26 for miscellaneous fuses and fuse elements, for various navy yards. (Schedule 924.)

## North Central States

GRAND RAPIDS, MICH.—Permits have been granted for buildings for the Père Marquette Railroad Company, to cost about $630,000, including a power house, to cost about $114,000, and a locomotive and boiler shop, to cost $462,000.

ISHPEMING, MICH. — The Hercules Power Company is planning to build a power plant to cost about $125,000.

LORAIN, OHIO.—Steps have been taken by the Chamber of Commerce for the installation of an ornamental lighting system on Broadway and Erie Avenue.

PADUCAH, KY.—The Paducah Electric Company has authorized Stone & Webster, Inc., Boston, engineer, to prepare plans for a power-plant addition, to cost about $350,000. The equipment will include a 2,500-kw. generator, coal and ash-handling and conveying machinery, etc. Another plant unit of approximately the same size will be built later.

PIKEVILLE, KY.—The property and franchises of the Sandy Valley Light & Power Company have been acquired by the Kentucky & West Virginia Power Company, Pikeville, which will extend and operate the lines.

CAMBRIDGE CITY, IND.—Robert Ashe has secured permission to purchase the local municipal electric plant. A company will be formed to operate the system. Extensions and improvements will be made.

KENDALLVILLE, IND. — Plans are under consideration for extensions to the municipal electric and waterworks plant, to cost about $40,000. H. H. Morteroff is city engineer.

MOUNT VERNON, IND.—The Southern Indiana Gas & Electric Company has been granted permission to acquire the property of the Mount Vernon Electric Light & Power Company. Additions and improvements will be made, including transmission line extensions.

WHEATFIELD, IND. — The Kankakee Valley Electric Company has received permission to purchae the Wheatfield Light & Power Company. Extensions are contemplated to the local plant and transmission lines.

CHIPPEWA FALLS, WIS.—The Wisconsin-Minnesota Light & Power Company contemplates building a power plant here.

LA CROSSE, WIS.—Plans for the proposed factory to be erected by the Weiss Manufacturing Company include a power house.

MANITOWOC, WIS. — The Manitowoc Portland Cement Company, a subsidiary of the Newaygo Portland Cement Company, Newaygo, Mich., plans to build a power plant in connection with its proposed local cement mill, to cost about $1,500,000.

ST. PETER, MINN.—Plans are under consideration for remodeling the power plant at the State Hospital, to cost about $100,000. Bids, it is understood, will be asked this summer for the work. D. F. Mullan, Capitol Building, St. Paul, is secretary of state board of control.

BONAPARTE, IOWA.—The Iowa Electric Company, Cedar Rapids, has appropriated $22,475 for a 13,200-volt transmission line from Birmingham to Bonaparte, to connect up the latter town with the Fairfield plant. The company was recently granted a franchise in Bonaparte and will install a local distributing system, to cost about $8,900.

DUBUQUE, IOWA.—The proposed new pumping station to be erected at Eagle Point by the City Water Department will be equipped with electrically operated pumping machinery.

JOPLIN, MO.—At an election to be held June 19 the proposal to issue $80,000 in bonds for improvements to the street-lighting system will be submitted to the voters.

REPUBLIC, MO.—The Lawrence County Light & Power Company, Aurora, has applied to the City Council for a franchise to supply electricity here.

STOCKTON, MO.—Bonds to the amount of $20,000 have been voted for the installation of a municipal electric light plant.

CUSTER, S. D.—Plans have been prepared by Chenoweth, Kennedy & Rittenhouse, consulting engineers, Sioux Falls, for a combined power and heating plant for the South Dakota State Sanatorium at Custer.

MADISON, S. D.—The project for the erection of a transmission line from the municipal electric plant to the Chatauqua grounds at Lake Madison has been postponed until next year.

CODY, NEB.—Bonds have been voted for the erection of an electric transmission line from Cody to the hydro-electric plant at Valentine.

HEBRON, NEB.—The Hebron Light & Power Company has consolidated with the Union Light & Power Company of Abilene, Kan. A transmission line will be erected connecting with the system of the Southern Nebraska Power Company at Deshler, the latter line being owned by the Union company.

OXFORD, KAN.—W. B. Rollins & Company, Railway Exchange Building, Kansas City, Mo., engineers, have been commissioned to prepare plans for a municipal transmission line from Winfield to the Arkansas River station (5½ miles) to cost $18,000. Bonds have been voted.

## Southern States

HENDERSON, N. C.—Work has started on the second hydro-electric development of the Blue Ridge Power Company on the Green River in Polk County, to be known as the Turners Shoals. It is proposed to develop 10,000 hp. at a cost of about $1,000,000.

HIGH POINT, N. C.—Plans are being prepared by the J. B. McCrary Company, Atlanta, Ga., for a hydro-electric plant and for water and sewerage systems, to cost about $100,000.

SYLVA, N. C.—Plans are in progress for the construction of a new power house at the Cullowhee Normal & Industrial School. H. A. Underwood, Raleigh, is engineer.

CAYCE, S. C.—The Pace Lumber Company, Hendersonville, N. C., plans to construct a power house at its proposed local mill.

CHARLESTON, S. C.—The installation of a new street-lighting system is under consideration by the Council. Louis D. Rubin is chairman of the lighting committee.

COLUMBIA, S. C.—The University of South Carolina will install additional equipment in the power house at the institution. Lefaye & Lefaye, Loan and Exchange Building, are architects.

HEATH SPRINGS, S. C.—Bonds to the amount of $35,000 have been voted for the installation of an electric lighting system and waterworks. The project includes the erection of an electric transmission line (11 miles) connecting Lancaster and Heath Springs, to cost about $17,300. The Ryan Engineering Company, Columbia, is engineer.

ATLANTA, GA. — A permit has been granted to the Georgia Railway & Power Company to build a substation on Stewart Avenue between Wells and Glenn Streets, to cost about $20,000.

HAMILTON, GA.—A power house will be installed at the proposed local brick and tile manufacturing plant to be built by a new company now being organized by Thomas M. Walker.

JASPER, FLA.—Preliminary surveys are being made by B. M. Hall & Sons, Atlanta, Ga., for a proposed hydro-electric plant near here.

MIAMI BEACH, FLA.— The Miami Beach Power Company plans extensions and improvements to its plant, to cost about $150,000.

TAMPA, FLA.—Plans are being considered for the construction of a power house in connection with the proposed local phosphate-fertilizer works to be built by the Chemical Construction Company, Charlotte, N. C., to cost about $1,000,000.

COVINGTON, TENN.—Steps are being taken for the construction of a municipal electric power plant, to cost about $30,000. It is proposed to use oil for fuel.

KNOXVILLE, TENN. — The Knoxville Power & Light Company has applied to the Federal Power Commission for permission to build hydro-electric plants on the Holston River with total capacity of 150,000 kw.

FLINT, ALA. — The Southern Rock Asphalt Company contemplates the construction of a power house at its proposed local refining plant, to cost about $150,000.

HUNTSVILLE, ALA. — The Council is considering the installation of an electrically operated pumping machinery in the waterworks station.

MONTGOMERY, ALA.—Work has started by the Alabama Power Company on the reconstruction of the Tallassee dam, to cost about $500,000. About 10,000 hp. will be developed and a transmission line will be erected from Montgomery to Tallassee.

LOUISVILLE, MISS.—Bonds have been approved for $30,000 for the installation of a municipal electric plant.

DOVER, ARK.—The Arkansas Light & Power Company plans to erect a transmission line from Russellville 5 miles.

HAMMOND, LA.—The Louisiana Utilities & Manufacturing Company, recently formed with a capital of $1,000,000, plans an addition to its local power plant, including the installation of new equipment. It is also purposed to construct an ice-manufacturing and cold-storage plant.

MINCO, OKLA.—The proposal to grant a twenty-five-year franchise to the Chickasha (Okla.) Gas & Electric Company in Minco will be submitted to the voters on June 26.

CANYON, TEX.—The installation of an ornamental lighting system is under consideration.

DENTON, TEX.—A special election has been called July 7 to vote bonds for $90,000 for a municipal electric power plant, extensions in the waterworks and sewerage systems.

HOUSTON, TEX. — Contract has been awarded by the Navigation District Commission for excavation on the site of six wharves to be built on the north side of the turning basin. The plans for port improvements include construction of six wharves, grain elevator and wharf, railway yards, water supply and electric system. Bonds to the amount of $4,000,000 have been sold for the work.

WAELDER, TEX.—The City Council has granted E. Koenig a franchise to construct and operate an electric light plant here.

## Pacific and Mountain States

MOUNT VERNON, WASH.—The Skagit Valley Power Company, recently organized with a capital of $400,000, plans to construct a power plant and transmission system. C. J. Henderson is interested in the company.

VANCOUVER, WASH.—The Northwestern Equipment Company, Seattle, is reported to be planning to erect a branch plant, including a power house, in Vancouver for making logging trucks.

THE DALLES, ORE.—The Pacific Power & Light Company will commence surveys for a site for a hydro-electric power plant on the Deschutes River, with initial capacity of 40,000 hp., to cost about $2,000,000.

AUBURN, CAL.—Application has been made by the American River Water & Power Company for permission to construct and operate a hydro-electric power plant on the Middle Fork of the American River to develop 150,000 hp.

BERKELEY, CAL.—The Pacific Gas & Electric Company will receive bids at once for the construction of a substation at Hearst and McGee Avenues, to cost about $50,000.

GRASS VALLEY, CAL.—Sidney Wood and associates, care of Nilon & Nilon, attorneys, have made application for permission to construct and operate a hydro-electric power plant on the Big Canyon Creek, Nevada County.

LOS ANGELES, CAL.—Application has been made by the Municipal Power Bureau for permission to construct and operate two hydro-electric power plants on Big Pine Creek, and Cottonwood Creek, with rated capacities of 27,900 hp. and 11,300 hp., respectively. The cost is estimated at $3,188,000 and $1,900,000, respectively.

LOS ANGELES, CAL. — The French China Company, Sehring, Ohio, plans to construct a power house at its proposed local pottery, to cost about $1,200,000.

SAN FRANCISCO, CAL.—The Yuba Development Company, Hobart Building, has applied for permission to construct and operate a hydro-electric power plant on the Yuba River, Yuba County, to cost about $6,000,000.

SARATOGA, CAL. — Steps have been taken by the Saratoga Improvements Club for the formation of a lighting district.

DENVER, COL. — The State Utilities Commission has granted the Colorado Power Company permission to operate plants in the towns of Antonito and Manassa. The company will take over the plants already in operation.

## Canada

OWEN SOUND, ONT.—The proposal of the Hydro-Electric Power Commission of Ontario to erect a tie line connecting Eugenia with the Niagara system between Harriston and Mount Forest and a second flume at Eugenia to increase the output to 8,000 hp. has been indorsed by the Eugenia Electric Association.

TORONTO, ONT.—Work will soon begin on a large addition to the Hydro substation at Carlaw Avenue and Gerard Street, to cost about $300,000.

YORK TOWNSHIP, ONT.—An issue of $150,000 in debentures has been authorized by the Township Council to meet the cost of extensions to the Hydro-Electric power distribution system.

ST. ADEPHE-DE-CHAMPLAIN, QUE.—The Electric Service Corporation, Shawinigan Falls, has been granted permission to erect a transmission and distribution system to supply electricity here.

MORSE, SASK.—The Municipal electric light and power plant was recently damaged by fire, causing a loss of about $12,000.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued May 22, 1923)

1,456,300. MOTOR GOVERNOR; W. W. Dean, Wilmette, Ill. App. filed June 20, 1919. For phonograph motors.

1,456,343. ELECTRIC HEATING APPARATUS FOR WAVING OR CURLING THE HAIR; E. F. Suter, London, England. App. filed Sept. 19, 1922.

1,456,385; FUSE BOX; A. T. Kvarnstrom, Detroit, Mich. App. filed July 30, 1920. Switch or fuse box in detachable units.

1,456,420. STORAGE-BATTERY CONNECTION; B. B. Blackburn, St. Petersburg, Fla. App. filed Jan. 11, 1921. Non-corrosive terminal.

1,456,440. FLASHLIGHT ATTACHMENT FOR GUNS; J. P. Hist, Hightown, Va. App. filed March 3, 1922.

1,456,495. MANUFACTURE OF CARBON ELECTRODES; S. E. Sieurin, Hoganas, Sweden. App. filed July 31, 1920. From tar and carbon powder.

(Issued May 29, 1923)

1,456,500. ADJUSTABLE MOUNTING FOR TERMINAL BANK PANELS; O. F. Forsberg, Yonkers, N. Y. App. filed Dec. 4, 1919. Relates to automatic telephone systems.

1,456,501. DESK STAND FOR HAND TELEPHONES; O. M. Giunt, Rutherford, N. J. App. filed Aug. 19, 1920. For automatic systems.

1,456,504. ELECTRODE-SUPPORTING DEVICE; W. G. Housekeeper, New York, N. Y. App. filed April 13, 1920. For vacuum tubes.

1,456,505. ELECTRIC DISCHARGE DEVICE; W. A. Knoop, Brooklyn, and P. P. Cioffi, New York, N. Y. App. filed May 12, 1919. Electron tube.

1,456,507. TANDEM ALLOTTING SYSTEM; A. E. Lundell, New York, N. Y. App. filed May 21, 1919. Distribution of apparatus in automatic telephone systems.

1,456,508. NUMBER-INDICATING SYSTEM; A. E. Lundell, New York, and T. van Amstel, Douglaston, N. Y. App. filed July 26, 1919. Interoffice automatic telephone systems.

1,456,510. TRANSMISSION CIRCUITS; R. G. Mathes, New York, N. Y. App. filed Nov. 21, 1919. Two-way telephone repeating systems.

1,456,511. TRANSMITTER; J. P. Minton, New York, N. Y. App. filed Sept. 5, 1919. For places subjected to severe noises or vibrations.

1,456,516. CONNECTING PLUG; W. E. Riecken, Glendale, N. Y. App. filed April 26, 1918. Telephone jack.

1,456,517. MEASURING INSTRUMENT; F. W. Roller, East Orange, N. J. App. filed Oct. 22, 1920. Method of damping ammeters, voltmeters, etc.

1,456,520. ENERGIZATION AND CONTROL OF VACUUM TUBES; H. E. Shreeve, New York, N. Y. App. filed May 28, 1921. For telephone systems.

1,456,523. METHOD OF AND APPARATUS FOR TREATING METALS; R. F. Trimble, Elizabeth, N. J. App. filed July 19, 1919. Manufacture of electron tube elements.

1,456,528. ELECTRIC DISCHARGE DEVICE; H. D. Arnold, East Orange, N. J. App. filed May 10, 1915. Vacuum tube with large current output.

1,456,533. TYPEWRITING MACHINE; P. H. Burdick, Geneva, Ill. App. filed Nov. 6, 1920. Magnetically operated.

1,456,534. PRINTING TELEGRAPHY; H. A. Burgess, New York, N. Y. App. filed Nov. 25, 1919. Receiving apparatus of type-bar sort.

1,456,536. TELEPHONE SYSTEM; E. H. Clark, New York, N. Y. App. filed Dec. 4, 1919. Selective signaling apparatus for subscribers' lines.

1,456,537. TELEPHONE EXCHANGE SYSTEM; E. H. Clark, Richmond Hill, N. Y. App. filed May 19, 1920. Relates to machine-switching apparatus.

1,456,538. ACOUSTIC APPARATUS; I. B. Crandall, New York, N. Y. App. filed Dec. 24, 1917. Telephone receiver.

1,456,549. COMPOSITE SIGNALING CIRCUITS; B. P. Hamilton, Brooklyn, N. Y. App. filed Aug. 29, 1919. Plurality of signaling channels imposed upon same circuit.

1,456,550. ELECTRIC DRIVE MECHANISM; G. E. Hampton, Pittsburgh, Pa. App. filed Jan. 10, 1917. Reciprocatory element employed.

# How Much Do You Believe?

THEORETICALLY all electrical men believe in electricity. They are convinced that electric light is the best light and electric power the best power and that the modern home should be equipped with all the modern electrical appliances. But how much do they believe?

Not long ago the president of a large electrical appliance manufacturing company was riding on a Western train with a party of electrical men bound to an electrical convention. The conversation worked around to merchandising policies and the future of appliances. The manufacturer asked all of them in turn if in their homes they were then using washing machines, ironing machines and vacuum cleaners. None of them was, though one of these men was selling this manufacturer electrical supplies in quantity and another sold him advertising space. He took two orders on the spot.

They all believed in these three appliances—but how much? It is another case of "Physician, heal thyself!"

Within the last few months there have been a number of contests held at meetings of electrical people to see which one lives in the best electrically equipped home. At the N. E. L. A. convention, as told elsewhere in this issue, several prominent central-station men won prizes and some others equally prominent were far down on the list. But each time a mere fraction of those present and eligible enter the contest. Only a handful can claim any adequate equipment. In every case it has been a striking demonstration of the fact that electrical men, at least in their own homes, are not "doing it electrically." They believe in electrical appliances, but apparently not enough to offset the inertia of the too common attitude that these are devices to be sold for other folk to use.

There are about 150,000 employees of the central stations that serve the U. S. A. Half of them might easily be using several appliances. One-tenth of them could be living in homes completely electrically equipped. This would mean 15,000 permanent electric homes on demonstration through the land, each exhibiting to its neighborhood and its own circle of friends the benefits of modern electric service. Consider what an influence for the more extended use of electricity such a conspicuous example would be.

# Frederick Darlington

*A specialist in the conservation of natural resources and the increasing of human efficiency by the use of power.*

A STRIKING exemplification of the progress made by engineering science in recent years is found in the fact that it is necessary to deal with aggregations of engineering projects involving large areas and aggregations of industry when planning a power system. Men with a creative imagination and broad vision are required to grasp modern complex power situations.

Economical planning to meet the present and future needs for power is the inspiring task of Frederick Darlington, consulting engineer for the Westinghouse Electric & Manufacturing Company. Among the details that figure conspicuously in his plans are the development of water powers, the centralization of the generation of power, the elimination of all small and inefficient power plants, the electrification of the railroads and the general use of electricity for all possible purposes.

Though Mr. Darlington has always advocated these principles, he was especially impressed with the necessity of their adoption on a national scale through his experience as chief of the Power Section of the War Industries Board.

Mr. Darlington was born at Lincoln University, Pa., in 1867. He was graduated from the Pennsylvania State College in 1886. His first work of consequence was as chemist for the Westinghouse Electric Company in 1891, when he took part in some of the early developments of electrochemistry. He then joined the United Electric Light & Power Company and the Brush Illuminating Company, New York, engaged with construction and operation; but in 1898 he gave this work up for the more congenial task of undertaking engineering and scientific investigations in gases and electrochemical reactions with William Stanley and C. C. Chesney in Great Barrington, Mass.

In 1898 he again became associated with the Westinghouse Electric & Manufacturing Company in an engineering capacity, and in 1905 he was appointed vice-president and general manager of the Alabama Power Company, where he once more encountered the practical details of electrical engineering.

In order to be a factor in the preparation and execution of plans for nation-wide development, he accepted in 1913 the position of consulting engineer with the Westinghouse organization, which post he has held ever since except for an interval during the war.

Mr. Darlington is interested in many activities in the industry and possesses a host of friends. He is a fellow of the A. I. E. E. and a member of the Union League, Engineers', Lawyers' and other clubs.

# Editorial Comment

Electrical World, June 23, 1923

Volume 81 Number 25

## A Gifted Engineer Passes Away

IN THE death of Dr. Louis Bell of Boston the electrical industry loses an engineer of wide reputation and great versatility—one who added dignity and luster to the profession he represented and whose acquaintanceship was highly prized abroad as well as at home. Dr. Bell grew up with and formed part of the electrical industry. He was a pioneer in the transmission of electrical energy and in the art of illumination. He it was who proposed fifty cycles as a standard frequency at a time when frequencies were uncommonly numerous, but his proposal, except in southern California, went unheeded, and, as it subsequently developed, much to the industry's loss. Dr. Bell plied a facile and gifted pen and from 1890 to 1892 he was editor of the ELECTRICAL WORLD and up to the time of his death a valued editorial contributor.

He possessed a strong personality and was fearlessly aggressive. What he believed he believed with all his might. There was no half-heartedness in his advocacy. He held firm convictions, never stood on ceremony in expressing them and was an excellent champion for causes he approved. To the staff of the ELECTRICAL WORLD Dr. Bell's loss comes as a wrench after years of close association and good fellowship. Long acquaintance served but to increase esteem and admiration. His departure removes from the industry a figure of influence and force, while at the same time adding to the list of departed leaders who have left examples worthy of emulation.

## Higher Temperatures Must Await Developments in Metallurgy

IT WAS very encouraging to hear Fred N. Bushnell of Stone & Webster express the opinion before the Technical Section of the National Electric Light Association at the recent convention that he is confident of the soundness of seeking greater plant economies through use of higher steam pressures. Materials and methods available at present will probably permit the use of steam pressures up to 1,200 lb., but temperatures higher than 750 deg. must await further developments in metallurgy. There is no proposal to go to temperatures which materials have not already proved their ability to withstand.

Since the opinion is expressed by several authorities that higher temperatures cannot be handled with existing designs and materials, it behooves the industry, and especially manufacturers of pipes, valves and fittings, to make exhaustive tests of the characteristics of different metals at temperatures above those now considered standard. A fruitful source of information will be supplied if analyses are made of the results which are being obtained with high-temperature pipes, valves and fittings in the oil-refinery field. There must surely be a definite determination made as to whether the elastic limit of steel is greatly lowered by high temperatures since deformation of the metal thereby may be the chief cause contributing to ultimate failure. Torsional strength of heated steel and fatigue of structures when subjected to expansion and contraction under stress and high temperature offer other subjects for investigation. Studies must also be made of designs which are particularly adapted to equalizing high-temperature stresses as well as of construction which will permit the least serious deformation. It is not to be doubted that the answers to these many questions will lead to high-temperature practices, but engineers are not minded to experiment much without knowing the ground they are treading.

## A Permanent Place for Electrical Exhibitions

ELSEWHERE in this issue information will be found about the newly completed permanent "home of electrical industries" in Leipsic. While there is nothing in this country that corresponds to the "Leipziger Messe," an annual fair on an international scale, yet our electrical industry is surely of such importance that it should have annual co-operative exhibition places in New York and in Chicago, and possibly in a few other industrial centers. Any one who has had anything to do with temporary exhibits and with annual shows knows how unsatisfactory it is to demonstrate electrical apparatus under crowded conditions in a flimsy booth, without adequate wiring or supports, and before visitors who are mostly bent on having a good time or are collecting souvenirs. Contrast this with a large stone building of dignified architecture bearing an inscription "Permanent Exhibit of Electrical Industries," where various manufacturers could have permanently assigned space fitted to suit their particular requirements. The exhibitors could show the same apparatus year after year, making changes where new types have been developed.

In New York the best place for such a home would probably be near the Engineering Societies Building, and the exhibit building could be open either the year around or only during the winter months when conventions and meetings of all sorts occur there in almost uninterrupted succession. In fact, such a permanent exhibition should become an additional attraction of the city.

Already other industries have permanent exhibits in this country, so that the electrical industry of America could not claim the distinction pertaining to the industry in Germany of having built the first permanent exhibit home. Nevertheless the time is ripe to give this matter serious thought. Groups of our industry are already linked together through the Joint Committee for Business Development, the Society for Elec-

trical Development and other associations. It should not be difficult to obtain co-operation for building and operating a few homes for exhibits, the stock to be held principally by the exhibitors themselves. The idea of the "home electrical" has been tried on a small scale and proved to be a great success, electrical shows have drawn large attendance in many cities, and it would seem that the same idea extended to exhibitions of applications of electricity in various industries should be a still greater success. The advantages to our foreign trade of a national exhibit home should also be borne in mind.

## At Last Some One Takes Notice of the Operating Man

STANDARDS have been made in technical nomenclature, standards have been worked out for ratings, standards for tests, standards for this, that and the other; but it has apparently not occurred to any one to produce any group standards for the operating man in whose care equipment is placed and upon whom dependence is placed for continued uninterrupted satisfactory service. Individual manufacturers have issued instructions on particular equipment; individual operating companies have devised their own operating codes. But it has remained for the Electric Power Club to take a real constructive step by starting to issue a series of booklets, as a group activity, on the care and operation of various classes of equipment within the purview of the club. The first booklet is that on the "Care and Operation of Power Transformers"—an eight-page pamphlet, just issued, which can be obtained from any member of the Transformer Section of the club.

Those who are charged with the care and operation of electrical equipment will certainly be grateful to the club members for following their equipment into service and for their joint action, as a club, in extending their standardizing efforts to the use of equipment as well as to its manufacture and rating.

## The S. E. D. Finding Its Place and Gaining Prestige

THERE is real encouragement to electrical men in the evidences, now multiplying, that the Society for Electrical Development is at last finding itself and becoming established as the recognized workshop to which publicity and promotional jobs may be taken by any group in the industry with the assurance that they will be effectively done. The N. E. L. A. Commercial Section at the recent convention reported the organization of three national campaigns for the promotion of industrial heating, electric ranges and electric trucks, and the operation of these campaigns is placed in the hands of the society. The society is also harmoniously functioning as the workshop of the Joint Committee for Business Development, providing the working staff and producing the printed matter which the joint committee divisions require. These activities are all being co-ordinated through the Advisory Publicity Council and good progress is being made.

Now comes the announcement that F. M. Feiker is to join the staff of the society, subject to special work which he is now doing for the United States Department of Commerce and for which he was reluctantly released by the McGraw-Hill Company. The further fact that W. E. Robertson, W. I. Bickford, N. G. Harvey and George E. Cullinan have joined the directorate of the society in the jobber group, George F. Morrison and H. D. Shute in the manufacturers' group, C. L. Chamberlain and W. A. Jackson in the contractors' group, and E. N. Hurley and E. W. Rockafellow as directors-at-large will add to the prestige of the S. E. D. as an industry institution.

It has taken a long time for the society to find its true place in the industry as a common, neutral workshop in the center of the various class associations of electrical men, available to serve them all. It has been hard to "sell" this conception of its function to the associations. Under the wise guidance of C. L. Edgar and W. W. Freeman, however, the dreams of J. Robert Crouse, that pioneer in co-operation, seem to be crystallizing in service of the most practical sort, with good promise of adequate financing to carry out the high hopes of those leaders of the industry who in 1913 organized the society, so confidently seeing in it an instrument of advancing the common interests of all classes of electrical men through commercial development.

## Beneficial Effects of Currents on Molten Metals

THAT metals melted in electric furnaces usually have better physical properties than those otherwise wrought has long ago been found out from practice, but all the "whys and wherefores" are not yet fully and clearly understood. If the exact nature of the action which produces this betterment were more clearly understood, it might be possible to increase, hasten or cheapen the production of these desired effects. In the June 16 issue of the ELECTRICAL WORLD Dr. Saklatwalla made some interesting suggestions concerning the possible effect on physical properties of metals. For steel the extremely high temperatures of the arc no doubt have some beneficial effect in producing greater fluidity, but the current itself, owing chiefly to the energy in the flux surrounding it, is now known to produce important useful effects by developing forces some of which were recognized and studied only within the last decade or two. By properly directing these forces they may, for instance, be made to produce an upward circulation which brings all the particles of suspended impurities and gases in turn to the surface, where they then remain or are caught by the slag, thus hastening and improving the slow and expensive "killing" process still in use.

When a current passes through a column of molten metal at sufficiently high current densities, one of these magnetic forces, known as the pinch effect, acts in a manner analogous to that of a centrifugal separator, forcing the better conducting materials to the central axis and thereby squeezing the more poorly conducting materials, like slags, oxides or gases, to the outside of the column. This force is shown strikingly by passing a sufficiently large current through a trough of mercury on which is floated an amalgamated copper rod—when the current is passed this rod instantly disappears, being sucked to the central axis. Vibrations produced by alternating magnetisms may, also, by the different inertias of different materials or by different induction

in heterogeneous masses, produce desired effects. When an iron bar is held over a trough of liquid metal through which a large current is passing, these forces will raise up the metal, forming the curious effect of a steady little hill of the liquid, which is sustained dynamically by a strong upward flow; if the iron bar is held below, the forces produce a depression which may break the circuit. A horizontal magnetic flux passing through such a trough from side to side in the proper direction produces the same effect as greatly increasing the gravity force on the better conductors, thus tending to separate the poorer conductors by causing them to float. A density of about 4 has in this way been given to water for concentrating minerals.

As iron at a red heat loses its property to add more magnetism to that of the current, one is apt to conclude that there is little magnetism around the current alone; but in furnaces in which the heating is desired the current densities may be made very great, and the kind of magnetism which is produced by the current alone is not destroyed by heat. Moreover, the energy in it increases as the square of the current; hence the forces which it could produce may become quite formidable. It seems that most of the wrought brass produced in this country is now being refined and made homogeneous by the proper application of some of these newer electromagnetic forces. The very thorough stirring which these forces may be made to produce when properly applied not only produces the much desired homogeneity of alloys, but doubtless also finer grains which deter segregation. Some of these forces have now been recognized, studied and applied; there may be others that have not yet been studied and are not yet described in textbooks. Human inertia in resisting the acceptance of new forces not included in the older "classics" is unfortunately very great, which makes progress slow and difficult. Besides the useful mechanical action of these newer forces, it is not at all unlikely that a current might also produce molecular or atomic effects, now that we know that the electron, with its strong electromagnetic and electrostatic forces and immense quantities of energy, plays such an important part in the constitution of the atom.

## A Chart for Line Regulation

WHEN an engineering problem is reducible to comparatively simple mathematics and when in the course of routine office work such a problem has to be solved a great many times for different numerical data, some one is sure to find a short cut in the form of a chart, a table, a specal slide rule, a mechanical device or something else. Most of these "first aids to the rushed" never leave the office in which they have originated. They may even remain in the notebook of the man who evolved them as part of his personal stock in trade. Now and then a public-spirited engineer gives to the profession at large the benefit of a short-cut method and thus scores for himself another point in the forthcoming argument with St. Peter.

Dr. Hutchinson's chart for a quick calculation of line-voltage regulation, published in this issue, commends itself because of the extreme ease with which it can be used, even by the proverbial "office boy." Its simplicity is due to a skillful arrangement of the two sets of curves and also to the fact that the line capacitance and leakage have been neglected. In other words, only the line resistance and inductance are taken into consideration. Of course, this limits the use of the chart to lines and other electrical devices where such a simplification of the actual conditions is permissible. With these limitations the shart should find its place of usefulness in the notebook of any engineer who deals with short transmission and distributing lines. It must be left to the engineer's judgment whether or not this chart should be used when the capacitance is also an appreciable factor. After all, sound judgment is one of the most valuable assets in an engineer, and if he lacks judgment, it may not be safe to intrust him even with a plain multiplication table.

## A Commendable Solution to the 40-Deg.-50-Deg. Controversy

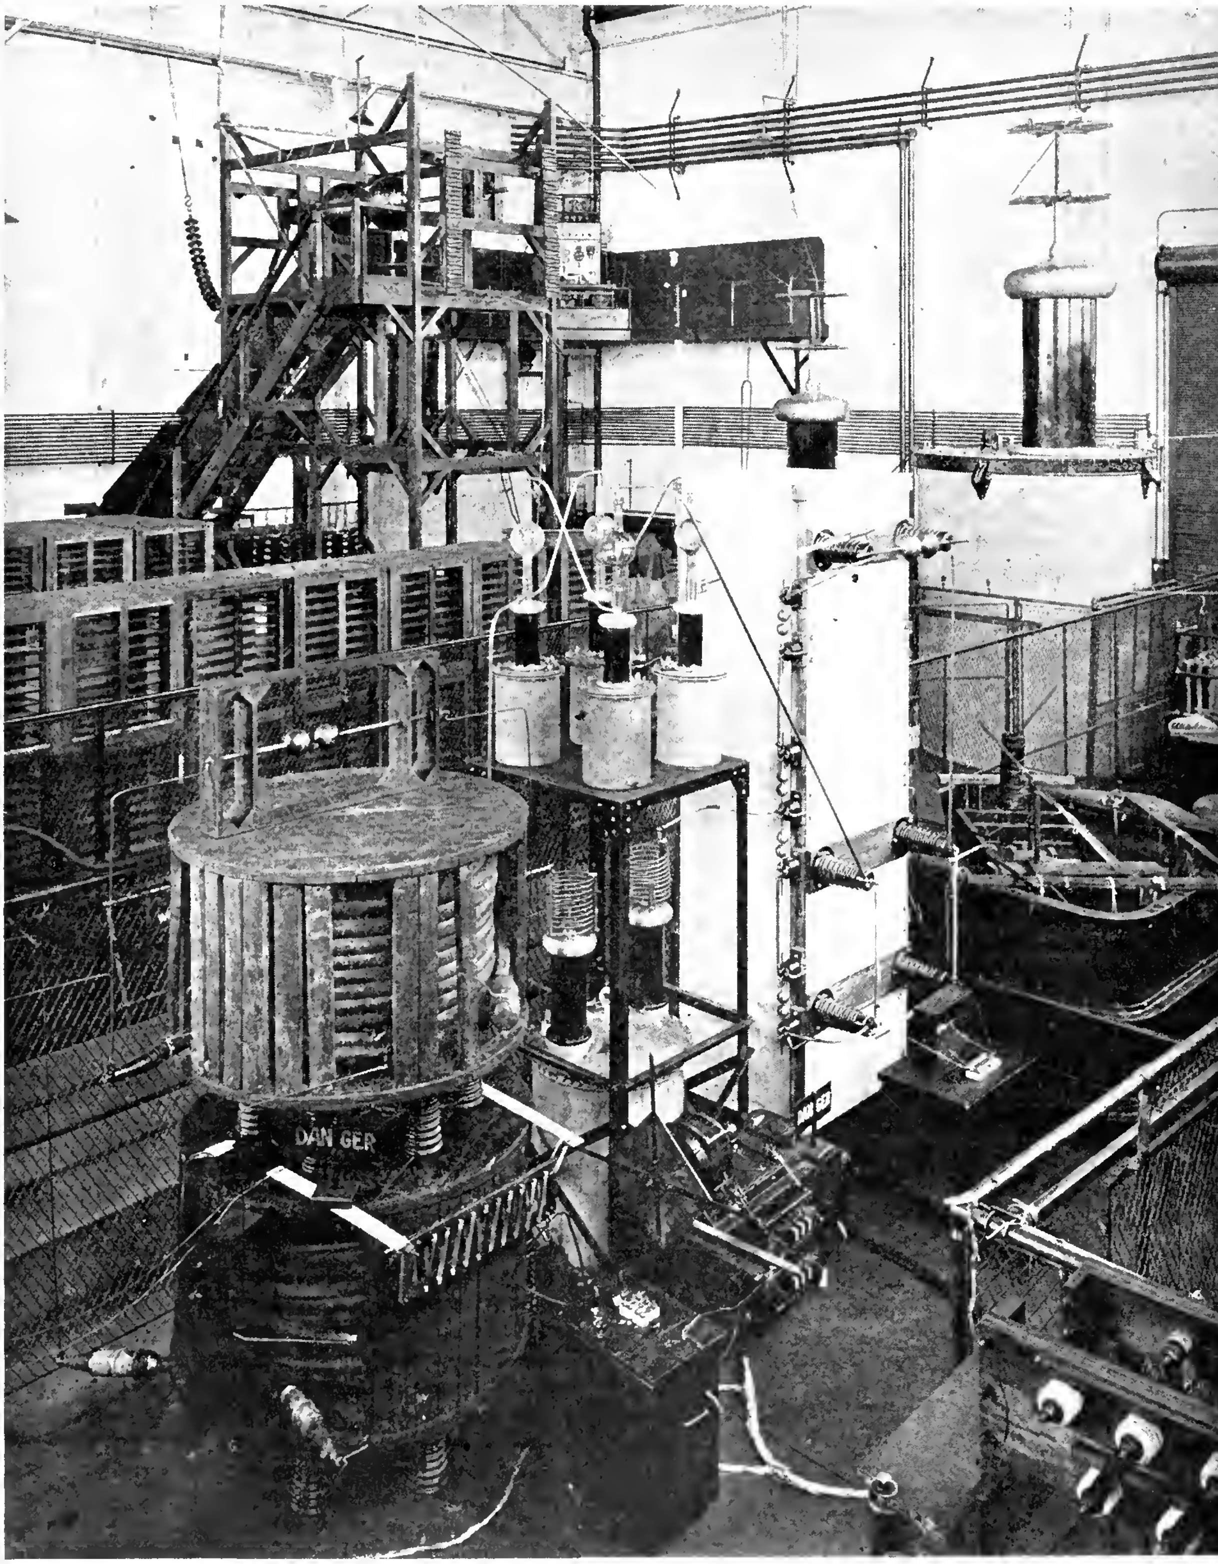
THE purchaser of general-purpose motors, as has repeatedly been pointed out in these columns, is interested primarily in knowing that "10 hp." means the same thing every time he buys a 10-hp. motor. That he will be so assured in the future is to be the beneficent result of the Electric Power Club's recent commendable action in abandoning its two standards of rating motors—one the 40-deg.-55-deg. double rating, the other the 50-deg. single rating—and in adopting as "recommended practice" the 40-deg. single rating without definite overload guarantee. This commercial-engineering question has been before the industry, not only nationally, but with international complications, for at least seven years. What particular solution was to be reached was not so important as that a single solution be reached. As was pointed out after the Geneva meeting of the International Electrotechnical Commission committees last fall, commercial experience seemed to dictate that the 50-deg. single rating was not the most workable. The newly recommended standard thus avoids a rating commercially difficult and at the same time provides a single rating without the complication of overload guarantees with given temperature behavior.

It should be noted with gratification that the new rating provides that the non-technical purchaser is assured of a generous motor—that is, a motor with a certain "reserve" capacity—and this is advisable. A technical user who fits his motor to his duty cycles demands temperature curves and other data, but the non-technical user, accustomed to factors of safety in other equipment, has his only protection in having a certain reserve to meet temporary emergencies. This assurance the 40-deg. single rating provides—and this apparently was the demand which made the Geneva conference decide that the 50-deg. single rating was not generally practicable commercially. At the same time, a single rating indicates a definiteness of behavior, which any standard of rating really should do.

The effect of the American decision on the ultimate international standard is, of course, not yet determinable. But it is to be hoped that not only the Power Club but also the rating bodies of other countries will follow the advice of the Power Club's board of governors and change from "recommended practice" for "adopted standard" the definition:

"An open-type general-purpose motor shall be capable of carrying full rated load continuously with a temperature rise not exceeding 40 deg. C."

# Laboratory Where Lightning Is Made to Order



MUCH comment has appeared in the newspapers recently regarding the "terrific" lightning bolts which have been produced artificially at the Pittsfield works of the General Electric Company.

In these manifestations of popular interest engineers will recognize the so-called "lightning generator" with which Steinmetz and Peek have been experimenting for some time. As shown herewith, the equipment consists essentially of a million-volt transformer (in the right background) and stacks of air-dielectric condensers (in the left background) which can be charged from the high-voltage transformer through the medium of kenotrons (on the elevated platform in the foreground).

So far voltages of two million have been obtained. With the condensers in use a large amount of power can be stored up and suddenly released with a very steep wave front.

# Automatic Substations in Mine Service

## Continuity of Service, Good Voltage Regulation, Minimum Wear of Equipment and Flexible Location Are Inherent Characteristics—Field of Application and Economic Comparisons with Manual Operation

By C. E. H. VON SOTHEN
*Power and Mining Engineering Department, General Electric Company*

THE automatic substation is becoming more and more widely used in mines for supplying direct current to the haulage system, cutting machines and pumps. The past year has witnessed a marked increase in the number of equipments sold and installed, principally because of the successful operation of stations previously put into operation. Articles describing some of these installations have been published, so that the method of operation of the automatic station has become quite well known. A discussion of the subject, however, from an economic and operating standpoint may be of assistance to those who have not had an opportunity to study it.

There are a few differences of opinion as to what constitutes an "automatic substation," but the term is generally understood to mean a station which, upon proper indication by a master element, goes into operation by an automatic sequence, maintains by an automatic means the required character of service, shuts down and clears itself upon the opposite indication of the master element, and protects itself while starting, running and shutting down. The master element may be a remote-control switch, time switch, contact-making voltmeter, etc., or the station may be started and stopped by switching the alternating-current supply. Because of the fact that the cost of electrical energy is usually only a few per cent of the cost per ton of coal or ore loaded for shipment, it is usually best to start the equipment in the morning by some device such as a remote-control switch and permit it to run continuously during the hours when it may be needed suddenly. The peaks of a mining load develop so rapidly that a machine usually does not have time, when started by a contact-making voltmeter or ammeter, to get up to speed and on the line in time to be of assistance. There are special cases, of course, where this method of starting may be used to advantage.

Although the cost of electrical energy is only a small part of the total cost of operating a mine, the service rendered by the electrical equipment must be of such a quality that the desired output of coal or ore may be obtained. This is what is meant by "the required character of service" and implies continuity of service and good voltage regulation. It is also important that the apparatus be subjected to the minimum wear consistent with good service and that the equipment be as simple as possible within the limits prescribed by good practice.

It has been found that, because of the elimination of the human element and the possibility of more advantageous location, the quality of service afforded by an automatic substation is better than that rendered by the ordinary manually operated mining substation and equal to that of the best. Most coal mines were operated only a few months last year so that results for a full year are not available, but automatic mining substations have had a severe test and have been found entirely adequate. A synchronous motor-generator equipment which has given very satisfactory service is illustrated in Fig. 3. The station is on the surface approximately 4 miles from the tipple and is started and stopped by a push-button placed at a convenient place on the main haulage. The direct-current feed lines and control wires to the push-button are taken into the mine through a bore hole. This station operates in multiple with four other stations, and the automatic equipment on the direct-current side was especially designed for the application. It consists of one section of load-limiting resistance and an automatic reclosing equipment. Each of these will be described later.

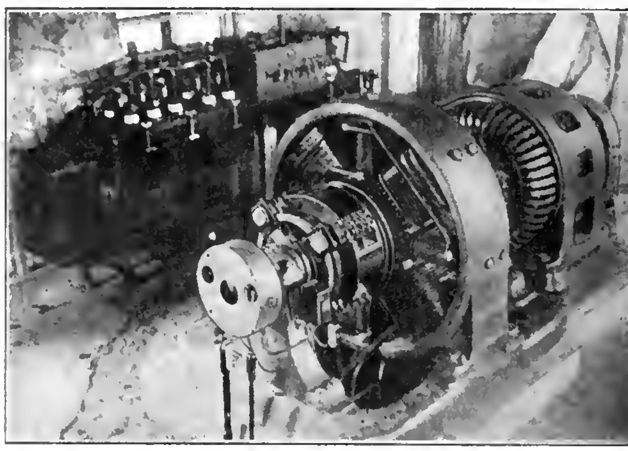


FIG. 1—AUTOMATICALLY CONTROLLED MOTOR-GENERATOR SET OF THE STAR COAL & COKE COMPANY

One of two 150-kw., 550-volt direct-current synchronous motor-generator sets with oil-immersed starting and running contactors and compensators installed at Red Star, W. Va. The set is equipped with speed limit device, bearing temperature relays and flash barriers for the generators.

Voltage regulation is of considerable importance from the standpoint of production, for low trolley voltage results in the slowing up of all the operations of the mine. Owing to their slower speed, motors have to carry overloads for longer periods and may eventually burn out, thus further hampering production. Good voltage regulation therefore has in itself a real economic value. While it was possible several years ago to maintain good voltage at the face by locating the substations near the working places, this has become practically impossible from an economic standpoint because of the great increase in wage rates. Consequently there has developed a practice of grouping the stations, placing one man in charge of several. This results in increased copper losses, increased voltage drop, a greater number of interruptions and longer ones, and an all-around poorer quality of service because one man cannot properly care for several stations.

When the load center is distant from all buildings or places where an attendant would regularly be stationed, an automatic substation, properly located, will save not only the copper and copper losses incident to long feeder runs, but also the wages of one or two operators. The direct-current distribution problem has been successfully solved in this manner at the Drifton colliery of the Lehigh Valley Coal Company.

The workings of this colliery are divided into several sections by the topography of the country. It was found that the haulage requirements of two of these sections could be supplied at 250 volts from a single substation without providing extremely large feeder capacity. In order that the substation might be at the approximate load center of the two sections, it was placed about 3,000 ft. from the nearest point at which an engineer was on duty every hour of a twenty-four-hour day, this man being in charge of a slope hoist. An automatic synchronous-converter substation equipment was installed in such a way that it might be started and stopped from the hoist house by means of a remote-control switch and pilot wires. Two direct-current feeders run in opposite directions from the station to the two sections of the mine, being carried through bore holes at the points where they tie in to the trolley.

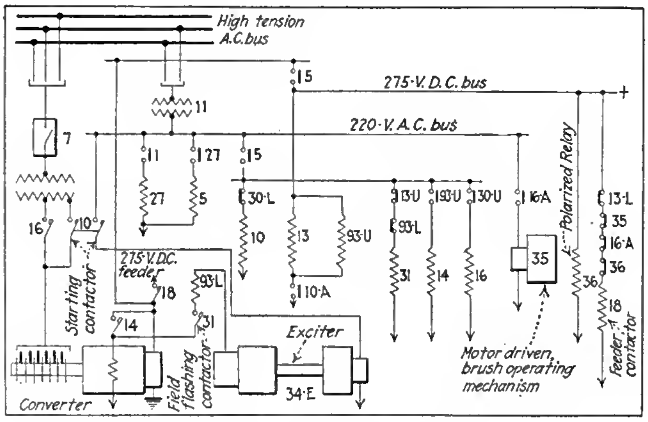

FIG. 2—SIMPLIFIED DIAGRAM OF AUTOMATIC CONTROL FOR MINING CONVERTERS

Assuming the incoming alternating-current lines to be energized and the manually operated oil circuit breaker No. 7 to be closed, closing master starting element No. 1 causes relay No. 27 to close its contacts. This picks up control contactor No. 5, which in turn energizes and closes starting contactor No. 10. This connects the converter to the low-voltage taps on the secondary side of the power transformer; it also connects the motor of the small exciter set, 34E, to the 220-volt alternating-current control bus. Relay No. 13, which is connected across the converter commutator, will pick up only on direct voltage and therefore does not close its upper contacts until the machine reaches synchronism.

When relay No. 13 picks up, it closes field-flashing contactor No. 31, connecting the converter shunt field to the small 250-volt exciter. This connection is maintained until the voltage across the commutator and the flashing current are in the proper direction with respect to each other, as determined by relay No. 93. Proper polarity is therefore assured and the polarizing takes a maximum of only three or four seconds. Relay No. 93, in picking up, drops out contactor No. 31 and closes contactor No. 14, thus self-exciting the machine. At about one-half normal field current relay No. 30 closes its contacts, dropping out starting contactor No. 10 and closing running contactor No. 16. The brushes are next lowered on the commutator by the motor-driven brush-operating mechanism No. 35. Relay No. 36 is a polarized device for verifying the converter polarity, and until it has closed its contact feeder contactor No. 18 cannot close. When the relays of the automatic reclosing equipment indicate proper conditions, contactor No. 18 connects the converter to the 275-volt direct-current feeder.

### Protection Against Overloads

When several manual substations are interconnected on the direct-current side through a trolley or distribution system, the loads may, of course, shift about in such a way as to overload a substation and trip its direct-current circuit breaker. This throws the entire load on the remaining stations and may in an extreme case so heavily overload these stations that their direct-current circuit breakers may open successively. If these breakers do not trip, the stations will continue to supply load, but through such a long length of trolley and feeder that the voltage drop will be excessive. Equipment is available for use with direct-current circuits which permits a station to limit its own load by temporarily inserting one or more blocks of resistance into the feeder, depending upon the amount of overload. Only the excess load is shifted to the other stations, thus providing the greatest continuity of service and best voltage at the working places. Such a "load-limiting" equipment may be applied either to a completely automatic substation or to one which is manually operated on the alternating-current side. Two equipments of the latter type have recently been furnished the Quemahoning Coal Company at Somerset, Pa., for use with 150-kw., 275-volt synchronous motor-generators. One of these is shown in Fig. 4.

Another form of protection for the direct-current side consists of the automatic reclosing equipment. This may be either of two kinds—that for operation independent of any other direct-current source (stub-end feed) or that suitable for either stub-end or multiple feed. In general, these equipments fulfill the following functions:

1. They disconnect the load from the source of power in case the voltage fails or the load exceeds a predetermined value.

2. The load remains disconnected a definite minimum time interval of ten to thirty seconds, regardless of the cause of the opening.

3. At the expiration of this time interval they immediately reconnect the load to the source of power, provided the voltage is restored or the connected load is reduced to a predetermined value. There is no attempt to reclose as long as a short circuit or excessive load remains connected.

The principal advantage of such an equipment over the ordinary manually operated breaker is that it will reclose promptly when conditions have settled down to normal.

The only way in which an operator can tell whether an overload or short circuit has been removed is by trying the circuit out by reclosing his breaker. After several attempts he will usually wait a considerable length of time before trying again, very often causing delays that might have been avoided by the use of the automatic reclosing equipment. The contactor of such an equipment cannot very well be held in by hand during an overload, so that the machines are more fully protected.

### Automatic Operation Can Reduce Maintenance Due to Poor Handling

The greater the degree to which a station can be made automatic, the less will be the wear and tear on the apparatus due to unskillful handling. Because of the present labor shortage, it is more difficult than ever to obtain trained substation operators at the mines, except at very high wages. The result is that the apparatus is more or less abused. Bearings are burned out, circuit breakers are held in during peak loads, resulting in flashovers and burn-outs in machines, and the stations receive little care. If the station is automatically controlled, one trained man can give part of his time to

proper inspection and care. Casual inspections can usually be given daily, but a thorough inspection, during which the various devices are operated by hand, should be given once each week.

In order that the adjustment and operation of these stations may be thoroughly understood by the mine electrician, the automatic equipments have been simplified as much as is consistent with proper operation and protection. In the latest types of control for both motor-generators and synchronous converters for mining service all of the steps in the sequence are performed by relays which respond only to certain electrical conditions. Each switching operation is a direct function of the electrical condition of the apparatus at the particular moment and is dependent upon the proper functioning of the preceding operation. The starting sequence followed for both motor-generators and converters is the same as that considered best practice in manual operation.

## Sequence of Operations

A simplified diagram of the automatic control for synchronous converters for mining service is shown in Fig. 2. It does not show all of the interlocks and protective relays included in a complete equipment, but only the devices necessary for proper starting sequence.

The standard equipments for both synchronous motor-generators and converters include protection against the following: (1) Severe alternating-current or direct-current overload. (2) Failure to complete starting sequence. (3) Loss of excitation. (4) Single-phase starting and undervoltage on incoming line. (5) Overheated bearings. (6) Overheated machine windings. (7) Temporary drop in incoming voltage. (10) Reverse power, if the station is operating in multiple with another. (11) Overheated load-limiting resistors (when these are used).

As an example of the rapidity with which the automatic reclosing equipment will operate, it may be stated that in at least two instances it has opened in time to clear a machine when a short circuit was applied to the feeder immediately outside of the station and not more than 25 ft. from the machine. One of these machines was a 275-volt synchronous converter at the mine of the Carbon Fuel Company, South Carbon, W. Va., and the other a 550-volt generator at the Star Coal & Coke Company's mine, Red Star, W. Va. The latter machine was equipped with flash barriers, as shown in Fig. 1. The view also shows the starting and running contactors for the motor and one of the bearing temperature relays. The flashing in each case was so slight that the commutator did not require any attention. In a few instances bearing temperature relays have operated and have always cut the machine off before any damage has resulted. Only a small amount of scraping has been required in order to put the bearings back into condition for use. Wherever the equipment has had proper inspection and care the protection and operation has been most satisfactory.

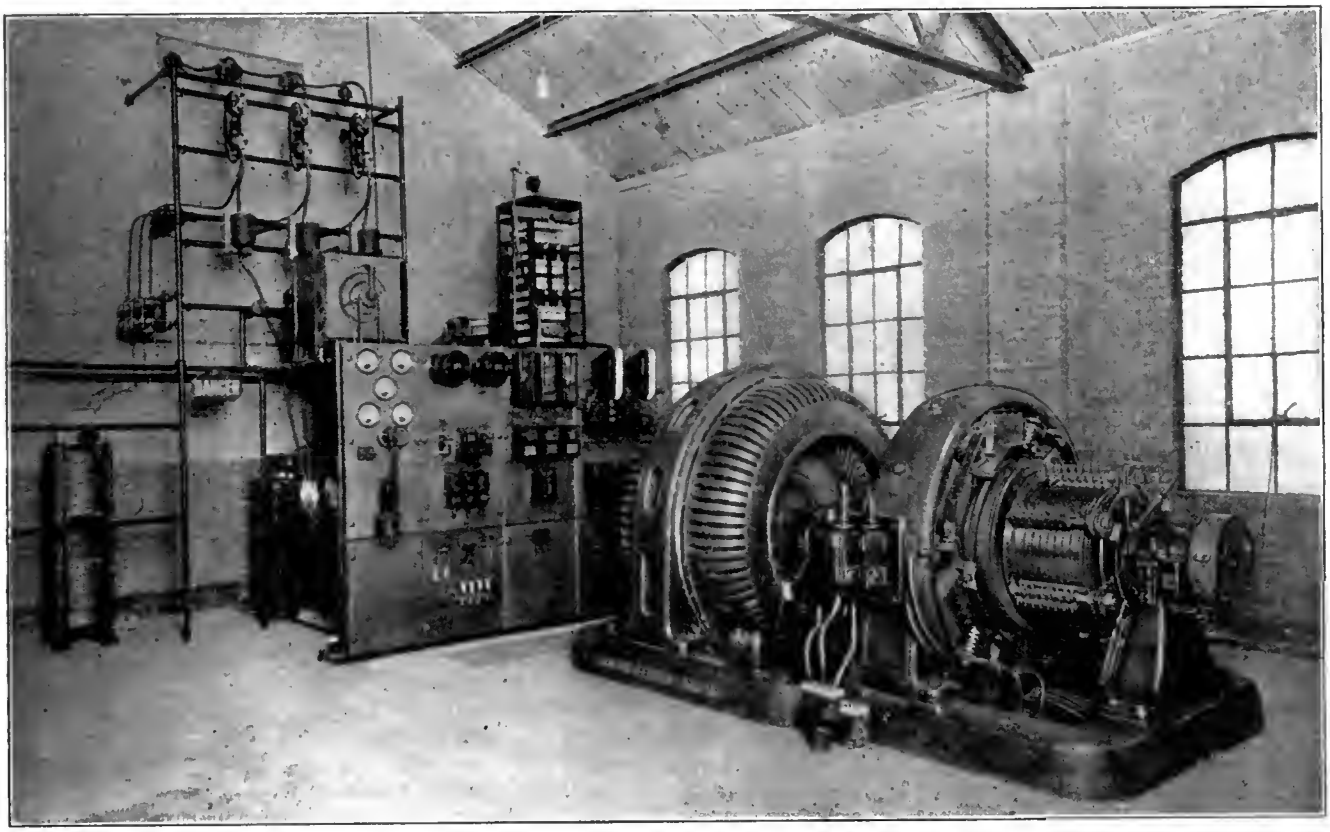

FIG. 3—SYNCHRONOUS MOTOR-GENERATOR EQUIPMENT OF CLEARFIELD BITUMINOUS COAL CORPORATION
The set is rated at 300 kw., 250-275 volts, direct-current, and 6,000 volts, three-phase, 60 cycle, on the alternating-current side. The installation is at Rossiter, Pa.

The protective features are of two kinds—automatic-reset and hand-reset. If the trouble is likely to be of a temporary nature such as overheated machine windings, low alternate-current voltage or overload on the direct-current side, a device is used which will automatically reset when conditions have returned to normal. If the trouble is likely to be of a permanent nature or such that the station should be inspected or repairs made before service is restored, a hand-reset device

is used to give the protection. Examples of this kind of trouble are overheated bearings, loss of excitation and failure to complete the starting sequence. The individual devices are in most cases provided with their own lock-out features, so that it is a simple matter to determine why the station has been shut down.

### Field of Application for Automatic Mine Substation

While the automatic substation has distinct advantages over the manual substation, when properly applied, there cannot always be found a justification for its use. There are, of course, no engineering reasons why an automatic substation cannot be used wherever a manual substation will operate satisfactorily and without an undue amount of attention from the operator, but there are quite a few places where the extra investment would be entirely unwarranted. For instance, the workings of

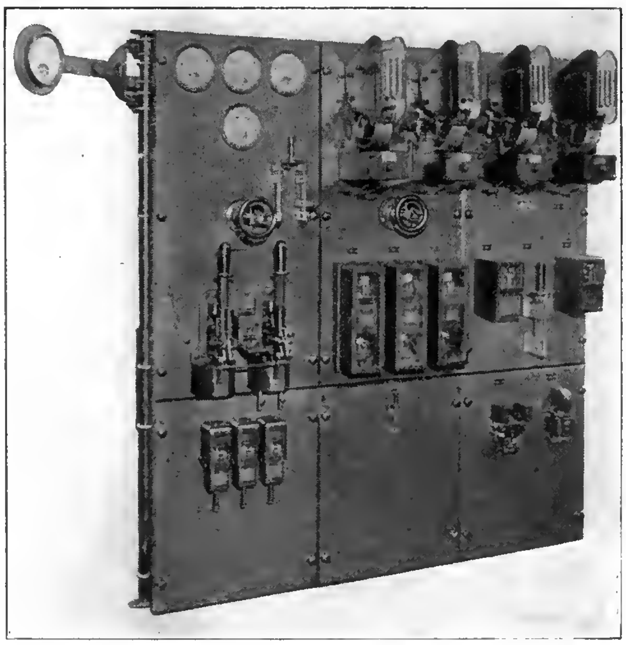

FIG. 4—AUTOMATIC SWITCHING EQUIPMENT OF QUEMAHONING COAL COMPANY, SOMERSET, PA.

Control panels for 150-kw., 2,300-volt, 60-cycle motor-generator set and load limiting equipment for the 275-volt, direct-current feeder.

some mines are so situated that large amounts of power are required in a comparatively small area so that long feeder runs are unnecessary. In such cases there may be advantages to be gained by placing two, three or more machines in the same station, in which case the price of automatic control would be entirely out of line with the saving to be gained by eliminating substation operator.

Again, there are any number of mines at which the substations can be so located that the same man can care for the station and a fan. In other cases the station may be in the same building in which there is located a hoist or shop, so that no additional attendant is required.

However, there are times when the hoist operator or blacksmith is so busy that he cannot give the station proper attention. This often occasions such delays that automatic control, or at least certain automatic features, might well be installed, in order to increase the output of the mine. The increased revenue would then soon pay for the extra investment.

In order that a general idea may be obtained as to the relative total costs of a manually operated and an automatic substation, the following comparison is given. This is based on a 200-kw., 275-volt, direct-current-2,300-volt alternating-current synchronous motor-generator equipment. Assuming the total first cost of the manually operated station to be 100 per cent and referring each item of cost and operation of both the manual and automatic station to it as a base, there results approximately:

| | Manual | Automatic |
|---|---|---|
| | Per Cent | |
| First cost of apparatus | 72.8 | 111.8 |
| Cost of building | 11.8 | 12.4 |
| Installation (material and labor) | 15.4 | 18.4 |
| Total first cost | 100.0 | 142.6 |
| Excess first cost of automatic over manual | .... | 42.6 |
| Annual fixed charges | 20 | 28.5* |
| Annual attendance charge | 25‡ | 2.5† |
| | 45 | 31.0 |

* 0.20 × 142.6.
† 0.10 × 25.
‡Based on an attendance charge of $1,700 per year.

The annual saving of the automatic over the manual is therefore 14 per cent of the total first cost of the manual station. Dividing the excess first cost of the automatic by the annual saving (42.6 ÷ 14), it is seen that the extra investment is paid for in three years. After such time the annual saving will amount to about 33 per cent of the extra investment. If an operator is employed for more than one shift the saving will be greater.

Though the relative percentages will vary depending upon the locality, those given are considered a fair average. The comparison does not include charges for power or repairs. The former will be virtually the same for either manual or automatic and the latter are negligible. Account has been taken of the fact that a slightly larger building is required for the automatic control, but this would usually be compensated for by the fact that a more substantial building and a suitable method of heating are required if an operator is to be maintained. Consequently the figures might be made more favorable to the automatic.

The conclusion may therefore be drawn that, while there are many cases in which an automatic station is not justified, there is no question about its economy when properly applied. Whenever additional substation capacity is required, the whole situation should be given careful thought in order that the best procedure may be followed.

## Only Seven Water-Power Generating Plants in Great Britain

A TOTAL of 536 public generating stations in Great Britain is shown by the report of the "Electricity Commission" for the year ended March 31, 1922. Of this number 366 utilized steam as a source of power, fifty-five produced gas, forty-seven oil engines, and the remainder other means, including water power. The electrical division of the United States Department of Commerce states that only seven British stations depend exclusively upon water power, the largest of which produced 18,763,000 kw.-hr. out of a total of 29,107,000 kw.-hr. generated from this source. The total electric power generated during the year 1921 amounted to 4,844,666,038 kw.-hr., of which steam supplied power for approximately 97 per cent.

# Periodical Inspections Maintain Service

### Three Forms and Inspection Scheduling Cards Control Equipment Maintenance in Plant of 65,000 Kw.—Records Aid Accounting

BY R. D. GILLESPIE
Chief Engineer Millers Ford Plant, Dayton (Ohio) Power & Light Company

GOOD electrical service can be rendered only with good equipment which is maintained in first-class condition. To maintain equipment in good condition it is very necessary to outline a definite program of routine inspection and repairs covering all of the equipment in a station and also to keep records and costs of the inspections and repairs on each separate piece of apparatus.

Such a system is in use at the 65,000-kw. Millers Ford station of the Dayton Power & Light Company, Dayton, Ohio, covering routine inspections, repairs, maintenance costs and record keeping of each separate piece of equipment in the station, including all auxiliaries. The forms were prepared to get the desired information by the most direct and economical route, and the system is kept in operation by two men.

The records and maintenance costs are kept on the unit plan, giving the cost of maintaining each unit of equipment as a whole or its parts. For example, the costs of maintaining one of the turbine units would have as subdivisions the turbine, generator, condenser and condenser auxiliaries. The maintenance costs for the condenser auxiliaries would be further subdivided to cover each piece of apparatus in that group.

An operating record, the turbine room log sheet (Fig. 1), is kept on the turbine unit and shows the hours operated and whether the unit was out of service, available or undergoing repairs. Records and maintenance costs for the boiler units are kept in the same way. The boiler-unit records are further subdivided into boiler, furnace and stoker, and the furnace repairs are again subdivided to cover front wall, bridge wall, right and left side walls.

Boiler operating records are also kept covering the hours of steaming (Fig. 2), the banked time and the number of hours out of service while repairs were being made to either the boiler, furnace or stoker. This record also shows the number of pounds of steam generated daily by the boiler, the number of pounds of coal burned, the steam and flue-gas temperatures, the percentage of $CO_2$ and the boiler efficiency. This is a cumulative record which gives the totals and averages for any date in the month, together with a total and average at the end of the month. The yearly records are kept in the same way by monthly periods. This information is especially valuable when comparing the operation and maintenance costs of one boiler unit with those of another.

#### CARD FILE CONTROLS INSPECTION DATE

Inspections are handled in the following manner: A calendar card file has been prepared which has a space for each day of the year. The file is further separated into months with divisions for each day of the month for convenience in finding dates. The dividers for the months are of different color from those for the days. Then a typewritten inspection card (Fig. 3), 4 in. x 6 in., is kept for each unit in the station and the subdivisions of that unit. This card is headed with the name and number of the unit, and it states what the inspection is to consist of and how frequently inspections are to be made. As these dates are reached the inspection cards are withdrawn from the file and work orders (Fig. 4) are issued to the foreman in charge of the repair force. These work orders state what is to be done, when the work is to be started and when it is to be completed. The inspection cards are then returned to the file and set ahead to the date when the next inspection is required.

A carbon copy of all work orders issued is kept in the chief engineer's office and checked off when the original is returned. When the inspection or work covered by the work order is completed, the foreman turns the original into the office and places on it the name of the workmen together with the number of hours each man worked. To keep in touch with the work covered by work orders, the carbon copy is used to follow up on the original order if the work is not completed on schedule time. The copies are checked over daily, and if for any reason the foreman has failed to complete the work or has forgotten to turn the work order in on the date given him on his work order to complete that work, the copy of this order is handed to the chief engineer. He in turn gets in touch with the foreman in charge of the work and finds out the reason for the delay.

#### WORK ORDERS ISSUED ON ELECTRICAL INSPECTION

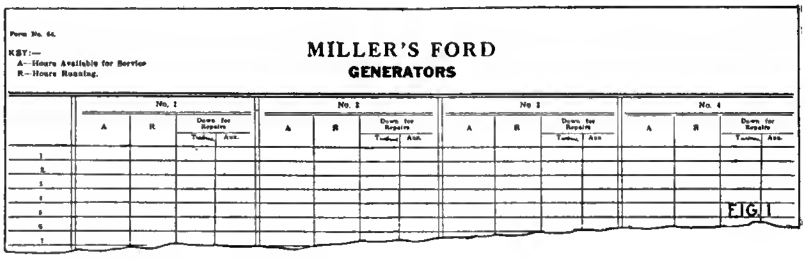
The inspection and maintenance of the electrical equipment, such as oil circuit breakers, motors and transformers, are also taken care of by work orders in the regular way. The oil circuit breakers are inspected at regular intervals. The switch contacts are inspected and repaired if necessary, the oil filtered and a breakdown test given to it. All adjustments are checked, after which the switch is opened and closed a few times to see that it functions properly. An operating record is also kept of all the oil circuit breakers that open automatically, and if any opens automatically more than a given number of times because of short circuits or overloads the switch is taken out of service. The contacts are then repaired, the oil is filtered and tested, and the switch is restored to its normal condition, regardless of whether this falls in the regular routine or not.

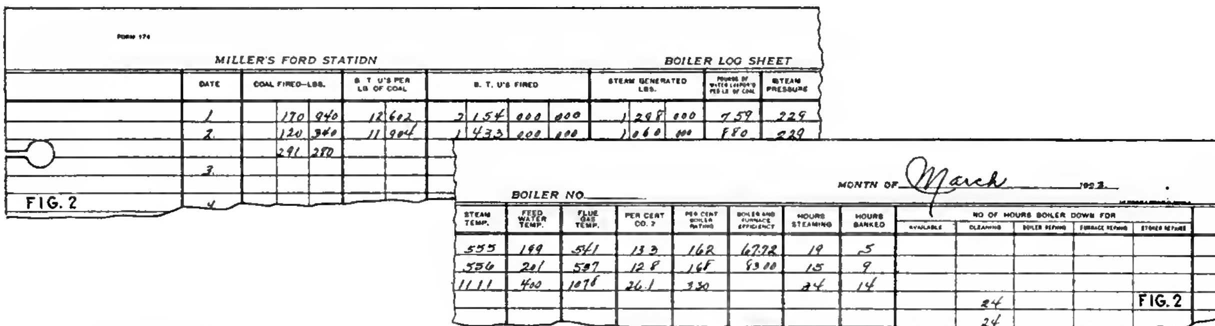
At regular intervals a sample of oil is taken from each transformer and subjected to a breakdown test. If the test shows the oil to be deteriorated, it is run through an oil drying and filtering machine a sufficient number of times to restore it to its original condition. This method has been in use for the past three years, and during this time there have been no transformer failures due to deteriorated oil.

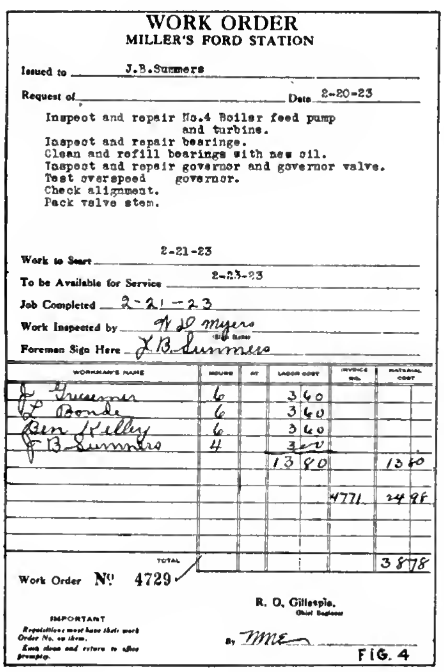
Motors are also inspected at regular intervals. The small motors on the governor control of the main turbines get just as regular attention as the large motors on the condenser circulating pumps. Boiler and furnace inspections are handled on special forms that outline a very thorough inspection. Work orders are issued to cover repairs that are shown by these reports to be necessary on the boiler, the furnace or the stoker.

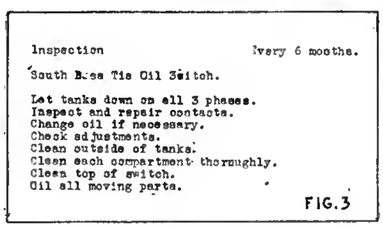
Whenever material is required for making repairs, the foreman issues a requisition (Fig. 5) on the storeroom with the work-order number on the requisition for the material. From this requisition the storeroom man issues an invoice (Fig. 6) covering the material

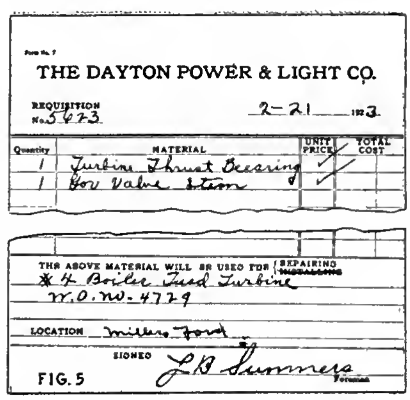
issued, giving the distribution and the work-order number. This is sent to the office, where the cost of the material is put on the invoice numbered and filed. The cost of the material, the invoice number and the labor costs are then transferred to the original work order. The work order is now complete and gives the total cost of the job in labor and material. It also is always carried on the same page number; that is, when a sheet is full it is withdrawn from the book, numbered and then filed. A new sheet is then inserted, having the same page number but with the next higher sheet number. Labor costs are entered daily in the labor distributing book direct from the workman's time card. Material costs are taken from the purchase

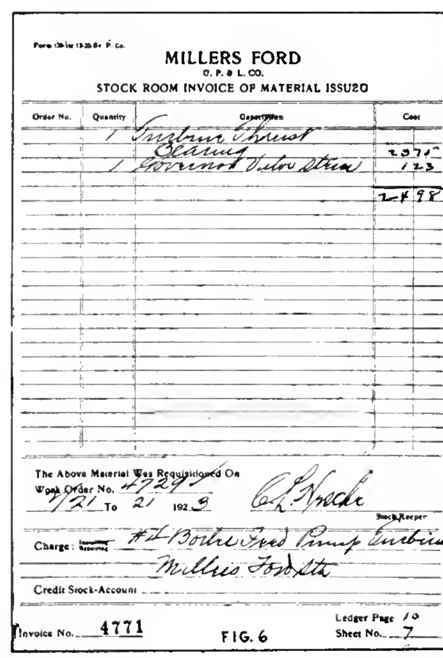












RECORD FORMS THAT FACILITATE INSPECTION AND MAINTENANCE

Fig. 1—Turbine log sheet, giving hours of operation for both turbine and auxiliaries.
Fig. 2—Boiler-room log sheet has space for complete data on boiler operation.
Fig. 3—Typical inspection cards determine date of overhauling besides giving specific instructions for necessary inspection.
Fig. 4—The work order authorizing repair of inspection work also contains the itemized costs of labor and materials.
Fig. 5—The requisition for stock issued by the foreman against the storeroom.
Fig. 6—The stock-room invoice record lists the cost of the materials which have been issued.

indicates when the job was started, when completed, the number and names of men working on the job and the foreman in charge of the work. The work order is then filed under the proper heading in a file provided for that purpose. Work orders are used for all work other than routine work in the station and machine shop.

Maintenance costs are entered in two loose-leaf books having ten ruled column pages, one book being for distributing labor costs and the other book for distributing material costs. For convenience the same account orders and from the storeroom invoices. The distribution books are totaled at the end of each month so that the results make up the monthly maintenance-of-equipment cost sheet, which in turn becomes a part of the monthly manufacturing-cost statement. The monthly totals are then carried to the summary book, which has a column for each unit for labor, material and total cost by months. This book also shows at any time the cost of maintaining any one unit or its subdivision for any given period desired.

# Uniformity in Demand Rates*

## Diversity of Form and Application Makes Standardization Desirable—Characteristics of Meters, Load and Duration of Peaks Have Marked Effect on Registered Demand — Comparison of Time Intervals

By W. M. CARPENTER
*Engineer Empire State Gas & Electric Association, New York City*

METHODS of measuring demand in electric rates show a great diversity in form and application among central-station companies and in an effort to bring about a greater uniformity of practice the Empire State Gas and Electric Association last year formed a committee to investigate the possibilities of standardization. Although this committee is not yet ready to report or make recommendations, it has nevertheless developed a great deal of interesting information and much valuable data. The work of the committee has been directed principally at the general proposition of the measurement and rating of demand rather than the technical features of the meters themselves.

The course of procedure followed by the investigation has included:

First—A tabulation of all demand rates now in effect throughout the state.

Second—A questionnaire to a group of the larger companies, containing the following inquiries:

1. Should the demand charge be stated in the rate as a yearly or a monthly charge?
2. Should the demand charge be based on the yearly peak, or should each month's or each week's bills be based on the monthly or on the weekly peak?
3. If the charge is based on the yearly peak, what constitutes the year; *i.e.*, is the calendar year or the contract year to be used as the basis?
4. What time periods should be used as the basis of demand charge for different situations; *i.e.*, when, for example, should a one-minute, a five-minute, a fifteen-minute or a thirty-minute peak be used?

Third—A collection of typical load curves for industrial plants, in order to discover, if possible, the load characteristics of the various industries.

Fourth—A survey of the metering devices now on the market.

At this point it should be noted that the influence of power factor has not been considered at all, and that the handling of this particular phase of the question has been reserved for a future study.

During the investigation it was found that there is a great diversity in the methods employed by the various companies in connection with their demand rates. There are on file in Albany and New York over one hundred rates, of which hardly five are alike. The time interval varies from an "instantaneous" reading to one hour. Some companies carry the demand, once established, over a period of an entire year; others carry it for a month; a few special cases are for a week only. Some companies, in a happy uncertainty, do not define "demand" at all; others compute it, not from the readings of recording or indicating instruments, but as a percentage of the connected load, and here also there is a wide range of practice.

Due consideration should be given to the fact that the situation must be viewed both from the engineering and from the commercial standpoints. It is a problem which interests equally the commercial, the meter and the engineering departments of the power company. Much of the business affected by demand rates is obtained in competition with private plants. The manufacturer always has steam boilers in his factory, and it is not such an enormous step to increase his equipment a little and install an electric plant in addition. If the manufacturer thinks that he can make electricity more cheaply himself, he certainly will do so. The scores of isolated manufacturing power plants within the limits of the larger cities of the state bear abundant witness to this fact. The large consumer, usually having at least a boiler house, sometimes even generating machinery of his own, is often in a position of considerable independence and can bring this additional factor to bear upon the question.

For this reason the purely engineering considerations

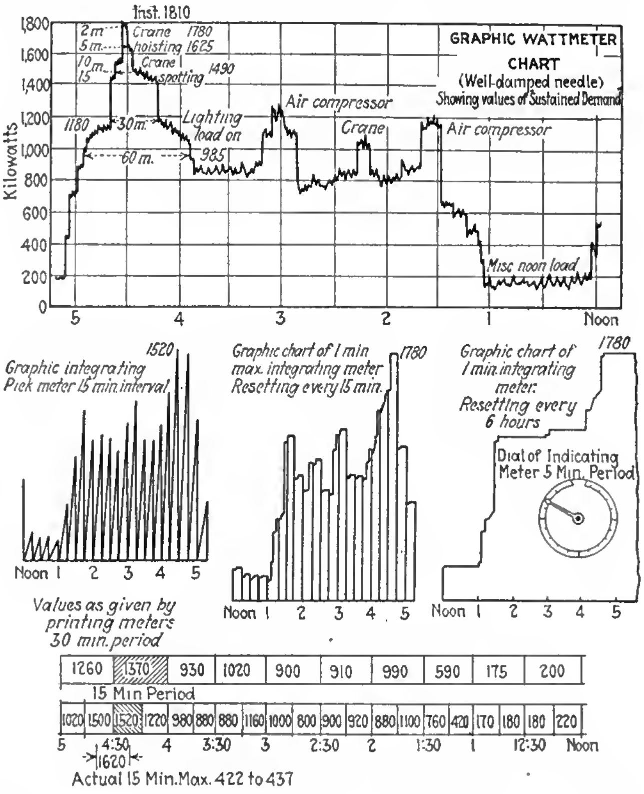


FIG. 1—TYPICAL LOAD, FOUNDRY WITH CRANE, SHOWING VALUES OF DEMAND AS DETERMINED BY VARIOUS METHODS

*From a paper presented at the winter meeting of the Electric Meter Section, Empire State Gas and Electric Association, at Syracuse, N. Y., Jan. 22, 1923.

are often modified so as to obtain a piece of business for which special provisions must be made.

The fundamental difficulty of the whole subject appears to center in the time interval, and while many arguments have been submitted in favor of each particular unit of measurement, the great majority of rates are based on questions of policy rather than upon scientific or engineering facts. The entire question is influenced by broad considerations of rate making, but it is desirable to note what great difference in the size of the customer's bill will be caused by various methods of measurement.

Fig. 1 represents the graphic wattmeter chart of a typical afternoon's work of an iron foundry. In the load there are included, besides the usual tumbling barrels and miscellaneous machinery, a 250-hp. air compressor and an electrically driven crane. When all these happen to operate at once at a time when the evening

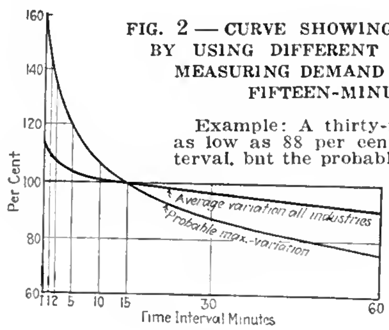

FIG. 2 — CURVE SHOWING VARIATION OF RESULTS BY USING DIFFERENT TIME INTERVALS FOR MEASURING DEMAND AS COMPARED WITH FIFTEEN-MINUTE INTERVAL

Example: A thirty-minute interval may show as low as 88 per cent of the fifteen-minute interval, but the probable average of all industries will be 97 per cent of the fifteen-minute reading. An instantaneous interval may be as much as 160 per cent of the fifteen-minute period, but the probable average of all industries will be 116 per cent of the fifteen-minute values.

lighting load is also on, a peak of considerable size is formed. From this chart it is easy to determine how the various time intervals will affect the amount of the so-called demand. If the "sustained" peak is used as the basis of measurement, the demand found will be lower than that where the "integrated" peak is used and the unit price will have to be raised accordingly. The sustained peak may be defined as that portion of the curve during which the indication remains at its highest value for the duration of the required period of time. While the use of this quantity—in that it cannot exceed the true maximum integrated demand—will usually meet with the customer's entire approval, it is very unfair to the electric company because the value cannot be higher than the minimum point of any depression which may occur during the period. In addition, the depth of the instantaneous minimum as drawn by graphic instruments depends largely upon the amount by which the meter movement is damped. It is also possible for unscrupulous customers to install artificial interrupting devices which will cut off the current long enough to let the meter needle drop and then pick it up again.

From the chart it is evident that a sixty-minute sustained demand will only show 985 kw., while a fifteen-minute period will give 1,400 kw. and a two-minute one will give 1,780 kw.

Similar—though not so extreme—differences are shown by various methods of integration, which give either the actual total or else the average kilowatts used in any period of time. To the left below the wattmeter chart is shown how the curve might look on a graphic integrating meter of the "Piek" type, which resets on a fifteen-minute period. This would show 1,520 kw. A one-minute maximum integrating meter would show 1,780 kw., while a five-minute period would give 1,670 kw.

In the same way the readings given by the various printing meters, or "printometers," would show wide divergences. A thirty-minute period would give 1,370 kw. between 4 p.m. and 4:30 p.m. A fifteen-minute period would show 1,520 kw. between 4:15 p.m. and 4:30 p.m. In these meters there is an added disadvantage that because the time periods are selected by a clock no cognizance is taken of load conditions immediately before or after the interval. Thus, in this particular case, if the clock were seven minutes slow, it would show the real peak from 4:22 p.m. to 4:37 p.m. at 1,620 kw.

Numerous attempts have been made to develop a meter which will overcome this selective characteristic, but as yet they have not found sufficient favor to justify their widespread operation.

A type which has found much use is the so-called "lagged" type, which is really an indicating meter in which a retarding device is used so that some definite period must elapse before the full value is indicated. This retarding device may be either mechanical or thermal, and the time interval is independent of any clock. In all of these, however, the demands shown will differ by an amount which depends upon the particular type of instrument and upon the character of the load curve. With a nearly steady load all instruments of this class will show nearly the same value as the integrating meters and give a very close approximation of the actual demand, but with a fluctuating load each type will give a different result.

This brings us to the second phase of the problem, namely, the effect of the characteristic load curve of the industry upon the size and duration of the peak. Industries vary widely in the manner in which they use electricity. In some limited instances, such as flour mills, electro-chemical industries and an occasional pumping plant, the curve is so regular as to make all considerations of the length of the peak unnecessary. In all others, however, a more or less irregular use of energy is necessary, and as the plant operations become more and more irregular and tend more and more toward the use of heavy machinery, some differences between the peak and the average use becomes inevitable. This is particularly true of heavy, concentrated work, such as is found in rolling mills and stone crushers and in all processes where there are sudden heavy loads, poorly compensated for by insufficient flywheel capacity.

To investigate this, there were collected the graphic wattmeter charts of forty typical industries, selected at random as showing an ordinary day's work and not supposed to represent either the maximum day or the maximum peak. From these the peaks were selected and a tabulation was made up showing the relation of the values found by using the various time intervals. The results of this tabulation showed that:

(*a*) The "sustained demand" as the basis of measurement bears very little relation to the real demand.

(*b*) As a general rule, the shorter the length of the time interval the lower should be the unit price per unit of demand.

(*c*) The sixty-minute peak rarely represents the use of electricity except in the case of two or three industries with exceptionally steady load characteristics.

(*d*) The "maximum momentary demand" is largely dependent upon the damping of the needle of the meter.

(*e*) It appears to be a matter of great difficulty to find a combination of equitable time interval and a suitable meter which will show the demand of all the industries of a community with absolute accuracy. Apparently the fifteen-minute peak comes as near as may

reasonably be expected to representing the actual demand. It was found that the results from two-minute peaks were seldom more than 10 per cent above and those from thirty-minute peaks more than 5 per cent below the results arrived at by using a fifteen-minute interval.

It is evident that the selection of the measuring devices should follow rather than precede the assignment of the time interval. It appears, however, that in a great many cases, particularly among the smaller electrical companies, this procedure has been reversed. Central stations in many instances have adopted a particular type of meter and then have tried to apply a particular rate for this meter.

In conclusion, it must always be remembered that the actual measurement of demand is still in the development stage, and that there is yet a vast field ahead of it. This is especially true in regard to the phase which we all approach with fear and trepidation—the influence of the power factor. It is expected that the recent great progress which has been made in the development of the kilovolt-ampere meter will lead to the determination of true electrical demand without recourse to all the mathematical gymnastics which are now necessary where the element of power factor enters into the bill.

It is expected that the committee which has this problem in charge will develop a set of standards which will more nearly co-ordinate the present great diversity of practice which exists in this field.

# Electric Drive Found Best for Ice Plants*

## Its Use Almost Universal in New York City—Less Skilled Attendance Required than with Other Methods—Comparative Production Costs with Various Kinds of Driving Equipment

By J. R. McCOY
*Assistant Commercial Manager Texas Power & Light Company*

WHEN power can be obtained at a rate which compares favorably with the fuel costs prevailing in a particular locality, the motor-driven plant is the wise selection, and so the average buyer concludes, provided that the supply of such power is reliable. That is a very important factor and one which must enter into the buyer's consideration when he is ready to make his choice.

One factor, of course, always predominates in the matter of selecting a prime mover for an ice-making plant and that is the quality of water available for making fresh-water ice. One does not think any longer in terms of distilled water unless the water supply for the purpose of making ice is strictly unsuitable for the production of a clear, attractive-looking block. In that event a plain distilled-water plant is the only resort. Expensive combinations, such as multiple-effect evaporators, have been tried out, producing distilled water on an economical basis with coal and driving the ammonia compressors by another source of power; but it has almost invariably proved to be a fact that the first cost of this complicated equipment and its high maintenance cost, particularly that of the evaporators, makes it far from a good plan for plain commercial ice manufacture.

This discussion and the comparisons made are concentrated on the fresh-water plant, since that type of plant unquestionably predominates today and should be of greatest interest to the man now in the ice business or the man who contemplates entering it. Not many years ago, even since the development of an efficient fresh-water system, one plant was installed in New York in which the compressors were driven by the uniflow engines and the auxiliary power supplied from a uniflow engine-driven electric unit. That plant made continuously an average of 18 tons of ice per ton of coal, using steam at 165 lb., 150 deg. superheat, and condensing at a 25-in. to 26-in. vacuum. Water supply was from deep wells at about 55 deg. Despite this individual case of economical performance, however, every plant that is started in the city of New York today is a fresh-water motor-driven plant.

The conditions which prevail in the larger cities and centers as to the source of power supply are not always prevalent in newer or less concentrated communities. Therefore there may be reason for the selection of prime movers other than electric motors in many localities until they become modernized as to the source and cost of electric power supply. The time, however, is almost bound to come when virtually every ice plant will be motor-driven.

### RELATIONS OF ELECTRIC AND OTHER FORMS OF POWER

An examination of the relation which electric power and fuel costs bear to the over-all costs of manufacture—namely, operating costs plus fixed charges—is important. Assume, as a practical layout, a 100-ton modern fresh-water ice plant, using cooling-tower water, 1,600 300-lb ice cans in two tanks, about 35,000 ft. of 1¼-in. pipe, with all modern appurtenances for multiple can harvesting and automatic can filling at the dump, operating over a period of eleven months on a 10,000-ton season storage with a year's production of 32,000 tons of ice. The results ascertained by analysis from a plant of this size with various types of prime movers ought to give the answer. The selection of prime movers would involve a consideration of the following:

1. Motor-driven plant, using two ammonia-compressor units, synchronous-motor-driven, direct-connected; all motor-driven auxiliaries.
2. Uniflow engine-driven plant using two compressor units, each direct-connected to uniflow engine, and a uniflow engine-driven generator of sufficient size for driving all auxiliaries by motor; water-tube boilers, 165 lb. steam pressure, 150 deg. superheat, with modern superheaters, economizers, motor-driven boiler-feed pumps, etc., engines operating condensing.
3. Oil-engine-driven plant using two ammonia-compressor units, each belted to full Diesel-type Busch-Sulzer, or equal,

*From a paper presented at the Southwest Geographic Division, N. E. L. A., convention at Oklahoma City, March 14-16, 1923.

oil engine, and one oil-engine-driven generator set of sufficient size for driving all auxiliaries by motors.

4. Oil-engine-driven plant using less expensive oil engines of the semi-Diesel type, Fairbanks-Morse, Worthington, or equal, using two compressor units, each belted to an oil engine, and one oil-engine-driven generator set of sufficient size to drive all auxiliaries by motor.

In each case two ammonia compressor units are considered. That is done, first, to secure a better load factor and, second, to reduce the hazard of interruption. It would hardly be fair to make comparisons based on two units in one case and a larger unit in another case.

There are many other points of advantage to warrant the selection of two compressors, each individually driven, rather than a large single unit. The two compressors need not necessarily be of equal size, but nevertheless there should be two. The power and fuel costs are assumed to be as follows:

Electrical energy at 1.5 cents per kilowatt-hour average for the year, taking into consideration load factors, maximum-demand charge, etc.

Coal at $4.50 per ton, delivered to boiler room in bunkers or otherwise.

Fuel oil at 5 cents per gallon for oil-engine-driven purposes, delivered and placed in tanks at plant.

It is not expected that these three unit costs of power and fuel will simultaneously exist in any one particular point in the country. It is realized that at some points the cost of coal is almost prohibitive while at these same points fuel oil may be very cheap. The same thing might apply to electric power in certain localities where this particular combination exists, and such points represent the average between the oil fields and coal fields. Substitutions can be readily made in the accompanying analysis table for any other fuel or power costs.

### Comparative Manufacturing Costs

The manufacturing cost per ton of ice, which includes operating costs and fixed charges, is as follows:

| | Per Ton |
|---|---|
| Motor-driven plant | $2.17 |
| Uniflow steam-engine-driven plant | 2.34 |
| Full Diesel oil-engine-driven plant | 2.32 |
| Semi-Diesel oil-engine-driven plant | 2.38 |

As between the last two plants an increase of 6 cents per ton will be noted when the cheaper engine is used. That difference is accounted for by higher fuel-oil consumption and particularly by higher lubricating-oil and maintenance cost. The full Diesel-type engine has a much more scientific and efficient lubricating system, everything being force-feed and eliminating splash with consequent evaporization. Moreover, the full Diesel type works under higher pressures and temperatures and is designed and built to operate more economically on fuel oil.

The interesting feature of the accompanying tabulations is the fuel or power cost per year as compared with the total manufacturing cost. As mentioned above fuel costs are often compared without due consideration of much else that enters into the cost of ice. The following will indicate why purchasers are misled in many instances.

### Reasons for Lower Electric Costs

With the motor-driven plant 30 per cent of the total manufacturing cost is for power bills, and yet, according to the tabulation, ice can be made therewith for the least money. First of all, the total investment in the plant is lower, which cuts down the fixed charges. Second, the labor requirements in that plant are less by reason of its simplicity. Third, the upkeep or maintenance cost is bound to be less. Fourth, the type of engineering skill that is, of necessity, needed in a steam or oil-engine-driven plant is not required in a motor-driven plant. Therefore a chief engineer can be engaged at a smaller salary.

The fixed charges, of course, represent the greatest difference and are the charges that are often overlooked or underestimated. In the case of the uniflow-engine-driven plant and oil-engine-driven plants the fuel cost runs from 11.9 per cent to 14.7 per cent of the manufacturing cost, which shows that the power cost in the motor plant is virtually two and one-half times

PERCENTAGE OF POWER OR FUEL TO TOTAL MANUFACTURING COST

| Type of Plant | Total Yearly Manufacturing Cost | Yearly Power and Fuel Cost | Per Cent Ratio of Power or Fuel Cost to Total Manufacturing Cost |
|---|---|---|---|
| Motor-driven | $69,630.00 | $22,100.00 | 32.0 |
| Uniflow steam-engine-driven | 74,932.00 | 9,300.00 | 12.5 |
| Full Diesel oil-engine-driven | 74,362.00 | 8,800.00 | 11.9 |
| Semi-Diesel oil-engine-driven | 76,294.00 | 11,160.00 | 14.7 |

the average cost required with coal or fuel oil; but in the steam plant and oil-engine-driven plants the investment makes the fixed charges soar and the maintenance is bound to be higher. More and better skilled labor is required. Besides, there is more likelihood of service interruption with oil-engine-driven plants than with motors operated from central-station service.

This statement is not intended to be detrimental to the oil-engine builder, but it remains a fact that a high-speed reciprocating unit working under high temperatures and at a continuous full load is much more subject to breakdown than a motor-driven installation. It does not take a very long shutdown in a 100-ton ice plant to curtail the earnings seriously and cause a loss which would probably offset any gain that the owner hoped to reap by the selection of a particular prime mover.

With the steam-engine-driven plant, which makes ice cost $2.32 per ton, 1.86 cents per kilowatt-hour could be spent for power; in the full Diesel oil-engine plant, in which the ice costs $2.32 per ton, 1.83 cents per kilowatt-hour could be spent for power. These figures do not take into account the relative hazard of service interruption, which must necessarily have consideration.

A motor is the only prime mover that really operates at a constant efficiency with a minimum amount of attention. A uniflow-engine-driven or oil-engine-driven plant must be kept in top-notch condition if it is to produce maximum rating at maximum economy under practically full-load conditions throughout a period of eleven months. That requres a top-notch chief engineer who has his heart in the plant—a type of man not always available.

## Bombay Electrification to Proceed

FROM Bombay Assistant United States Commissioner C. B. Spofford reports that announcement has been made by the Great Indian Peninsula Railway of sanctions to proceed with the first 30 miles of the Bombay suburban electrification scheme as far as Thana. Preparations are far advanced and contract will be placed at an early date for the first 20 miles of trackwork and special rolling stock.

# Forcing Most Economical Load Division by Reactors

## Investigation of Values on Boston System Leads to Decision to Install Reactors with Taps Permanently Built Into Reactor Structure — Limits Voltage Drop

By A. H. SWEETNAM

*Assistant Electrical Superintendent*

*Edison Electric Illuminating Company of Boston*

IN RECENT years many of the large central-station companies, owing to their abnormal growth and the resulting large concentration of generating capacity, have found themselves with oil circuit breakers of insufficient interrupting capacity. This condition in many cases has resulted in the application to transmission lines, buses and apparatus of current-limiting reactors. In articles which have appeared from time to time in the technical press, the subject has been treated chiefly from the viewpoint of limiting short-circuit current to a value which can safely be interrupted by the existing breaker installation. In some cases the application of reactors is made for this purpose alone, as experience has shown that in case of fault the bus pressure has been reduced to such a value that synchronous equipment will fall out of step.

TABLE I

External reactance in ohms required in No. 4/0 B. & S. gage cable (operating in parallel with 300,000-circ.-mil cable having 1-ohm external reactor) in order that cables may divide current and kilowatt load in accordance with the respective cross-sections.*

| Length in Miles | Total Reactance (Ohms) Inherent and External | Inherent Reactance (Ohms) | External Reactance (Ohms) |
|---|---|---|---|
| 1 | 1.670 | 0.188 | 1.482 |
| 2 | 1.922 | 0.376 | 1.546 |
| 3 | 2.174 | 0.564 | 1.610 |
| 4 | 2.427 | 0.752 | 1.675 |
| 5 | 2.679 | 0.940 | 1.739 |
| 6 | 2.931 | 1.128 | 1.803 |
| 7 | 3.184 | 1.316 | 1.868 |
| 8 | 3.436 | 1.504 | 1.932 |
| 9 | 3.688 | 1.692 | 1.996 |
| 10 | 3.941 | 1.880 | 2.061 |
| 11 | 4.193 | 2.068 | 2.125 |
| 12 | 4.445 | 2.256 | 2.189 |
| 13 | 4.698 | 2.444 | 2.254 |
| 14 | 4.950 | 2.632 | 2.318 |
| 15 | 5.202 | 2.820 | 2.382 |

*This table is prepared on the assumption of the use of three-conductor. 15,000-volt working-pressure cable (operating at a frequency of 00 cycles per second) having 7/32-in. insulation over each conductor. The formula used in the calculation is: External reactance in ohms for No. 4/0 = 1.4175 $(1+0.178N)-9.188N$, where $N$ = the length of cable in miles.

One application which appears very important has apparently not been treated. This is the use of reactors to apportion load between transmission lines of different cross-sections operated in parallel on the same substation bus. In such a case the current and hence the kilovolt-amperes divide inversely as the respective impedances, while the kilowatts divide inversely as the reactances of the lines.

A concrete case would be a No. 4/0 B. & S. gage and a 300,000-circ.mil three-conductor, 15,000-volt working pressure cable, each having $\frac{7}{32}$-in. paper insulation. The 60-cycle reactance per phase per mile of the No. 4/0 cable is approximately 0.188 ohm, and that of the 300,000-circ.mil cable is 0.178 ohm; hence the kilowatt load will divide approximately 50 per cent to each. The corresponding impedances are 0.334 ohm and 0.264 ohm, and the current will divide approximately 44 per cent and 56 per cent. The copper cross-sections are approximately in the ratio of 41 and 59 per cent. Assuming a load of 10,400 kw. and 80 per cent power factor, the current and kilowatt load would divide as follows:

No. 4/0:

$R = 0.275$ ohm; $X = 0.188$ ohm; $Z = 0.334$ ohm.

5,060 kw., 5,750 kw., 88 per cent power factor, 221 amp.

300,000-circ.mil:

$R = 0.194$ ohm; $X = 0.178$ ohm; $Z = 0.264$ ohm.

5,340 kw., 7,250 kva., 73.7 per cent power factor, 279 amp.

Resultant $X = 0.0914$ ohm. Resultant $Z = 0.147$ ohm.

From these figures it is evident that the smaller line carries more than its proportion of the load, and if the load were to be increased, the smaller line would become appreciably overloaded with full load on the larger line.

In order to utilize the full capacity of copper installed, it would be desirable to install reactors of such rating as would result in the total impedance of the lines being in the same ratio as the resistances. This would result in a division of both current and kilowatt load in accordance with the line cross-sections. However, the problem is complicated by the wide range in reactor sizes which must be installed, as shown in the following:

For the purpose of this study it may be assumed that in order to limit drop in bus voltage (due to line fault) to a value at which synchronous equipment will not fall out of step a minimum reactance of 1 ohm will be required. Such a reactor installed in a 300,000-circ.mil line a mile in length would result in a total impedance of 1.194 ohms. ($R = 0.194$ ohm; $X = 0.178 + 1.000 = 1.178$ ohms).

TABLE II

External reactance in ohms required in 300,000-circ.mil cable (operating in parallel with No. 4/0 B. & S. gage cable having 1-ohm external reactor) in order that cables may divide current and kilowatt load in accordance with the respective cross-sections.

| Length in Miles | Total Reactance (Ohms) Inherent and External | Inherent Reactance (Ohms) | External Reactance (Ohms) |
|---|---|---|---|
| 1 | 0.838 | 0.178 | 0.660 |
| 2 | 0.971 | 0.356 | 0.615 |
| 3 | 1.103 | 0.534 | 0.569 |
| 4 | 1.236 | 0.712 | 0.524 |
| 5 | 1.368 | 0.890 | 0.478 |
| 6 | 1.496 | 1.068 | 0.428 |
| 7 | 1.634 | 1.246 | 0.388 |
| 8 | 1.766 | 1.424 | 0.342 |
| 9 | 1.899 | 1.602 | 0.297 |
| 10 | 2.032 | 1.780 | 0.252 |
| 1 | 2.164 | 1.958 | 0.206 |
| 12 | 2.297 | 2.136 | 0.161 |
| 13 | 2.429 | 2.314 | 0.115 |
| 14 | 2.562 | 2.492 | 0.070 |
| 15 | 2.695 | 2.670 | 0.025 |
| 15.67 | 2.784 | 2.789 | ..... |

In order to have the total impedance in the same ratio to the 300,000-circ.mil line as the resistances the No. 4/0 line ($R = 0.275$ ohm, $X = 0.188$ ohm) would have a total impedance of $(0.275 \div 0.194) \times 1.194 = 1.692$ ohms, and a total reactance of $(0.275 \div 0.194) \times 1.178 = 1.670$ ohms, or an external reactance of $1.670 - 0.188 = 1.482$ ohms. If the length of line were to be 10 miles and the same size of reactor were installed in the 300,000-circ.mil line, the total impedance would become 3.39 ohms. ($R = 1.94$ ohms; $X = 1.78 + 1.00 = 2.78$ ohms.) The total impedance of the No. 4/0 line then must be $(2.75 \div 1.94) \times 3.39 = 4.81$ ohms and the total reactance $(2.75 \div 1.94 \times 2.78 = 3.94$, or an external reactance of $3.94 - 1.88 = 2.06$ ohms.

It becomes evident that with a fixed ohmic (external) reactor in a 300,000-circ.mil line the ohmic reactance required in the No. 4/0 line varies with the length of line. With lines 15 miles in length and with 1 ohm external reactance in the 300,000-circ.mil line the external reactor required in the No. 4/0 line becomes 2.38 ohms, or a 5.5 per cent reactor based on a rating of 200 amp. at 15,000 volts. The 1-ohm reactor assumed for the 300,000-circ.mil line based on 300 amp. at 15,000 volts is equivalent to approximately 3.5 per cent. If reactors as shown in Table I were installed in the No. 4/0 line, the current and kilowatt load would divide in accordance with the cross-sections. The above condition is illustrated graphically in the accompanying illustration (Fig. 1).

In a similar way it can be shown that if the fixed size and rated reactor were to be installed in the No. 4/0 line, the reactor required in the 300,000-circ.mil line (in order to divide current and kilowatts in accordance with line cross-sections) would have a lower ohmic value than that of the fixed reactor and that this ohmic value would vary inversely as the length of the line. Calculations show that for a line 15.67 miles in length no reactor would be required in the 300,000-circ.mil line. Fig. 2 shows the above conditions in graphic form.

Assuming the same load conditions on lines ten miles in length and a 1-ohm reactor in each line, the current and kilowatt load would divide as follows:

No. 4/0:

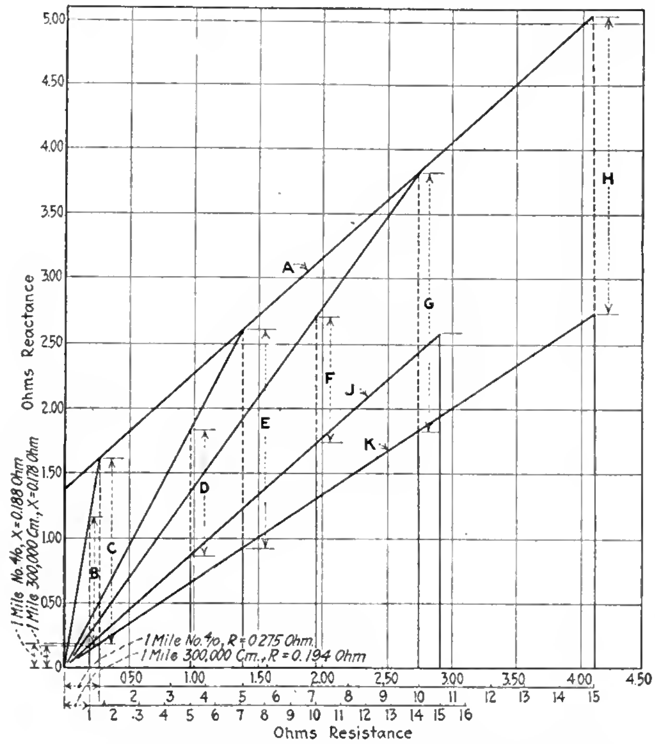
$$R = 2.75 \text{ ohms};\ X = 1.88 + 1 = 2.88 \text{ ohms};$$
$$Z = 3.98 \text{ ohms}.$$

5,106 kw., 5,977 kva., 85.43 per cent power factor, 230 amp.

300,000-circ.mil:

$$R = 1.94 \text{ ohms};\ X = 1.78 + 1 = 2.78 \text{ ohms};$$
$$Z = 3.39 \text{ ohms}.$$

5,294 kw., 7.023 kva., 75.38 per cent power factor, 270 amp. Resultant $X = 1.414$ ohms. Resultant $Z = 1.831$ ohms.



A—Total reactance required in No. 4/0 B. & S. line in order to divide current and kilowatt load with 300,000-circ.mil line (having 1-ohm external reactor) in accordance with respective cross-sections.
B—1-ohm external reactor in 300,000-circ.mil, 1-mile line; 1.482-ohm external reactor required in No. 4/0, 1-mile line in order that lines may divide current and kilowatt load in accordance with cross-sections.

| 6 | 5,127 | 49.30 | 6,092 | 46.86 | 234 | 84.16 | 5,273 | 50.70 | 6,908 | 53.14 | 266 | 76.33 |
| 7 | 5,119 | 49.22 | 6,053 | 46.56 | 233 | 84.57 | 5,281 | 50.78 | 6,947 | 53.44 | 267 | 76.02 |
| 8 | 5,117 | 49.20 | 6,022 | 46.32 | 232 | 84.97 | 5,283 | 50.80 | 6,978 | 53.68 | 268 | 75.71 |
| 9 | 5,111 | 49.15 | 6,001 | 46.16 | 231 | 85.17 | 5,289 | 50.85 | 6,999 | 53.84 | 269 | 75.57 |
| 10 | 5,106 | 49.10 | 5,977 | 45.98 | 230 | 85.43 | 5,294 | 50.90 | 7,023 | 54.02 | 270 | 75.38 |
| 11 | 5,105 | 49.09 | 5,958 | 45.83 | 229 | 85.68 | 5,295 | 50.91 | 7,042 | 54.17 | 271 | 75.19 |
| 12 | 5,101 | 49.05 | 5,945 | 45.73 | 229 | 85.80 | 5,299 | 50.95 | 7,055 | 54.27 | 271 | 75.11 |
| 13 | 5,100 | 49.04 | 5,929 | 45.61 | 228 | 86.02 | 5,300 | 50.96 | 7,071 | 54.39 | 272 | 74.95 |
| 14 | 5,097 | 49.01 | 5,919 | 45.53 | 228 | 86.11 | 5,303 | 50.99 | 7,081 | 54.47 | 272 | 74.89 |
| 15 | 5,097 | 49.01 | 5,910 | 45.46 | 227 | 86.24 | 5,303 | 50.99 | 7,090 | 54.54 | 273 | 74.80 |

After the above study, the Edison Electric Illuminating Company of Boston, which found itself faced with this problem, decided to install reactors having taps permanently built into the reactor structure. The plan is to install these tapped reactors in No. 4/0 B. & S. gage lines which are required to operate in parallel with lines of 300,000-circ.mil cross-section, the purpose being to utilize the full cross-section of copper installed and also minimize copper losses.

Assume that two transmission lines operating in parallel, one of No. 4/0 B. & S. gage and the other of 300,000-circ.mil cross-section, to have been equipped with reactors, as above outlined; assume further that the No. 4/0 B. & S. gage line is to be looped in and out the premises of a new customer having a demand in the neighborhood of 1,000 kva., it becomes evident at once that this No. 4/0 line will reach full load in advance of the 300,000-circ.mil line.

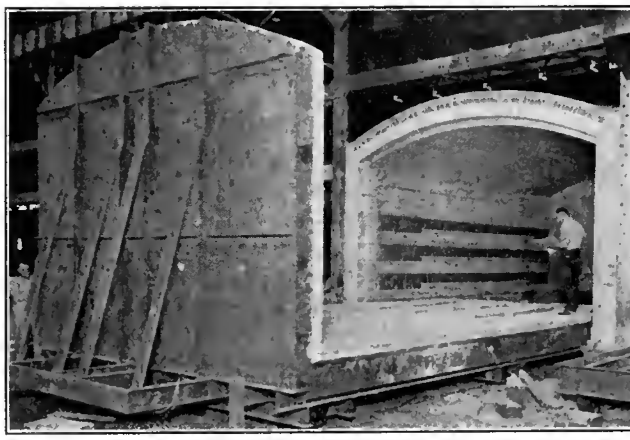
A further advantage of having this smaller line equipped with a reactor having taps is that they limit the current in the smaller line and increase the current in the larger line.

## Electric Furnace for Annealing Turbine Castings

THERE has been installed recently in the Schenectady plant of the General Electric Company an automatically controlled heat-treating furnace which is probably unique both in the matter of size and in the kind of work done. It is used for annealing large turbine castings, some weighing 85,000 lb., to relieve the internal strains left in castings, which would otherwise cause them to break or warp when machined.

The inside dimensions of the furnace are: Width, 15 ft. 10 in.; length, 27 ft. 7 in.; height, 8 ft. 7 in. The total connected load is 700 kw. at 550 volts, three-phase. The temperature maintained is 1,000 deg. F. The load is divided into two sections, 160 kw. being on the car top, which forms the floor of the furnace, and 540 kw. on the two side walls. The furnace is heated with General Electric ribbon resistor units. The door is mounted at one end of the car, the whole being pulled in or out to close or open the furnace.

In order to relieve the strains in a casting properly, it is necessary to have an exact uniformity of temperature in all parts of the furnace. By beginning the car top or floor heaters and the side-wall heaters with independent automatic temperature control a variation which tests have shown to be not greater than plus or minus 10 deg. has been obtained under operating conditions. The furnace has been a complete success, and up to the present there has not been a single case of a casting being rejected because of improper annealing. The great cost of these large castings made it imperative to install a furnace with absolute accurate temperature control.



ANNEALING FURNACE FOR 85,000-LB. CASTINGS

# Quick Calculation of Line Regulation

### Chart Which Permits Determination of the Characteristics that a Line Must Have to Meet Given Performance

BY CARY T. HUTCHINSON
Consulting Engineer, N. Y.

A NUMBER of diagrams for determining the regulation of alternating-current circuits are in use. Several of them, notably that of Baum, involve parts having relative motion; others, as the Mershon diagram, involve either the construction of the impedance triangle on the diagram or the use of a straight edge. as the Dwight. These are all somewhat intricate and do not lend themselves as readily as might be to the quick determination of regulation under different conditions.

The diagram on page 1466 gives the regulation for any circuit at any power factor, either lagging or leading, when the ratio of reactance to resistance, $x/r$, and the impedance pressure drop are known for any given circuit conditions. For explanation of chart see page 1467.

## Directions for Use of Chart Enabling Calculation of Line Regulation

Knowing the ratio of reactance to resistance and the impedance pressure drop, proceed as follows: Enter the diagram on the axis of $x/r = \tan \epsilon$ at the lower left edge of the diagram, at the given value of $x/r$, for instance, 3. Follow this ordinate to the right to the curve marked with the power factor of the circuit, e.g., 0.95; follow vertically upward to the diagonal line marked with the value of the impedance pressure drop, e.g., 20 per cent; follow horizontally to the intersection with the "regulation" curve. The regulation is the value of the abscissa of this curve given at the top of this sheet; in this case, 13.2 per cent.

**To determine the power factor required to give any particular regulation, proceed as follows:** Follow horizontally from the value of the regulation—e.g., 15 per cent—to the intersection with the locus of the impedance pressure drop, e.g., 25 per cent; follow vertically down to the intersection of that line with the value of $x/r$, e.g., 3. The point of intersection then lies on the power-factor curve, approximately 0.965.

**For zero regulation** the intersection of the axis of abscissas with the line for the value of impedance drop—e.g., 25—determines the point at which the vertical line to the value of $x/r$ shall be run. If $x/r = 3$, the intersection of this line with the vertical gives a leading power factor of 0.9; i.e., a circuit having a reactance ratio of 3 operated at leading power factor of 0.9 will be self-regulating if $\mu = 25$ per cent.

### BASED ON VECTOR-TRIANGLE SOLUTION

The diagram is based upon the solution of the ordinary vector triangle, as shown. It is accurate to the degree that the scale can be read. The value of $(1 + \Delta)^2$ is plotted in terms of cos $(\epsilon - \phi)$ for constant values of $\mu$, the impedance pressure drop. The equation giving the generator pressure is

$$(1 + \Delta)^2 = 1 + \mu^2 + 2\,\mu \cos (\epsilon - \phi).$$

This gives a family of straight lines for the series of values of $\mu$. The square root of the value of the ordinate, $(1 + \Delta)^2$, is given by the curve marked "regulation." Dropping unity, the value of $\Delta$, the "regulation," is read on the horizontal scale at the top of the diagram.

The first step in the use of the diagram is to find $r$, the resistance per mile, and $x$, the reactance per mile, from tables, or from the following formulas:

$r = 10^{-2} \times 5.6/N$, ohms per mile,

(at 60 cycle) $x = 0.11 + 0.28 \log D/d$, ohms per mile,

where $N$ = area of wire, circular-inches,

$D$ = distance apart of wires in inches,

$d$ = diameter of wire in inches.

The value of $x$ can readily be found by the slide rule.

The following approximation, not a very close one,

$$x/r = 12.5N,$$

will serve for transmission lines with spacing about 8 ft. to 10 ft. and conductors from No. 0 to 0.7 circ.-in.; this assumes $x$ to be constant over the range of sizes included.

For values of $x/r$ greater than 10, the limit of the diagram, 10 may be used with small error, inasmuch as the angle for $\tan \epsilon = 10$ is nearly 90 deg., and considerable differences in the value of $x/r$, when greater than 10, give small differences in cos $(\epsilon - \phi)$ and negligible differences in the regulation, as may readily be proved by trial.

The resistance pressure drop, $\rho$, is related to the power loss, $\lambda$, by the equation

$$\lambda \cos \phi = \rho$$

$\lambda$ may be one of the assumed data.

If the size of conductor is assumed, instead of the power loss, then $\rho$ may be found from the basic data of the problem.

Let $Q$ = apparent power delivered, in kva.,

$P$ = power delivered, in kw.,

$V$ = pressure delivered, in kv.,

$\cos \phi$ = power factor,

$L$ = distance, in miles,

$N$ = area of conductor, in circular inches,

$\lambda$ = power loss, in per cent/100,

$\rho$ = resistance pressure drop, in per cent/100.

Then,

$$Q \cos \phi = P$$

$$\lambda \cos \phi = \rho$$

and $$\rho N = 10^{-5} \times 5.6 \left(\frac{Q}{V}\right)\left(\frac{L}{V}\right).$$

This equation gives either $\rho$ or $N$, when the other is known.

Next, $\mu$, the impedance pressure drop, is determined from $\rho$, the resistance pressure drop, by the equation

$$\mu^2 = (1 + \overline{x/r^2})^2.$$

This value is readily found by slide rule. It is usually sufficient to take

$$\mu = \rho x/r;$$

that is, to take reactance equal to impedance, inasmuch as $x/r$ is usually greater than 3, for 60 cycles.

Having thus found $x/r$ and $\mu$, and cos $\phi$ being given, the regulation is taken directly from the diagram.

The foregoing discussion ignores line capacity. For pressures up to 66 kv. and distances up to 100 miles, the effect of charging current is practically negligible. For example, in that case the charging current would be about 20 amp. and 760 kva. per conductor. If the total apparent power transmitted is 22,800 kva., the charging current is equivalent to about 10 per cent of the line current. The effect of this on regulation can be found by first calculating the equivalent power factor, as follows:

Assume, $\cos \phi = 0.85$, $\sin \phi = 0.53$; the correction to $\sin \phi$ on account of capacity is, $0.10/2 = 0.05$; hence

$\sin \phi' = (0.53 - 0.05) = 0.48$, and

$\cos \phi' = 0.88$.

If $x/r = 5.0$, and

$\mu = 30$, the diagram gives for

$\cos \phi = 0.85$, $\Delta = 22.0$ per cent;

$\cos \phi' = 0.88$, $\Delta' = 20.7$ per cent.

If the pressure is 132 kv., the charging current is doubled and

$\sin \phi' = (0.53 - 0.10) = 0.43$ per cent,

$\cos \phi'' = 0.90$ per cent

$\Delta' = 20.0$ per cent.

Even in this case—i.e., 45,600 kva., 100 miles at 132 kv.—the correction to the regulation is only 10 per cent.

### REFERS TO LINE REGULATION ONLY

The examples given here refer to the line only. The regulation should include the transformer drop as well; therefore, the ratio $x/r$ is not dependent upon the line alone; it is found by summing up the resistance drops and the reactance drops of transformers and line. As an example: Resistance pressure drop in each transformer, 0.75 per cent; reactance, 10 per cent; resistance pressure drop in line, 6.0 per cent; $x/r$ of line = 3. Then total resistance pressure drop = 7.5 per cent, total reactance pressure drop = 10 + 10 + (3 × 6) = 38, and $x/r$ for the circuit = 38/7.5 = 5.06. Regulation is then fixed by $x/r = 5.06$, $\mu = 38$; for $\cos \phi = 0.9$, $\Delta = 26.5$ per cent.

### EXAMPLES THAT ILLUSTRATE THE USE OF THE DIAGRAM

| Data: | Results: |
|---|---|
| 1. $\cos \phi = 0.9$, $x/r = 5$, $\mu = 20$. | 1. $\Delta = 13$, $\rho = 4$, $\lambda = 4.4$, $N = 0.4$. |
| 2. $\cos \phi = 1.0$, $x/r = 5$, $\mu = 20$. | 2. $\Delta = 5.5$, $\rho = 4$, $\lambda = 4$, $N = 0.4$. |
| 3. $\cos (-\phi) = 0.85$, $x/r = 5$, $\mu = 20$. | 3. $\Delta = -5.5$, $\rho = 4$, $\lambda = 4.7$, $N = 0.4$. |
| 4. $x/r = 4$, $\mu = 20$, $\Delta = 10$. | 4. $\cos \phi = 0.98$, $\rho = 5$, $\lambda = 5.1$, $N = 0.32$. |
| 5. $x/r = 4$, $\mu = 20$, $\Delta = 0$. | 5. $\cos (-\phi) = 0.95$, $\rho = 5$, $\lambda = 5.3$, $N = 0.32$. |
| 6. $x/r = 3$, $\rho = 5$, $\Delta = 0$. | 6. $\cos (-\phi) = 0.92$, $\mu = 15$, $\lambda = 5.4$, $N = 0.24$. |
| 7. $P = 28{,}000$ kw. $\cos \phi = 0.85$, $L = 6.6$, $V = 66$, $N = 0.28$. | 7. $Q = 33{,}000$ kva., $\rho N = 10^{-2} \times 2.8$, $\rho = 10$, $x/r = 3.5$, $\mu = 35$, $\Delta = 28.3$, $\lambda = 11.8$. |
| 8. Same as (7) except $\cos \phi = 1.0$. | 8. $\rho = 8.5$, $\mu = 29.8$, $\Delta = 11.7$, $\lambda = 8.5$. |

In the above examples $N$ has been found by the approximate formula above; hence these results are applicable to transmission lines of approximately 8 ft. to 10 ft. spacing, as already stated.

# The Management of Suburban Districts

## An Outline of the Methods that Are Followed in the District Offices of the Detroit Edison Company—Line and Staff Organization—Billing, Collecting and Contact with Customers

By HERBERT SILVESTER
*District Agent the Detroit Edison Company, Ann Arbor, Mich.*

SALESROOM OF THE ANN ARBOR DISTRICT OFFICE, DETROIT EDISON COMPANY, WHICH FUNCTIONS FOR ALL DEPARTMENTS IN THE COMPANY'S RELATIONS WITH THE CUSTOMER AND THE PUBLIC

THE Detroit Edison Company furnishes electric light and power to an area with a radius of approximately 50 miles, surrounding Detroit on the north, west and south. In this area are thirteen incorporated cities and fifty villages. With the exception of five small hydro-electric plants along the Huron River and a steam turbo-generator plant at Marysville, the current is generated in Detroit and transmitted to the outlying districts.

Where possible the departments which function in the metropolis also operate in the suburban districts. That is, the operation of generating plants, substations and transmission lines, the maintenance and construction of overhead lines, general engineering and other work of like nature are directed and supervised by the appropriate Detroit departments, the entire area forming one operating district.

However, because of the necessity of maintaining an intimate contact with the customer, local organizations have been established for the purpose of handling all the relations between customers and the company. To this end nine commercial districts were formed, each in charge of a district agent who reports directly to the vice-president and sales manager. Each district has a complete staff, adequate for taking care of its own business activities, which include, in part, billing customers' accounts, reading meters, collections, applications for new service, connecting and disconnecting meters, selling electrical appliances, soliciting new business, complaints and adjustments and all other work of a commercial nature.

### "LINE AND STAFF" ORGANIZATION

It will be readily seen that the various departments which center at Detroit and reach out into the districts partake of a functional character, while the district organization is of the line or military type. The efficient features of a functional organization have been retained by allocating work of a technical or semi-technical nature to departments best organized to handle it. With one central control all construction and operating is done uniformly and standards are adhered to more rigidly than under nine separate operating units. It is also possible to have a staff of employees whose training is highly specialized in their particular work. But where directness of action is necessary, as in service to customers, the line type of organization in the commercial department is most effective.

The co-ordination of all departments must be smooth indeed to prevent any whipping at the loose ends. It

has been found feasible therefore to place in the field representatives of the Detroit operating departments who work closely with the district agents. The overhead-lines department is represented by a district foreman, who, through his inspectors and gang foreman, keeps closely in touch with the district agent. Orders for extensions and service drops are sent directly to this district foreman. In addition, all estimates for new business extensions are made at the district offices, thereby keeping in local control all matters which are of a local nature. It is essential also that each local office shall have complete and up-to-date reports of proposed line extensions and service drops. Jobs of this kind must, of course, be scheduled and the customers notified regarding the expected date of completion.

The department operating substations and transmission lines must at times interrupt service to customers. When these interruptions can be foreseen, the commercial department greatly assists both company and customer by conferring with the customers affected and then designating the time and period of interruption. In the matter of voltage regulation, the commercial department maintains recording voltmeters on every feeder for the purpose of recording voltage conditions on customers' premises.

As a number of separate municipalities, each with its own political organization and economic problems, are included in each district, it is essential that the company be directly represented by agents who have the support of the general management. Men trained in the company's policies and practices are assigned to this work. Complaints and adjustments are handled direct so as to afford the customer quick and efficient service.

Uniformity of policy is also essential as the geographic boundaries are not always clearly marked and customers in one district must not be dealt with differently from those in other districts. To this end district agents' meetings are held bi-weekly in Detroit with the vice-president and sales manager presiding, at which time questions of policy and practice that may arise are thoroughly discussed.

The billing of customers is generally done at the local offices and on machines if the number of bills rendered from any one office justifies the overhead expense of this equipment. Where machines are used extra copies of the proof or trial-balance manifold sheets are made. The customers' ledgers are kept in a central office, and every local office is furnished with a sheet showing the details of accounts, thereby permitting quick reference in cases of inquiries regarding bills.

Generally, residence bills are rendered for two months' periods. Each district is divided into two areas and each area is billed on alternate months. By this means it is possible to read meters and render bills with a minimum of expense. Monthly reports showing total kilowatt-hours sold and total of the net bills rendered are sent to the general accountant at Detroit for posting to the general ledger. An analysis of earnings showing kilowatt-hours and net bills sold in each class of service is sent monthly to the statistician at Detroit.

### HANDLING COLLECTIONS

Every village and city has a local office where bills are payable, except in cases where the community is too small to justify the maintaining of an office. In this case an agency is established, generally at a local bank. Bills are delivered by hand in cities and villages and are mailed in rural areas. Customers receive the bills before the first of the month and are allowed ten days for payment with discount.

Soon after the discount day overdue statements are mailed. If no attention is paid to the mailed statement, a series of three follow-up letters is started, the last giving notice that the service must be disconnected for non-payment. The obvious follows. If no response is made to the last or "cut-off" letter, some one is sent to discontinue service, without further notice, unless payment is made when he calls. This collection routine is followed in all cases where customers have good records for payment, but if a customer is so negligent as to become a habitual delinquent only the overdue statement and "cut-off" letter are sent out.

Collection of bad debts is taken care of by the local organization, as its members are more intimately informed regarding conditions affecting the account. Sometimes extra pressure is advisable and a collector from Detroit is called in to make an effort to secure a settlement from a different angle. After all ordinary means of collection are exhausted, the unpaid bills are charged to "uncollectible" and the collection bureau in Detroit starts collecting through legal procedure.

All cash collected is deposited daily in a district depository bank. A duplicate deposit receipt is for-

TWO OF THE DETROIT EDISON COMPANY'S DISTRICT OFFICES, LOCATED IN ROCHESTER (LEFT) AND MONROE, MICH. (RIGHT). BUILDINGS ARE DESIGNED OR SELECTED THAT ARE IN HARMONY WITH THE COMMUNITY AND THE LOCATION

warded to the auditor, who keeps a duplicate cash record. Withdrawals can be made only from the district depository banks by the company's treasurer or auditor.

Fuse calls are made during reasonable hours in villages and rural districts—that is, between 7 a.m. and 10 p.m. In cities of more than 25,000 population fifteen-hour trouble service is given. This work is done without charge to the customers. The repairmen locate the source of trouble, if possible remove it, and fuse the circuit. Where it is necessary to do more than make simple repairs the customer is requested to hire a wiring contractor. Repairs are made to domestic appliances and electric ranges. A complete line of washing-machine and vacuum-cleaner repair parts and replacement heating elements is carried.

Special attention is paid to quick servicing, as dead appliances earn no money for the company. If a customer is in the midst of her ironing and her electric flatiron burns out a "loan" iron is immediately sent her for use until her own iron can be repaired and returned. Service motors are also carried for washing machines and vacuum cleaners. These service motors are painted red, numbered and lettered with the company's name. If the motor on a customer's washing machine breaks down in the midst of a washing, the delay is not long as a service motor is installed and remains in use until the regular motor comes back from the factory, where it is sent for replacement or repairs.

This repair service is limited to domestic appliances of the lamp-socket class. Customers are charged for material required at cost plus 10 per cent. No charge is made for the labor, however, as this is compensated for by the energy used during the period in which the appliance would otherwise be laid up and by the good will thus created.

### Contact with Customers

The actual sales work in smaller communities must be a matter of personal contact between the company and its customers. Soliciting new business is done informally through intimate service. Power installations are closely followed up to see that the customers are apprised of the most efficient methods of electric power applications, and should there be a need of expert engineering advice, this is obtained from the Detroit sales department. The same practice applies to large or unusual lighting installations. All new buildings are closely watched to see that the electric wiring is installed so as to be convenient and efficient.

The application of the company's practice and policy is direct and involves a close personal relationship between the customers and the utility. The district agent or his assistants are acquainted with all the merchants and manufacturers. Contacts are made at various social functions and over the tables of luncheon clubs. Complaints are not accompanied by the acrimony that is sometimes present when the large city customers complain. A series of formal letters gives way to informal conversation, and settlements are made by a satisfactory personal handling of the customer's difficulty. While the remedy is being applied the customer has an opportunity to learn in detail of the company's policies.

It will be readily seen that co-ordination of departments must be as real as it is possible to accomplish with human beings if the best results are to be obtained. This company has enjoyed unusual success in the working arrangements between departments, and credit must be given to the fine co-operative spirit which has been shown by the individual employees.

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

## Kilowatt-Hour Rate of Two Mills Necessary to Make Electro-Steam Generation Profitable

*To the Editors of the* ELECTRICAL WORLD:

In the issue of the ELECTRICAL WORLD for June 9, 1923, on page 1374, in the article headed "A. S. M. E. Hears of Canada's Water Power," it is stated that "surplus water power was used for electric boilers in several plants, but that energy would have to sell at about two cents a kilowatt-hour before it could compete with ten-dollar coal for such purposes."

In reply to a question by John R. Freeman as to the value of electric power when utilized to produce steam, I stated that "one kilowatt-hour produces very approximately 3 lb. of steam in an electric boiler under normal operating conditions. If we assume an average evaporation of 7½ lb. of steam per pound of coal, then one ton of coal produces 15,000 lb. of steam, and therefore 5,000 kw.-hr. is equivalent to one ton of coal. If the cost of coal is $10 per ton, the equivalent value of 5,000 kw.-hr. is $10, so that one kilowatt-hour is worth two mills."

Your reporter evidently put his decimal point in the wrong place and wrote two cents instead of two mills. Will you be good enough to correct this error in your next issue as the subject of the use of electric power for the generation of steam is attracting so much attention that we do not want an erroneous impression to get abroad regarding the value of power for this purpose.

P. S. GREGORY,
Assistant to the Vice-President.
Shawinigan Water & Power Company,
Montreal, Canada.

## A Tribute to Louis Bell

*To the Editors of the* ELECTRICAL WORLD:

The passing of Dr. Louis Bell removes an engineer of surpassing abilities from the profession which he so greatly adorned, but more than this, it deprives a widening circle of friends of a man whose personal charm was very unusual. Few engineers were so gifted in the use of the mother tongue or so competent to make clear the complexities of physical science to readers of the technical press. Mingled with Dr. Bell's profound knowledge of electrical engineering and his specialized comprehension of the laws and methods of illumination and optics were a humorous understanding of men and an enthusiasm for social intercourse with his intellectual kindred that made him a delightful companion to those fortunate enough to know him. His writings for many years have enriched the literature of applied science. He combined great scientific ability with practical engineering judgment and was equally at home whether addressing the American Academy or a municipal street-lighting committee.

He gave his best to the work before him and inspired others to do likewise. He was always looking forward, and the passing years were but stepping stones to new achievement. Research and practice both called him to distinguished service, and his memory will long remain among those who had the privilege of his acquaintance.

HOWARD S. KNOWLTON.
Cambridge, Mass.

# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Stripper Ram Repaired by Arc Welding

THE application of electric welding for repairing stripper rams should be of interest to steel-mill maintenance engineers. In the repair work considered below the ram was 10 in. in diameter and was broken off about 3 ft. from the lower end. With the ram lowered to the extreme limit the broken end was still between the tongs and only 20 in. below the housing of the ram. At the upper limit of travel the broken end would be well up in the housing.

COST OF WELDING STRIPPER RAM

| | | |
|---|---|---|
| New ram, 30 ft. long, 10 in. diameter | $200.00 | |
| Removing old ram and installing new ram | 100.00 | |
| | | $300.00 |
| Old method of welding | $500.00 | |
| Cost of preparation | 48.50 | |
| Cost of finishing | 5.00 | |
| | | $553.50 |
| Arc welding: | | |
| Welding labor and material | $200.00 | |
| Cost of preparation | 33.50 | |
| Cost of electric power | 6.00 | |
| Cost of finishing | 2.00 | |
| Total | | $241.50 |

Consequently this eliminated the possibility of leaving any reinforcement at the point of the break.

After analyzing the problem, a new tip for the ram was prepared from new steel stock, leaving the upper end of the piece cut off flat on the end at right angles with the axis of the piece. The stub end of the ram was then beveled off from two sides to form a blunt chisel end, the point for starting the cut for each face located above the end of the ram, a distance equal to the radius of the ram, in this instance 5 in. Each face was cut parallel with a plane through both of the tongs, so as to be easily available to the welder.

The new tip was then secured in place and proper alignment with the ram obtained by means of two bolts on opposite sides of the pieces, these bolts passing through two clamps, one secured near the upper end of the tip and the other secured to the ram just above the beveled faces. These bolts were inserted adjacent to the tongs, so as not to interfere with the welders.

The work was done during cold weather, and to make it possible for the welders to work continuously a platform about 8 ft. square was constructed at the correct height under the ram so that the welders could easily reach the surfaces to be welded. A housing and roof was constructed around this to protect the work and welders.

The total welding time was about eighteen man-hours, during which approximately 100 lb. of $\frac{3}{16}$-in. welding wire was used.

The alignment of the new tip with the main portion of the ram was almost perfect, and after grinding off the excess weld metal the ram could be drawn up into the stripper boom without any binding. This alignment was made possible by maintaining two welders at work at opposite sides, depositing an equal amount of metal on each side.

The cost of carrying out this work was much less than by the former methods, and the stripper was ready for service about twelve hours sooner. By examining the table of costs it appears that the cost of repairing a ram by the arc process shows only a slight saving over the cost of a new ram. However, the delay in obtaining a new ram would amount to several times this value, owing to the operators of the stripper being kept out of work.

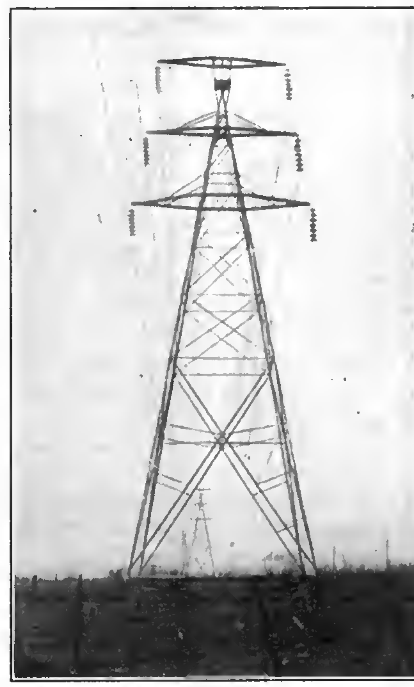
General Engineering Department,
Westinghouse Electric & Manufacturing Company,
East Pittsburgh, Pa.

## Transmission Power Line Reconstructed

DURING the past year the Niagara, Lockport & Ontario Power Company of Buffalo, N. Y., completed the reconstruction of a 60,000-volt, single-circuit, pin-type insulator steel-tower line to a double-circuit, 110,000-volt line. The reconstructed suspension tower is shown in the accompanying illustration. The original line was built in 1906 with 550-ft. spacing and 214,000-circ.mil full aluminum cable with 19-ft. sag and 30-ft. ground clearance. Through the use of aluminum cable, steel-reinforced, and pulling this cable to a sag of 10½ ft., it was possible to install two circuits and maintain a ground clearance of not less than 25 ft. The decreased sag, of course, required much stronger structures at dead-end and deflection points, which were taken care of by new towers. Moreover, in some instances the intermediate suspension towers had to be raised by 5 ft. or 10 ft. More than 80 per cent of the old towers and 90 per cent of the old foundations could be utilized for this new construction.



RECONSTRUCTION OF 60,000-VOLT LINE FOR 110,000 VOLTS SAVED $2,000 A MILE IN TOWER COST

An analysis of the cost of the completed construction showed that the company saved at least $2,000 a mile in tower construction by utilizing the old towers and old foundations wherever possible.

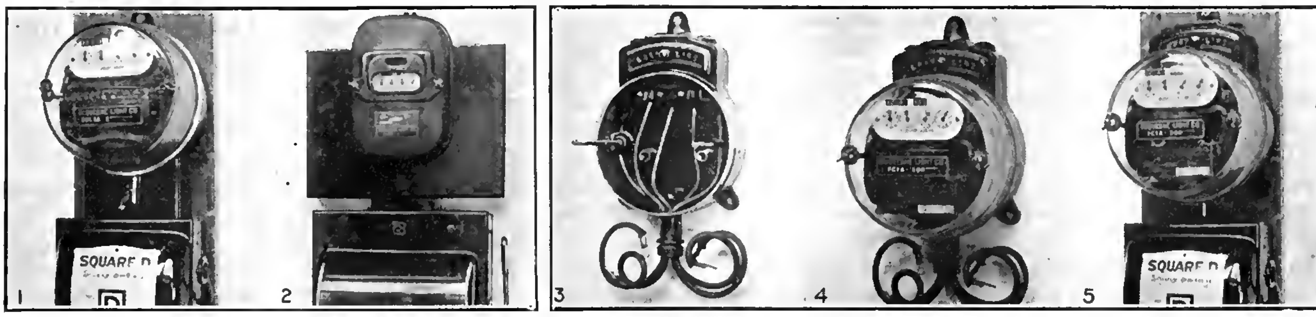

FIGS. 1, 2, 3, 4 AND 5—ADAPTING TOP-CONNECTED METERS TO STANDARD SAFETY CABINETS COST $1.25 PER METER

# Duquesne Company Modifies Meters

### Reconstructs Top-Connected Instruments to Meet Demands of Safety Cabinets and Plans Meters to Dispense with Terminal Lugs by Using Pipe Connection

BY SEALING up the terminals on old types of top-connected meters and bringing the four leads from the terminal block down in back of the meter elements and out through a ¾-in. nipple the Duquesne Light Company plans to utilize 14,000 of these meters in regulation safety cabinets. Up to date several hundred of them have been reconnected and installed on the system and the results obtained have been very satisfactory. Experiments to dispense entirely with the terminals of modern meters, using instead a nipple construction, as shown herewith, have also been made.

The present requirements of this company in regard to self-contained single-phase and polyphase watt-hour meter installations using standard meters are shown in Figs. 1 and 2. In order to make these requirements effective it became necessary to withdraw certain types of watt-hour meters from service. The disposal of the types withdrawn from service and the subsequent reconnection of a large portion of them may present some ideas to other utilities as well as to manufacturers of watt-hour meters.

On June 30, 1922, approximately 50,000 of the 170,000 watt-hour meters owned by the Duquesne Light Company were composed of Westinghouse type C polyphase and Westinghouse types standard, A, B, C, CB, CD, CE and CF single-phase meters. All of these meters were of the self-contained type with current ratings ranging from 5 amp. to 75 amp. Obviously, top-connected meters do not lend themselves to the idea of standardization, nor is it possible to effect an ironclad installation with this type. These considerations, together with the fact that some of the types were obsolete and that it was impossible to secure repair parts for others, were responsible for the order withdrawing all top-connected meters from service.

Standards and type A single-phase meters are now obsolete. Types B and C single-phase and type C polyphase meters are of little use because repair parts cannot be obtained from the manufacturer. It was decided to scrap these types as fast as they were withdrawn from service. Types CB, CD, CE and CF, with the exception of the 5-amp. and 10-amp. meter, were to be disposed of in a similar manner. This left approximately 14,000 5-amp. and 10-amp., top-connected, single-phase meters which could be used providing the method of connection could be changed. Orville Buys, superintendent of the equipment and tests department, developed an ingenious method for making the meters available for future use.

The scheme consists of sealing the entrances in the terminal chamber with high-tension cement and spot-welding the wing nut and bolt so that the plate over the terminal chamber cannot be removed. The bottom of the case is drilled and tapped for a ¾-in. nipple about 2 in. in length. Four marked leads of No. 10 B. & S. gage Clark's cable are attached to the terminal posts and are brought out of the case through the nipple, the space between the leads and the nipple being filled with high-tension cement so as to make a dustproof case. The case and leads of a reconnected type CD watt-hour meter are shown in Fig. 3.

A complete meter ready for installing is shown in Fig. 4. The nipples are supplied with a ¾-in. lock nut and bushing and an end wall containing a 1-in. hole with a center 1 in. from the face of the meter board. These end walls were procured from manufacturers on a special order. They can be made to fit any standard safety switch box. One of the meters and a safety switch box are illustrated in Fig. 5.

Very little trouble has been experienced in effecting the reconnection. As fast as the meters are withdrawn from service those types which are to be reconnected are packed in lots of one hundred meters and are turned over to a local machinist, who is under contract to complete the reconnection and return the meters to the meter department. The contract price is $1.25 per meter. The scrap value per meter is in the neighborhood of $1. Combining the scrap value and the cost of reconnecting the meters represents an investment of $2.25, and for this value the Duquesne Light Company is receiving a first-class watt-hour meter

FIGS. 6, 7 AND 8—SUGGESTED ARRANGEMENT FOR NEW METERS

which is good for a period of service equal to the ordinary life of a meter and one which is even more foolproof than the regular bottom-connected meter. When it is realized that 14,000 meters will be made available for service, and that an equivalent number of new meters would average \$8 per meter, then the benefit of the method adopted will be apparent. The difference between the cost of the reconnection and the average cost of new meters—\$5.75—represents a saving of approximately \$80,000.

The reconnected meters are tested on the regular meter-testing benches in the meter department. After the final test and calibration is completed each meter is packed in a container and placed in the stockroom. A special end wall is placed in the container by the meter packer. Reports that have been received from the meter foremen of the various districts state that these meters are easy to install on customers' premises and that field testing is simplified because of the flexible leads.

The results obtained from the use of these meters were so satisfactory that Mr. Buys decided to carry on further experiments on methods for connecting watt-hour meters. Fig. 6 shows a Westinghouse type OA single-phase case which was rebuilt in the meter department. The usual terminal chamber was replaced by a fiber terminal block to which four flexible leads were connected. The leads are brought out of the case through a ¾-in. nipple. Fig. 7 shows a complete meter, and Fig 8 shows the meter together with a standard safety switch box. Single-phase meters with this type of case and a similar method of connection are practically proof against tampering. In addition, several other factors, such as lower manufacturing cost, smaller space and more rapid field testing, recommend the adoption of the scheme. This method of connection would not be applicable for use with single-phase high-capacity meters on account of the size of the leads. However, self-contained, single-phase, two-wire meters above a 25 amp. rating are not used on the Duquesne Light Company's system, and leads for current ratings up to and including this value can be successfully handled.

Experimental work with Westinghouse self-contained type OA polyphase meters has brought out the construction shown in Fig. 9. The terminal chambers have been replaced by a nipple and the terminal blocks by two rectangular fiber blocks. Flexible cables are used for the connections to the elements. A complete meter and the same meter with a standard 60-amp. switch box are shown in Figs. 10 and 11. Complete data are not yet available as to the performance of this reconstructed meter.

The only questionable feature concerns the effect of the current in the leads for the upper element upon the lower element. However, up to 50 amp., there is no indication of interference. The highest permissible rating for self-contained polyphase meters is 75 amp., and further tests will be made to determine whether there is material interference with this value of current. Polyphase meters of this type of construction will possess the same advantages as the single-phase meters that were previously described.

## Economic Loading of Line Transformers

Five methods of determining the loading of transformers were discussed by H. W. Watt, electrical engineer of the Westchester Lighting Company, in a paper presented at the recent convention of the Empire State Gas and Electric Association at Utica, N. Y. The five methods are: Record of meter load, voltage tests during peak load, indicating ammeter and wattmeter readings, recording ammeter and wattmeter, and the use of a thermal indicator. The combination of a thermal indicator with recording ammeter and recording wattmeter was recommended. Operating a transformer underloaded is an inefficient utilization of the investment represented and is, furthermore, productive of low power factor and excessive core loss. Hence it should be avoided as much as exceeding the upper temperature limitation.

A properly loaded transformer may be defined as one in which the maximum load will heat the transformer coils to a temperature not more than 105 deg. or less than 90 deg. C. The upper limit should never be exceeded, the variation in the lower limit depending upon local conditions, such as expectancy of additional load and permanence of installation. Exceeding the upper temperature limitation is liable to burn out the transformer and interrupt the service. Often the latter is more serious than the former. Operating an underloaded transformer results in unnecessary investment, lower power factor and excessive core loss.

The question is what means should be employed to determine the transformer load so that the evils of overloading and underloading can be avoided. Those methods which have been in use for some time and those which have only recently come into use are given below, followed by a brief outline of the relative merits of each method:

1. *Survey of Secondary System and a Record of the Metered Load.*—This method was originally used at a time when the 16-cp. lamp was standard and constituted about 90 per cent of the total load. Domestic appliances were rare. Transformers were rugged and would stand an exceptional overload. Now new lamps are rated from 10 watts to 250 watts and domestic appliances and small motors are found in almost every house. It is not unusual for an incoming tenant to change all small lamps for large ones. The old-style, more rugged type of transformer might have stood this, but the more delicately designed ones now in use certainly can-

not. This method has therefore become obsolete.

2. *Voltage Test During Peak Load.*—This method is fundamentally faulty as it depends upon an overload causing sufficient excessive drop in a transformer. A voltage test taken only on the secondary side of a transformer shows nothing as the primary voltage may be low at the transformer location. The method also necessitates a more or less exact knowledge of the time at which the peak will occur. This is often difficult to predetermine.

3. *Indicating Ammeter or Wattmeter Readings on Secondary or Primary Side with Current Transformer or Split-Core Current Transformer.*—The use of indicating ammeters or wattmeters determines the load on the transformers at the time the reading is taken. This method is open to the objection that there is no record of the load at any other time than that at which the reading is taken.

4. *Recording Ammeter or Wattmeter.*—The use of recording instruments or maximum-demand instruments in place of the indicating instruments used in method No. 3 makes it possible to determine the entire load characteristics and is much superior to any of the above methods.

5. *Thermal Indicators.* — Recently thermal indicators have been used to indicate the load on a transformer by means of its temperature rise. Some of these devices show the actual temperature, while others indicate only when a dangerous temperature has been reached.

On modern secondary systems it is believed that the first three methods have become obsolete and that standard practice should be a combination of the use of thermal indicators with recording ammeters or recording wattmeters. Mr. Watt recommended that companies adopt these two methods with the assurance that by this means they can operate their systems to the best possible advantage, all factors considered.

## Inspection and Care of Ring-Oiled Bearings

THE oil supply must be kept up to the proper level in ring bearings, but not too high, as oil might travel out along the rotating shaft, get into the windings of the machines and attack the insulation. The following rules are prescribed in the operating code of the Philadelphia Electric Company to insure the proper maintenance of ring-oiled bearings.

1. At least every hour, and oftener when necessary, examine bearings, noting: (a) That the oil rings are turning over and carrying oil; (b) that the bearing is not overheating; (c) that there is no chattering or vibration.

2. If the temperature rises to 160 deg. F. (70 deg. C.), steps must be taken to reduce it. In no case may the temperature of the oil be allowed to rise beyond 180 deg. F. (80 deg. C.).

3. When bearings are equipped with water-cooling jackets or coils, make sure that the water supply is not interrupted.

4. To reduce the temperature of a heated bearing, draw off the hot oil and at the same time put in a fresh supply, taking care not to allow the oil level to get below the usual point. Another treatment is to place ice on the oil reservoir on the outboard side of the bearing. Provision must be made to drain the water away from the machine to prevent it from running into the bearings or on the commutator or windings. In conjunction with either of the above methods, slightly loosen the bearing caps.

5. If either or both of these methods of treatment fail to cool off the bearings, the machine must be shut down when the oil temperature reaches the maximum as specified above.

6. If a bearing has been allowed to overheat to the point of melting the bearing metal, the load should be taken off and the speed reduced, if possible. Otherwise, it should be shut down at once.

## Cleaning Boilers for Inspection

BEFORE starting to clean a boiler for inspection it should be taken off the line, complying with the rules given on page 811 of the April 7 issue of the ELECTRICAL WORLD. The rules given below, which have been abstracted from the operating code of the Philadelphia Electric Company, should then be followed. The same rules apply to economizers:

1. If the boiler blow-off valves discharge into a common header, see that the valves are blocked to prevent reopening.

2. Remove manhole and handhole caps.

3. Start boring the tubes and scaling the drums as soon as possible after the boiler is empty. Bore all tubes clean and clean all scale from the drums and headers. In boring the tubes the rules given on page 1418 of the June 16 issue ELECTRICAL WORLD should be followed.

4. Sweep the boiler.

5. Remove any obstructions in the air holes of the tuyère plates.

6. Clean all of the openings and holes in the dry pipes.

7. Clean the superheater. Owing to sharp curves and the presence of a core in some types of superheater tubes, it is difficult to get anything that will pass through them. A piece of cable stubbed on the end should be pushed through the tubes not having a core. The tubes should then be blown out with compressed air.

8. Give the water column a thorough inspection: (1) Remove the water glass, cut-out valves and gage cocks. (2) See that all connections are open and clean. (3) Replace the valves, gage cocks and glass. (4) Pack all valves on the water column.

9. Pack all valves on the boiler and blow-down valves.

10. Overhaul all safety valves.

11. Repair the brickwork.

12. Repair the piping.

13. The boiler inspector should make an internal inspection.

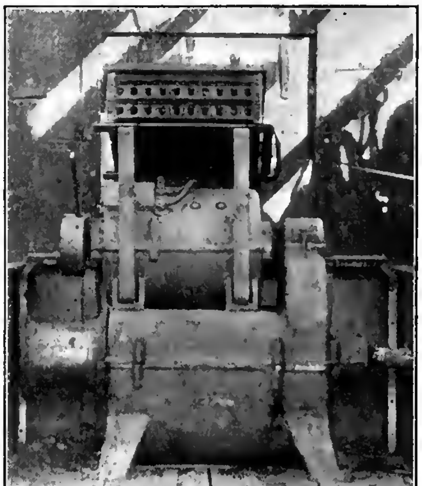
14. Head and cap up the boiler.

15. The boiler inspector should make a hydrostatic test. Care should be used in making the hydrostatic test to see that there is no leakage through the automatic non-return valve. If there is leakage, "blank off" at the automatic non-return valve. Do not allow the water to come in contact with the main stop valve. See that the drains between the main stop valve and the automatic non-return valve are open.

## Electric Truck Winch that Hastens Cable Laying

FOR speeding up the laying and removal of underground cable the Public Service Company of Northern Illinois has mounted an electric winch on one of its electric line trucks. This winch is driven by a 2½-hp., 1,500-r.p.m., motor operated directly from the 80-volt truck batteries. The entire outfit weighs approximately 1,500 lb. It has a gear ratio of 59.8 to 1 with over-all dimensions of 22.5 in. in length, 43.75 in. in width and 43.25 in. in height.

Although no operating costs have as yet been obtained, the winch has



MOTOR-DRIVEN WINCH EFFICIENT FOR LAYING AND REMOVING CABLE

installed 6,500 ft. of four-conductor 300,000-circ.mil cable and removed 5,000 ft. of the same size. The steady torque of the motor has helped in reducing sheath damage. The truck has been placed in service in the Oak Park district.

# Central Station Business

Advertising, Selling and Service Methods
Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences

## How to Pay Appliance Salesmen*

**With Central Stations Interested in Appliance Selling as Never Before, the Question of the Type of Salesmen and How to Pay Them Is of Vital Importance**

By Howard A. Lewis
Manager *Electrical Merchandising*, New York

CENTRAL-STATION companies have a certain advantage in employing house-to-house salesmen as each company represents a substantial investment in community service. As an institution the company is known. It is therefore theoretically easier for the central station to make use of house-to-house men, and the sales resistance to be overcome by the individual salesman is less because of the element of public confidence that automatically accrues to the advantage of the company's accredited representatives.

The central station's field man has the maximum of local public confidence in selling electrical merchandise. Other things being equal, a central station's salesmen should do a larger volume of business and should reach his average production in a shorter period of time than will the representatives of any other type of electrical sales organizations.

The above is the first factor to consider in making out a sales compensation plan. A minimum of public suspicion is a cash asset to the specialty worker. The time that a salesman must ordinarily spend in inspiring the prospective customer with confidence in his integrity can in the main be utilized in direct sales solicitation. An increase in the daily number of productive calls is the result.

If we take the local market price for consumer sales work and deduct 10 per cent from the gross commissions paid, assuming that all other factors are equal (merchandise handled, sales management, delivery, service, local advertising, etc.), we have the most elementary basis for a payment schedule. If vacuum-cleaner salesmen receive 20 per cent commission, the central station's schedule figured on the above basis could be 18 per cent.

The second factor to consider is the question of drawing account. Will the salesman finance himself or will the company underwrite all or part of his operations? A certain length of time is necessary before any new man, regardless of his ability, can earn a living wage. It is also true that with an established salesman there are lean weeks or months during a year's cycle. A straight salary basis is the maximum drawing-account arrangement. It is now an accepted principle that every salesman is on a commission basis even though paid a straight salary. No matter how they are arrived at sales costs must bear their proper relationship to gross income if profits are to be made. A salesman's salary and expenses must eventually be figured as a percentage of sales and rewards paid accordingly.

### Advance Cash a Problem

The real problem is how much cash to advance, if any, in anticipation of future sales. There are two sides to this problem, the company's and the salesman's. The company must consider first that the salesman may not make good, in which case all moneys advanced are wasted. This is a business risk which the company does not face if it operates on a straight commission plan. However, the company cannot control the activities of new men so closely when they operate on straight commission, and there is the practical danger of the salesman misrepresenting the merchandising and the company's policy in his anxiety to close sales. This makes for public ill will and kills the development of new "prospects." To overcome this objection to the commission plan, the company must have strong sales management, a sales plan and policy that is worked out in minute detail and actual field supervision by experienced men. This costs money and is apt to make for a high sales overhead expense.

The next factor is the possible dishonesty of the salesman. There is a small army of specialty salesmen who float from job to job. It is standard practice among some of these men to get cash advances, and then if sales do not materialize as quickly and as easily as anticipated they fade from the picture—whereabouts unknown. It is fairly easy for a company to be fooled by these men as they are plausible talkers and some of them are whirlwind salesmen—when they will apply themselves.

### Danger of Fly-by-Night Salesmen

A proper system in hiring men, a surety bond and a sales manager who knows the game will keep these losses down, even though a cash advance plan of payment is used. The greatest damage done by unscrupulous "fly-by-nights" springs from the dishonest statements made in selling. They make enemies for the company, but they are clever enough to cover their tracks temporarily, and the damage does not appear until after they have moved on.

It is standard practice with the larger central stations to operate their house-to-house crews on a straight commission basis.

These men are not left to their own devices; they are carefully supervised—either by the company direct or by the manufacturer whose product is being sold. This is particularly true with vacuum cleaners. Some of the results that are being obtained with this central-station, manufacturer, straight-commission plan of operation are astonishing. It requires high-pressure saleswork and is not a game for amateurs. The turnover of salesmen is very high, varying from better than 100 per cent a year to, in one case, 33⅓ per cent. The average is nearer 100 per cent.

With the smaller central stations which have had no experience with

*Abstract of the Merchandise Sales Bureau's sub-committee report, presented June 7 at the N. E. L. A. convention in New York.

this work and do not desire to turn over the operations of their retail department to a manufacturer's organization the house-to-house proposition is different. As a practical matter, it is cheaper for this type of company to get taken in on a cash-advance transaction early in the game than to have men working on a straight-commission plan without supervision, forcing up their sales at the expense of the company's future business and public good will. Professional house-to-house commission salesmen left to their own devices cannot be trusted.

### Drawing Account Is Necessary

As suggested above, the committee believes that with the smaller central stations which wish to operate one or more house-to-house salesmen a drawing account is necessary. What that drawing account should be brings us to the salesman's side of this problem. No definite figure can be set as to what the amount should be. It must depend first on the type of salesman that is required to sell a device or particular group of devices; second, on general living cost in the particular community, and, third, on the living costs of the kind of men that are selected. Are they married or single? Are they young college graduates or mature salesmen with families to support who have been making their living selling other specialties?

### Type of Selling

This brings us to the third and most important factor to be considered in this report—to wit, the different kinds of consumer soliciting required to sell electrical merchandise. As a practical sales matter it is a long haul from peddling flatirons and vacuum cleaners from door to door to the negotiations involved in the sale and installation of a domestic ice-making machine in the home of a leading citizen. The type of man who can peddle flatirons is not the type of man who can obtain the proper entrée and sell the big idea of domestic ice making to the leading citizens of the city.

As the committee views the problem, there are two kinds or types of consumer selling as applied to electrical merchandise—first, house-to-house peddling or canvassing with popular-priced devices like flatirons or such well known and easily demonstrated appliances as vacuum cleaners; second, for want of a better name, what might be called "negotiation soliciting." This covers the selling of higher-priced items, such as washing machines, ironing machines, ranges and domestic ice machines or unknown merchandise.

With house-to-house soliciting the outstanding sales factors are, first, the total number of calls that are made by the salesman each day; second, the salesman's skill in telling a short story at the front door to get attention and interest and the opportunity to demonstrate and show his device; third, ability to make a convincing demonstration quickly; fourth, a willingness to ask for the order; fifth, a persuasive yet courteous manner in meeting objections; sixth, personal qualifications that include persistency, vitality, enthusiasm, a thick skin and a reasonable amount of native courtesy plus honesty.

### Negotiation Soliciting

The factors in "negotiation soliciting" are, first, the selection of the right people to call on, based on their domestic problems, their financial status and their influence in the community; second, the proper introduction or stage setting before undertaking the sales talk that definitely leads to a demonstration; third, ability to make a complete educational demonstration; fourth, skill in talking the financial phases of the transaction, including the money-saving value of the merchandise in reducing labor and saving time and also the terms of payment; fifth, skill in pointing out the social values and prestige that would result from the purchase; sixth, closing ability; seventh, personal qualifications that include analytical ability, and education and a personality that will allow the salesman to mingle with all classes of society with a feeling of equality, a social sense, a respect for the job and an ability to make others respect it, which means a standing in the community on a par with a good life insurance man or bond salesman.

In the average town a house-to-house salesman working for a central station should be able to make \$100 to \$150 a month. An exceptionally good man should be able to average \$200 a month.

The local commission schedules must be so fixed that the man who makes a full number of calls six days a week can equal this amount. The Fuller Brush organization sets twelve demonstration calls a day as the bogey for a day's work.

During 1922 vacuum-cleaner salesmen averaged three machines a week, insuring a revenue of from \$30 to \$36 a week figured on a 20 per cent commission basis. These figures represent a national average for all vacuum-cleaner men working for manufacturers, dealers and central stations. The turnover, however, of vacuum-cleaner sales was high, a national average probably of 100 per cent a year. When you compare this with a yearly turnover of only 30 per cent, which is the average for one of the largest insurance companies, the sales waste in our industry is apparent.

The committee recommends that we make this task of "negotiation soliciting" a three-thousand-dollar-a-year job with a drawing account high enough to attract three-thousand-a-year men or better, and that we keep our nerve and do not reduce commissions should a good salesman make \$5,000 or \$6,000.

"Negotiation" type solicitors can be used permanently by small central stations as well as large.

An example: Given, a town with two thousand homes wired and no electrical dishwashers in use—possibly a 15 per cent saturation of washing machines, a 36 per cent saturation of vacuum cleaners and a 72 per cent saturation of flatirons.

### Effect of "Crowd Psychology"

A doorbell canvass of the entire two thousand wired homes might produce 5 per cent of sales with 95 per cent of the possible buyers registering a definite no. In a small community the women discuss among themselves their front-door experiences with canvassers. When the majority have said no to a proposition a negative "crowd psychology" develops which is intensified by the fact that each woman knows that her neighbor has also registered in the negative. The costs to the company in such a case are high and the returns to the salesman very low. On the other hand, suppose there is one high grade man assigned to the dishwasher. He knows his public and can get entrée. This man will select 5 per cent of the homes as his "prospects" and then set out and sell to these homes. The people he selects are community leaders. After sales are made to this 5 per cent, dishwashers will be known and talked about. There will be a favorable local opinion about washing dishes electrically as opposed to a wholesale "no," as under the first plan.

When this special salesman's bogey is reached, the town is then

ripe and ready for a doorbell attack, one of the big sales arguments being the local list of satisfied and happy users. Here we have a possibility of volume dishwasher sales, with the company making money and the salesmen satisfied. The special man then moves on to another device.

Regarding payment, while the "negotiation" man has the dishwasher, the commission is 20 per cent or 25 per cent; when the crews take it the commission is 15 per cent or possibly 12 per cent. By this plan, over a period of two years, the commission paid would be an average commission, the volume of sales larger, and all the salesmen better satisfied.

Good "negotiation" salesmen, over a period of time, finance themselves and can be made to show a profit to the company not only on the sales they make directly but from increased store sales. The specialties of yesterday are the staples of today.

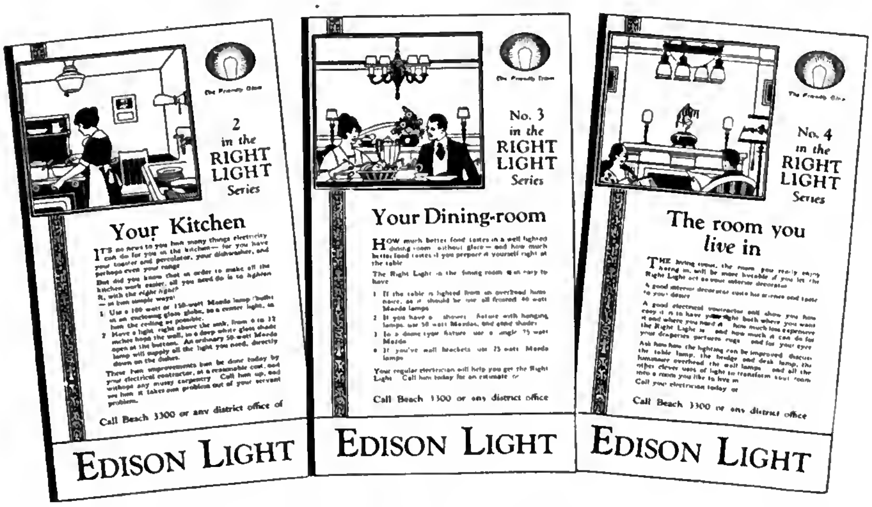
### The Sales Cycle

In this sales cycle of an electrical specialty the proper introductory placing of the appliance has much to do with the time it takes for the specialty to pass through the educational or novelty stage to the canvassing period and to over-the-counter distribution with a profitable volume.

With most central-station companies, if not with all, the washing machine, the ironing machine, the dishwasher, the range and the ice-making machine represent local sales problems that can be solved with "negotiation type" of salesmen. Each central station should develop a sales-payment plan for these "negotiation" men that will attract real brains and ability. The committee believes that the selling of these new electrical specialties should become a sales profession on a par with the best of insurance-selling practice. What is being done today with house-to-house peddling crews is not a precedent. The two types of selling are different—each has its place. Their functions must not be confused when making out payment schedules and building a sales organization.

## "Right Light" Publicity of Boston Edison

Keying its advertisements upon the term "right light," the Edison Electric Illuminating Company of Boston has recently prepared a series of announcements to be run before the end of June in Boston and suburban dailies and weeklies, including news and financial papers. The advertisements feature the value of proper illumination and adequate convenience outlets. What correct lighting means to the laundry, living room, kitchen, dining room and sleeping room is concisely explained in these advertisements, with recommendations for lamp sizes and fixture types.



PART OF A SERIES OF ADVERTISEMENTS SHOWING PROPER LIGHTING FOR THE HOME

Co-operation with the contractor-dealer is an important feature of these displays, the company sending inquiries to representative wiring firms upon request and advising consultation with reliable contractors before the purchase, sale or improvement of residences. The relation of good lighting to profitable real-estate handling is touched upon together with the economic aspect of paying for improved illumination on installments. L. D. Gibbs is superintendent of the advertising department of the Boston company.

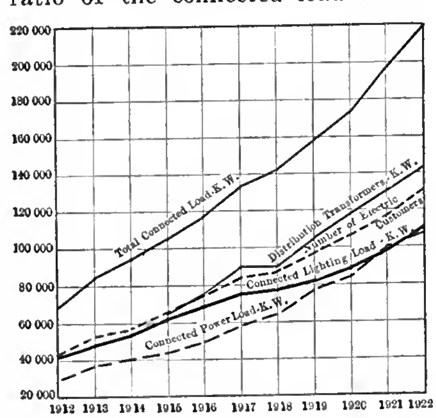
## New York Edison to Merchandise Small Power

With the expansion of its commercial policy to make it easier for customers to buy electrical appliances the New York Edison Company has adopted a practice of merchandising small power appliances and equipment to its existing customers which in the aggregate will bring a substantial increase in energy consumption and revenue. The company's power bureau is now making a survey of its present customers to determine the possibilities of adding to their equipment by the installation of small industrial heating devices, ventilating fans and refrigerating equipment.

To facilitate the purchase of this apparatus by the customer the company is extending the privilege of the deferred-payment plan, whereby the customer may pay for the apparatus in monthly installments extending over a period of one year. As a great deal of the manufacturing done in New York City is in small factories and shops having a connected load of approximately 15 kw., and under, it is believed that here is an almost unlimited field for development of the power load.

## Growth of Power Load in Northern Illinois

Analysis of the power load taken on by the Public Service Company of Northern Illinois in the last few years shows that while the ratio of the connected load to the



GROWTH OF CONNECTED LOAD ON LINES OF PUBLIC SERVICE COMPANY OF NORTHERN ILLINOIS

distribution transformer capacity for the years 1915, 1916 and 1917 had been 1.55 this ratio was lowered to 1.51 in 1922. This improvement was made despite the fact that the

power load connected had been increasing at a much faster rate than the lighting connected load. The present appliance load now forms between 10 and 35 per cent of the lighting load.

Examination of the accompanying chart shows that the connected power load gradually approached the lighting load until the latter part of 1920, when the power load exceeded the lighting load. But during the year 1922, because of the great home building program, the lighting load again exceeded the power load. It is expected, however, that during the next year or two the power curve will cross the lighting load, perhaps never again to be recrossed.

## Fresh Capital for Utilities Prevents Community Stagnation

ANOTHER effective advertisement run by the Haverhill (Mass.) Electric Company as part of its educational publicity program points out the importance of attracting capital for community development along essential electric service lines and

**More than $2,500,000 working for this community**

***Keep it working***

SUPPOSE this community had to raise $2,500,000 in order to preserve itself from stagnation—where would the money come from?

It would be drained from the industrial and commercial activities upon which the community thrives.

Yet this community would raise that money—no matter how industry and commerce suffered—rather than do without electricity. For electric light and power are absolutely essential to modern life—industrial, commercial, social.

More than $2,500,000 has been gathered, not *from* this community, but to work *for* this community. In other words, this community has hired that money to provide the power plants, service stations, lines, equipment, and organization necessary to supply electric light and power.

That money works for this community. It works for simple wages. It is entitled to those wages—to a fair rate of interest.

If those wages are not paid, no further money will be lent. If no capital is available, the public utilities cannot expand. And this community —or any other community—can grow no faster than its public utilities.

HAVERHILL ELECTRIC CO.

calls attention to the right of money to "simple wages" when engaged in this kind of work. The advertisement, the text of which is given here, is one of a series which is being prepared by Charles H. Tenney & Company, Boston, managers of the Haverhill and other Eastern utilities.

## Central Station Boosts Its Territory

AN EXAMPLE of how the utility can promote the interests of the territory it serves is seen in this electrical sign, containing 1,500 25-watt daylight lamps, which has been

CENTRAL STATION'S ELECTRIC SIGN BOOSTS TERRITORY SERVED

installed on the screen well of the Waterside station of the Louisville Gas & Electric Company. The sign announces to travelers that Louisville is the "Gateway to the South." It is 200 ft. above the level of the water and 150 ft. above the street level and can be read from the Indiana shore.

## Operating Costs of Electric and Gasoline Trucks

CAREFULLY kept operating costs of four electric trucks used by the San Joaquin Light & Power Corporation indicate that the cost of operation for the first month the trucks were in service was less than half the operating cost of gasoline trucks of the same size.

The table below shows the cost of power per mile for the electric trucks as compared with the cost of gasoline and oil used by gas trucks of the same capacity. The average per ton-mile for the electric trucks was 2.07 cents, while for the gasoline trucks it was 4.16 cents.

COST IN CENTS PER MILE TO OPERATE ELECTRIC AND GASOLINE TRUCKS

| | Capacity, Tons | Electric, Cents per Mile | Gasoline, Cents per Mile |
|---|---|---|---|
| Truck No. 1 | 0.75 | 1.73 | 2.20 |
| Truck No. 2 | 1 | 2.63 | 5.77 |
| Truck No. 3 | 2 | 3.27 | 9.91 |
| Truck No. 4 | 2 | 3.47 | 6.17 |
| Average per ton mile | | 2.07 | 4.16 |

This study was made from carefully kept costs for one month for the electric trucks and from records of gasoline cars extending over a period of several years. In the opinion of the engineering department which made the analysis the cost of operation for the electric trucks will be even lower than is shown by the first month.

## What Other Companies Are Doing

**Franklin, Mass.** — Twenty-five electric ranges were sold in two weeks recently by the Union Light & Power Company, which serves about 3,700 customers in southern Massachusetts. Fifty vacuum cleaners were sold during April on the basis of an allowance of $3 for each old broom turned in. E. S. Hamblen, manager, states that merchandise sales per customer for the company in 1922 were $15.20. This is believed to be a record in this line. L. A. Fiorani is commercial manager.

**Nyack, N. Y.**—In selling 130 vacuum cleaners of a single make in its first month of a campaign recently the Rockland Light & Power Company, a Tenney property, created a new record in cleaner sales for upstate New York. This applies to any organization in the state other than in Brooklyn or New York City, and the company hopes to exceed 1,000 cleaner sales of this type during the year.

**Minneapolis, Minn.**—"The Woman in the Case" is the title of an interesting brochure which the Northern States Power Company has prepared in furthering its customer-ownership plan. It deals with the problem of systematic saving which confronts a newly married couple and brings out the advantages of public utility stock. The story is a narrative of how they progressed toward true economy instead of drifting without any systematic program of saving. The booklet also explains the physical property behind the company's stock.

**Hartford, Conn.**—Plans are afoot to carry on the work of the battery and vehicle department of the Hartford Electric Light Company as a separate corporation to be known as the Electric Transportation Company, Inc. The new organization will take over the company's garage, offices and service station and will continue to operate the battery service system for electric trucks which has been so popular in that city for the past few years. W. M. Thayer is in charge of the battery and vehicle department.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Water Turbines and Regulators for the Ritom Power House.*—V. GELPKE.—The extraordinary requirements of safety and flexibility of operation imposed upon its power houses by the Swiss Federal Railways, particularly in the case of the Gotthard road, necessitated installing in the Ritom hydro-electric power station water turbines, regulators and hydraulic controlling devices which represent one of the most difficult and exacting installations of the kind. The 12,200-hp. single-runner Pelton turbines, operating under a head of 800 m., reach a peripheral speed of 60 m./sec. (333⅓ r.p.m.) impelled by a single water jet of 123 mm. diameter, with a nozzle velocity of 120 m./sec. The turbine and directly connected single-phase generator of 9,000 kw. have been tested at 608 r.p.m. (82 per cent overspeed), under a load of 11,300 hp. with no damage to the set. Needle regulation combined with a jet deflector are provided, both operated by high-pressure servo-motors. An auxiliary water jet, impinging upon the backs of the buckets, reduces the time to stop the set from one hour to three minutes. The article contains eighteen drawings of the complete turbine.—*Zeitschrift des Vereines Deutscher Ingenieure*, May, 5, 1923.

## Transmission, Substations and Distribution

*Terminal Boxes for Lead Cables in Farm Installations.*—E. RAGER.—Lead cables are being used to a great extent in farm installations. Certain difficulties have been encountered in making the connections in such a manner as to exclude the humid air. The author describes a system of terminal boxes which, he claims, will obviate the disadvantages of the old system.—*Teknisk Tidsskrift, Elektroteknikern (Danish)*, March 21, 1923.

*Fire Risk from Poorly Made Farm Installations.* — K. SCHNEIDERMANN. — The constantly increasing number of fires due to poorly installed light and power lines on German farms has resulted in a systematic investigation of a great number of installations. The author gives an extremely interesting account of conditions found on some of these farms and describes the cause of a number of great farm fires. Twenty illustrations give vivid evidences of electric failures, due to carelessness, incompetence or defective material, some of which were discovered in time, but many only after a fire.—*Elektrotechnische Zeitschrift*, April 19, 1923.

*Alternating-Current Secondary Networks.*—D. K. BLAKE.—Great attention has been paid to every detail of power-station and substation equipment and also to the details of transmission lines, but in the past such minute study has not been given to the distribution system. The author takes up this study and treats it in detail in a way that should be of interest to those responsible for the distribution of energy.—*General Electric Review*, June, 1923.

## Generation, Control, Switching and Protection

*Isolated Phase Arrangement of Switching Equipment.*—P. M. CURRIER and W. T. O'CONNELL. — The authors fully describe the "isolated-phase" construction for switching equipment and explain the merits of the system. The vertical and horizontal construction are discussed, and illustrations emphasize the points brought out. Attention is called to the fact that when the phases are isolated phase-to-phase short circuits will be practically eliminated.—*General Electric Review*, June, 1923.

*Calculation of the Dimensions of Oil Circuit Breakers.*—P. CHARPENTIER.—The design of oil circuit breakers, from both the electrical and the mechanical viewpoint, should be based upon the known short-circuit conditions of the circuit in which the breaker is to be used. From an extended study of arcs under oil the author gives a formula for the amount of gas generated by an arc of known energy and duration. This amount of gas, the writer assumes, forms a more or less cylindrical gas pocket within which the ionized gas may be considered as electrically conductive. The transient dimensions of this pocket give, therefore, the required minimum distances between phases of the breaker and between phases and tank walls. The height of the switch tank is determined by the length of the arc, the dimensions of the contacts and the safe oil level above the contacts. To insure the theoretically most advantageous break within half a cycle an entirely too high speed of opening would be required, such as, for example, more than 100 miles an hour for 50,000 volts. In practice one-tenth of this speed is usually the limit. The creation of a vacuum under the oil because of a too rapid motion of the contacts is not to be expected unless the speed of the contacts should exceed 130 miles an hour, assuming a pressure of 5 atmospheres in the immediate vicinity of the break. On checking up the characteristics of existing switches, the author's formulas were found to come within 2 per cent of their dimensions and rupturing capacities. The reticence observed by American designers of switchgear is regretted by the author, who makes the assumption that, if these formulas give such close results, discretion may serve to cover up the possible embarrassment of finding a switch to be either entirely inadequate or too large and costly for the purpose for which it is used.—*Revue Générale de l'Electricité*, May 5, 1923.

## Units, Measurements and Instruments

*Electric Testing Laboratory of a Porcelain Factory.*—P. CRUSSARD.—A laboratory for routine testing of porcelain insulators is described, consisting of a 60-hp. motor-generator set supplying an oil-insulated testing transformer, with series-parallel arrangement of the low-voltage winding to obtain either 125 kv. or 250 kv. on the high-voltage side. The voltage of the single-phase generator on the motor-generator can be regulated from 15 to 500, which gives the wide range of testing voltages on the secondary of the transformer. Three sphere gaps of balls 62, 125 and 250 mm. in diameter are provided to measure voltages of up to 90 kv., 180 kv. and above, respectively. A voltmeter in the low-voltage circuit of the transformer, graduated in values of the high-voltage winding, gives readings previous to the flashover of the spheres. The usual apparatus for rain tests is installed. Safety switches are provided, opening the circuit when the gate to the high-voltage room proper is opened.—*Revue Générale de l'Electricité*, May 5, 1923.

*Permissible Loading of Cables.*—The permissible current loading of British standard impregnated paper-insulated electric cables, as specified in the report of the British Electrical and Allied Industries Research Association, is given. The report includes current-loading tables for cables laid directly in the ground, in the air and drawn into ducts. A great deal of theoretical and experimental work, as, for instance, on power losses in the cable, dielectric constants, thermal constants, current rating, etc., is also included. The tables are for 600-volt to 11,000-volt cable, single-core, concentric and three-core.—*Journal of the (British) Institution of Electrical Engineers*, May, 1923.

## Illumination

*Transmission of Speech by Light.*—A. O. RANKINE.—The transmission of speech by light is effected by modulating the intensity of a beam of light by means of the acoustical vibrations. In the distance the fluctuating beam falls upon the receiver, a selenium cell in circuit with a battery and telephone. The selenium can control the current because it is a better conductor of electricity when illuminated than when in darkness. Thus the brightness of the light and the telephone current vary in correspondence with speech vibrations. In the method described by the author he stated that the transmission

of speech by light still depended upon selenium, though he would gladly abandon selenium in favor of a superior substitute. — *Engineering (London)*, April 27, 1923.

*Artistic Color Lighting in Motion-Picture Theaters.*—S. L. ROTHAFEL.—The lighting effects produced by the author at the Capitol Theater, New York, are the result of study of the psychology of the audience. He has found that the ideal lighting arrangement is soothing to the mind and nerves and at the same time stimulating to the imagination. As a result of this theory he describes the way he builds the lighting effects for various units or parts of a program.—*Transactions of the I.E.S.*, May, 1923.

### Motors and Control

*Electrification of Allegheny Plate Glass Company.*—G. P. WILSON.—Primarily the author discusses the modern developments that have taken place in the plate-glass industry. Many of the processes are quite complicated, but the real solution of most of the problems has been made simple and practical by the use of electricity. The author gives a clear idea of the extent to which electricity is being used in glass plants and then briefly traces the process through which the ingredients must pass and how they are handled before a finished sheet of glass results.—*Electric Journal*, April, 1923.

*Operation of Low-Speed Elevator Electric Motor Controller.*—C. A. ARMSTRONG. — A detailed explanation is given of the controller's operation, after which a number of the troubles which may develop are enumerated and the methods for locating them explained.—*Power*, May 1, 1923.

*Synchronous Motor-Generators for Coal Mines.* — E. J. GEALY. — The author discusses the relative advantages and disadvantages of synchronous motor-generators and rotary converters for coal mines. Present tendencies show that the former may take the place of the latter. Of the two machines, the motor-generator seems to be better adapted for the purpose on account of greater stability, less complication, easier operation and greater adaptability to the coal-mine load, which is very irregular in character.—*Coal Age*, May 3, 1923.

### Heat Applications and Material Handling

*Electric Furnace Detinning and Production of Synthetic Gray Iron from Tin-Plate Scrap.*—C. E. WILLIAMS, C. E. SIMS and C. A. NEWHALL.—Experiments were conducted in a small electric furnace in which tin-plate scrap was melted with different addition agents in attempts to remove the tin from the iron. Sodium chloride, iron sulphide and an oxidizing slag were used under various conditions. The conclusions reached were that in the electric furnace complete detinning is impossible and any detinning impracticable. Melting tests conducted in the cupola showed that the amount of detinning was dependent upon the amount of surface of metallic tin exposed to the oxidizing gases and will be somewhere between the limits of 0 and 50 per cent. Test bars, prepared by melting pig iron with various quantities of tin, were subjected to physical tests. The results showed that a tin content of 1 per cent or less did not seriously affect the properties of gray iron. —*Paper presented before the American Electrochemical Society, New York*, May 3-5, 1923.

### Electrophysics, Electrochemistry and Batteries

*Copper Electric Plating Applied in Metallurgy.*—A. BARATTINI.—It is well known that copper electric plating is used in steel-case hardening to maintain elastic resistance and facilitate the treatment of certain parts of the metal. For example, in hardening a gear copper plating is used at the points of the teeth. Its use forms the subject of this article, in which the author fully describes the latest improvements made in this method, giving scientific and industrial examples. — *Elettrotecnica*, April 15, 1923.

### Traction

*Self-Propelled Electric Locomotive.*—P. OSTERTAG.—A full description, with many illustrations, of the new self-propelled electric locomotive recently tested in Switzerland. This car, which is to operate light trains only, is equipped with a 200-hp., 440-r.p.m. Diesel engine which drives a direct-current generator, the latter energizing two direct-current motors. Benzol is used as a fuel on account of the high cost of gasoline, and its consumption is very reasonable. The maximum speed obtained is 45 miles per hour.—*Ingegneria*, Feb. 1, 1923.

*Observations on Electric Railway Practice.*—W. P. POTTER.—An abstract of this paper may be found in the ELECTRICAL WORLD report of the A. I. E. E. midwinter convention, Feb. 24, 1923, on page 441.—*Journal of the A. I. E. E.*, May, 1923.

### Telegraphy, Telephony, Radio and Signals

*Impedance of Smooth Lines and Design of Simulating Networks.* — R. S. HOYT.—In the first part of the paper the author presents in a comprehensive manner the dependence of the characteristic impedance of the various types of smooth lines on frequency and on the line constants by means of descriptions accompanied by equations transformed to more suitable forms by graphs. In the last part of the paper he describes the principal networks devised for simulating the impedance of the various types of smooth lines.—*Bell System Technical Journal*, April, 1923.

*Radio Transmission Measurements.*—R. BROWN, C. R. ENGLUND and H. T. FRIIS.—The first section of the article briefly analyzes the radio transmission circuit into (a) the sending or radiating portion, (b) the transmitting portion, consisting of the ether path through which the radiated waves travel, and (c) the receiving portion. The relation of these from the standpoint of the radio transmission engineer is discussed, pointing out the need of quantitative data as to the electric field strength of waves and radio noise conditions to allow the rational design of radio systems. The second section is devoted to descriptions of apparatus which has been developed for measuring the electric field strength of the radio waves, its theory and method of use. The third section deals with the measurement of radio noise.—*Proceedings of the Institute of Radio Engineers*, April, 1923.

*Experiments with the Neon Tube.*—S. O. PEARSON.—The author explains how the neon lamp can be made to produce oscillating current, thus making it applicable for using with radio equipment. He describes how an instrument could be made up giving a whole range of note frequencies, either in steps or continuous. This instrument can be used to determine frequency. As an instance he mentions that the apparatus could be used in testing low-frequency amplifiers over a wide band of speech frequencies, making it possible to detect undesirable resonant frequencies in the amplifier.—*Wireless World*, April 7 and 14, 1923.

*How to Measure Antenna Resistance and Capacity.*—A. F. MURRAY.—Unless the resistance and capacity of an antenna are known the power output or the transmitter efficiency cannot be determined. The author gives a method, known as the substitution method, in which a dummy antenna with the same constants as the actual antenna is built up and measured.—*Q S T*, May, 1923.

### Miscellaneous

*Problems Confronting the Engineering Profession.* — L. W. WALLACE. — In the opinion of the author, engineers have in the past neglected many factors of importance with which the engineers of today must wrestle. There are many phases of industrial leadership yet unsolved, relating particularly to the distribution, financial, production and human factors of industry. The report indicates many fields in which there is ample opportunity in American industry for the engineer to do splendid work. It is the duty and responsibility of the engineer to study and help solve the problems encountered today, and by virtue of his engineering education he is in a position to do this.—*Sibley Journal of Engineering*, April, 1923.

*Oscillations by Breakdown of Condensers.*—R. RUEDENBERG. — Formulas for current and frequency of the arc are deduced in an investigation of an undamped circuit presupposing invariability of sum of magnetic and electrostatic energy. The frequency and the current of a thunderbolt depend on the diameter of the cloud, not on the elevation. — *Tydschrift voor Electrotechniek*, May, 1923.

## World Power Conference

### Active Participation of the United States in 1924 London Meeting Voted by National Societies

THE United States will be an active participant in the World Power Conference to be held in London, England, in 1924. This was decided at a meeting of delegates chosen from the various national professional, technical, business and commercial societies, including representatives from the national government, held in New York City on Wednesday of this week. The plan of organization, drawn up by a sub-committee of which John W. Lieb of the New York Edison Company is chairman, was adopted, and the following officers were elected: Honorary chairman, J. W. Weeks, Secretary of War of the United States; chairman, O. C. Merrill, executive secretary Federal Power Commission, Washington; first vice-chairman, Henry J. Pierce of Seattle.

#### Committee of One Hundred

Three other officers elected but without particular designation were: Calvin W. Rice, secretary of the American Society of Mechanical Engineers; Peter Junkersfeld of the firm of McClellan & Junkersfeld, consulting engineers, and W. M. Steuart of the Census Bureau, Washington. According to the present plans, the American committee, World Power Conference, will be made up of a general committee of approximately one hundred with a small executive committee of from nine to eleven persons.

L. B. Stillwell, consulting engineer, New York, outlined some of the work which the committee might profitably undertake, with particular reference to power development in the North African colonies of France. He suggested that the financial and legal as well as the engineering phases of power development should have ample consideration.

H. I. Harriman, banker and public utility operator of Boston, representing the American Chamber of Commerce, laid particular emphasis on the advisability of delegates from the United States dwelling on the economic and political features of power development. He was insistent that the world should know that this nation has made wonderful progress along these lines, chiefly because it stood for private ownership and the exercise of private initiative.

W. H. Onken, Jr., Electrical World, New York, recommended that the United States contribute to the conference certain outstanding features of power development in which it leads the world, including hydro-electric development, electric transmission and interconnection of superpower systems. These are almost universal in their application and on them the United States better than any other nation can make authoritative contributions. The advantage of concentrating on a few subjects of worldwide interest was emphasized.

It was the general understanding that all delegates to the World Power Conference will pay their own expenses and that none of the professional and business associations will be called upon to make any contributions toward operating expenses of the committee.

## Dayton to Be Center of Large Interconnected System

Announcement has been made by the Dayton Power & Light Company that arrangements have been completed for interconnecting power stations with an aggregate capacity of 250,000 hp. at the Miller's Ford station. This, the company says, will make Dayton the center of a "superpower" zone unequaled in that part of the country. The stations to be connected with the Dayton plant are the new West End generating lines of the Union Gas & Electric Company of Cincinnati and two smaller hydro-electric plants at West Milton and Covington. The steam generating plant of the Dayton, Covington & Piqua Traction Company at West Milton will be abandoned under the plan.

## Electro-Steam Boiler Installed at Berlin (N. H.) Mills

The use of excess hydro-electric power for the generation of steam has received a new exemplification at the mills of the Brown Company, Berlin, N. H., where the Electric Furnace Construction Company of Philadelphia has just installed an electro-steam boiler rated at 18,000 kw. and operating at 22,000 volts, three-phase, 60 cycles, with a steam pressure of 135 lb. gage. The boiler consists of three single-phase tanks. This is said to be the only boiler ever installed to operate at so high a voltage, and, according to the manufacturer, the results obtained from its use are remarkably gratifying, surpassing the expectations of both the Electric Furnace Construction Company and the Brown Company.

## Pennsylvania Power Acts

### Résumé of Legislation of 1923 Affecting Hydro-Electric Development and Other Power Projects

THE program of power legislation advocated by Governor Pinchot of Pennsylvania was completed by the passage of the general power bill and the companion condemnation bill on the last day of the legislative session. It included the preparation of what the administration terms sound and far-seeing plans for the future as well as provision for present needs.

#### "Giant Power Survey"

Most significant for the future is the act creating a "giant power survey board" composed of high state officials including the Governor in addition to a deputy attorney-general and an engineer to be appointed by him. This board is to make an outline survey of the power resources available for the supply of Pennsylvania's needs and will recommend a policy to be embodied in legislation by the General Assembly convening in January, 1925. The end in view is the most efficient development of the state's great fuel-power resources, supplemented by water power, the pouring of the general output of these fuel and water-power resources into a common reservoir of interconnected transmission lines covering the Northeastern States and the service of the industries, farms and homes of Pennsylvania from this common reservoir. The possibilities and advantages of locating great power plants at the coal mines, saving the by-products of coal now wasted in fuel-power plants, electrifying railroads and co-ordinating flood prevention and stream purification, so far as practicable, with water-power development are to be investigated.

#### The Tri-State Compact

Related to the "giant power survey act" is the act authorizing the Governor to designate three officers of the commonwealth to negotiate with New York and New Jersey a compact for the regulation of the Delaware River and the apportionment of its waters. New York and New Jersey have passed similar statutes carrying appropriations for surveys and plans. Such a compact negotiated with the consent of Congress will be binding upon all interests when ratified by the three states. The complete regularization of the Delaware by storage of the whole flow, thus preventing floods, will develop power estimated at 400,000 hp.

Present needs are met by an act

regulating future permits granted by the Water Supply Commission for dams and changes in streams to develop water power and to store and use water for steam raising and steam condensation in the generation of electrical energy for use in public service.

As to future permits the principles of the federal water-power act are to be applied. If the waters concerned are under federal jurisdiction, the state permit will be contingent upon the permittee's obtaining a federal license, the conditions of which may be enforced by the commonwealth if and to the extent that the federal government is unable to enforce them or waives them. If the waters concerned are not within the jurisdiction of the United States, the act fixes a maximum time limit of fifty years with extensions and renewals until the capital prudently invested on the faith of the permit has been repaid by the commonwealth or by a new permittee. It also gives to the state broad powers to impose conditions like those in a federal license. A system of fees will be established to pay the cost of administering the act. The right to flood islands owned by the commonwealth, hitherto inalienable, may be granted by the board.

A companion act restores to public service companies holding permits the right to condemn waters and lands under water which was taken away by the Pennypacker act of 1905; their condemnation rights are enlarged in other respects and they may flood, relocate and reconstruct highways, bridges and railroads. The exercise of all these powers is to be controlled at every step by the board.

Another act authorizes the Department of Forests and Waters to lease state forest lands for power projects for periods not to exceed fifty years.

## Premier Drury of Ontario on Public Ownership

Premier E. C. Drury of the Province of Ontario, Canada, has given to the press an appeal addressed to the electors in which he sets forth the achievements of his government since taking office in 1919 and a declaration of his policy for the future if his government is returned to power at the provincial election to take place next Monday. Of interest to public utility men everywhere are his remarks under the head of "Public Ownership," which follow:

"The government is not opposed to the public ownership of public utilities, nor is it antagonistic to hydro-electric development. Our policy is to give every possible support to undertakings of this nature. We stand for two definite principles which are essential to the success of public ownership—first, for definite responsibility on the part of commissions and others engaged in carrying out public-ownership projects to the government and to the Assembly and through them to the people; second, for such care in the projection and execution of public ownership undertakings as will insure that they shall be entered into only after the most careful and accurate estimates, and that they shall be carried out with such economy as will enable them to attain the utmost of efficiency. It is our policy that each public ownership undertaking shall be self-sustaining and that no such undertaking shall be a burden upon the general taxpayer."

## Quebec Premier on Private Versus Public Ownership

Louis A. Taschereau, Premier of the Province of Quebec, in a recent speech said that the prosperity of the province, and, in fact, of all Canada, depended upon increased production, particularly of goods which would find a ready market in the United States and that this industrial development would require tremendous electrical development.

"There are two systems of developing water power," continued Premier Taschereau. "One is the Ontario scheme, by which the government does the work through the Hydro-Electric Commission, and the other is the system in Quebec, by which the government undertakes no obligation itself, but leaves it to private initiative, with the aid of all possible facilities that the government can grant."

Without criticising the Province of Ontario, he pointed out that it had incurred a debt of $250,000,000 for a population of less than three million people, while the debt of the Province of Quebec, with a population of nearly as much, is only $52,000,000.

"We prefer our system of leaving it to private initiative to develop the water power," said the Premier. "By so doing we shall succeed in bringing many millions of foreign capital into our province. Furthermore, if you leave the development of water powers to private initiative, you are keeping the water powers out of the vicissitudes of politics. A government cannot put the technical knowledge and energy into such development works that can be supplied by a private concern."

## Well-Known Men Win Prizes for Electrified Houses

An entirely new "side issue" at the recent convention of the National Electric Light Association in New York was a contest held under the auspices of the Joint Committee for Business Development to award prizes to those whose houses were most fully electrified. This contest was remarkable for the interest it aroused among well-known men of the industry who were attending the convention. Many of them entered the lists as competitors.

W. D'A. Ryan of the General Electric Company, Schenectady, N. Y., with a total of 343 points, was adjudged winner of the contest. C. W. Stone, also of the General Electric Company, was second with 327 points; Samuel Ferguson, vice-president Hartford Electric Light Company, third with 309 points, and C. L. Edgar, president Edison Electric Illuminating Company of Boston, fourth with 307 points. Then followed W. E. Holmes, Newton, Mass., 273 points; F. B. Steele, Utica, N. Y., 266 points; Thomas W. Drought, Broadalbin, N. Y., 256 points; L. L. Elden, Boston, 250 points; Steele R. Sellers, Pittsburgh, 241 points, and Ralph D. Cutler, Hartford, 231 points. Many others got honorable mention.

The prizes were given by *Electrical Merchandising*, and James R. Strong, A. K. Baylor, R. S. Hale and Miss Alice Carroll were the judges.

## S. P. E. E. Gathers at Ithaca

### Educational Research Project to Be Carried Forward by Director and Advisory Board

ENGINEERING leadership and educational research were leading topics at the annual meeting of the Society for the Promotion of Engineering Education at Ithaca, N. Y., on June 20 to 23. More than 300 leading educators from all sections expressed an enthusiastic desire to carry forward the educational research project formulated by two years' work of the committee of investigation and co-ordination. This calls for the investigation of the objects of engineering education and the best curriculum to attain the desired ends. A director is to be appointed, with an advisory board, and Dr. H. S. Pritchett of the Carnegie Corporation has recommended to his directors and to other foundations the expenditure of $108,000. Action is to be taken immediately by appointing a faculty committee at each school to cooperate with the director.

At the opening meeting on Wednesday afternoon Dean D. S. Kimball gave a notable address on training for leadership. He said that precedents were lacking whereby legal leadership in the nation could codify past experiences and that the present epoch utilized pure and applied science so greatly that the engineer was needed. The fundamental curriculum, he thought, should not be changed as such a practice would undermine the standing of the engineer which has been built up over many years. Hope for solving present problems lies in the application of engineering principles by the industrially intelligent, and the present era calls for universal wellbeing, not private, state or corporate profits. In the opinion of Dean Kimball, the chief trouble with the present curricula as regards training leaders is that they afford no historical background. There is also an insufficient number of inspiring teachers.

Excellent arrangements were made for caring for visitors in the Cornell University buildings, and many entertainment features were provided for the visiting ladies. On Wednesday night President Farrand of the university welcomed the members of the society, and President C. F. Scott of the society responded, after which an informal reception was held.

## Baltimore Rates Reduced

### Maryland Commission Fixes Prices Designed to Save Consumers of Energy $700,000 a Year

FIXING a valuation of $81,400,000 on the property of the Consolidated Gas, Electric Light & Power Company, which is $31,200,000 less than the figure arrived at by the company's expert, the Maryland Public Service Commission has ordered a reduction in gas and electric rates, effective July 1, designed to save consumers $1,350,000 a year, while still preserving 8 per cent dividends.

A radical cut is made in the gas department, where $650,000 is to be saved to consumers. The 8-cent primary rate for electricity is not reduced. Electric bills of domestic consumers are reduced, however, by cutting the secondary rate from 5 cents to 4 cents and bringing the secondary rate nearer the primary rate. Consumers hereafter will go on the secondary rate after having used 40 kw.-hr. of energy at the primary rate instead of 50 kw.-hr. No reduction was made in the primary rate because it was demonstrated at the rate hearing that this rate was not compensatory and that it actually cost more to serve those whose entire bills fell within it than the amount they paid the company.

The power rates were reduced about 20 per cent. The commission refused to abolish the fuel rate adjustment and the rates will fluctuate, as heretofore, according to the changes in the price of coal. The base rate will, however, change according to the changes in the price of coal above $5 per ton, instead of $2.70 per ton as heretofore, the variation being one-hundredth of a cent for each 9 cents change in the price of coal instead of for each 3 per cent.

Savings to householders in electric bills are expected to amount to $350,000 a year, and savings to users of electricity for power to $350,000 a year.

The commission's action takes from the company a little more than half the amount of its surplus after dividends and all expenses are paid, and, according to members of the commission, divides between the company and its customers the results of prosperity.

In its decision the commission said:

"There were five estimates of value presented to the commission. We have given careful consideration to every item of each. We cannot adopt the company's 'reproduction cost new' appraisal as the rate base. It would be unfair to the patrons and, we believe, unwise for the company to urge it. The banking and investing public would not accept it. From a long experience with the company, and from a study and consideration of the entire testimony, we are convinced that the security issues now outstanding represent par value in property, a belief evidently shared by the banking fraternity and investing groups."

COMPANY TO ABIDE BY ORDER

Herbert A. Wagner, president of the company, gave out this statement:

"The decision of the commission resulting in a reduction of both gas and electric rates amounting in money to $1,350,000 a year (or nearly $4,000 a day) comes after the most exhaustive inquiry into the conduct of our business that has ever taken place. We have no comment to make as to the commission's point of view.

"Baltimore has been enjoying gas and electric rates lower than those in any other city on the Atlantic seaboard. Now they have been made still lower. In fact, the electric rates for domestic and commercial consumers are now made lower than the pre-war rates, in spite of the fact that commodities generally are still at least 60 per cent higher than before the war.

"The reduction in rates is most drastic and such as we could not have anticipated, but we will accept and obey the commission's order in the best spirit we can and, with the continued co-operation of our customers, will do our best to furnish good service at the exceptionally low rates prescribed."

## Stone & Webster, Inc., to Manage Jamaica Public Utility

Stone & Webster, Inc., Boston, have been appointed managers of the Jamaica Public Service Company, Ltd., recently organized by Montreal banking interests to carry on the electric lighting, power and street-railway business of Kingston, the capital and chief town of the British West Indian island. The financing of the new company is being handled by a syndicate headed by Greenshields & Company and including Æmilius Jarvis & Company and Mackenzie & Kingman, all of Montreal. The West Indian Electric Company, Ltd., and the Jamaica Electric Light & Power Company, Ltd., formerly operating in Kingston, have been purchased. The new company will also serve the parishes of St. Andrew and St. Katherine, the territory having a population of 125,000.

Alfred S. Nichols, for the past six years manager of the Paducah (Ky.) Electric Company, has been appointed manager of the Jamaica company, and Roy S. Nelson, formerly chief engineer of the Eastern Texas Electric Company's generating plant at Port Arthur, Tex., will take charge of the generating plants.

## California Oregon Seeks to Acquire Douglas County

The California Oregon Power Company has made application to the California Railroad Commission for permission to exercise an option for the purchase of the plant and properties of the Douglas County Light & Water Company, which is engaged in the business of generating and distributing electrical energy and water in Douglas County, Ore., and Siskiyou County, Cal., for a purchase price of $600,000. The proposed purchase and merger of the Douglas County Light & Water Company is to be made effective as of July 1, 1923. Headquarters of the Douglas County Company are at Roseburg, Ore.; it has a hydro-electric and a steam auxiliary station at Winchester, Ore., and serves a population of more than seven thousand.

## Alabama Power Gross Earnings Increase $1,200,000

Net income of the Alabama Power Company for 1922 was $573,606, after deductions for interest, taxes and depreciation, or an equivalent of $3.06 a share on the $18,750,000 common stock outstanding. The gross earnings were $5,865,906, compared with $4,629,477 for the previous year.

"This increase," the report just issued says, "was due almost entirely to an increased volume of business in both wholesale and retail electric operations, new services to communities and industries and also from the sale of energy to public utility companies in adjoining states. There was no material increase in the street-railway and gas earnings."

Net operating revenue for the year 1922 was $5,745,320, while net earnings from operation were $2,750,721.

## Indianapolis to Have Large Automatic Substation

A large automatic direct-current substation will soon be in operation by the Indianapolis Light & Heat Company in a remodeled substation building in the rear of the company's offices. The substation, which will contain three motor-generator sets, will have a capacity of 4,000 kw. Two new units that have been put in place recently have a capacity of 1,500 kw. each, and an old unit of 1,000 kw. has been included in the new system. The substation improvements were made at a cost of approximately $700,000.

The machines start and stop themselves as the consumption of energy on the lines justifies an increased or decreased load. In case of mechanical trouble within a machine, such as an overheated bearing, it stops automatically and relays ring a bell, notifying attendants that something is wrong with the equipment. If any part of one unit should become inoperative, the machine is brought to a stop and an undamaged unit is automatically started. The new units will attain the maximum load in twenty seconds from a dead start, whereas the old type of machines require from three to four minutes.

Charles C. Perry, president of the company, said that the substation is to be made a battery-protected station. The battery equipment has been ordered and will be installed in a few months. This will give the company four battery-protected substations to insure against interruption of service in that part of the city receiving direct-current service. In addition to the four battery-protected and direct-current substations the company operates two substations that do not have the battery equipment.

In the past year the company has spent more than $1,000,000 in making additions to its direct-current equipment. Mr. Perry said that underground lines have been placed in the business district which will meet the requirements of a city of a million population. The capacity of the direct-current substations has been increased practically one-third by the improvements.

# Louis Bell Dies at His Home

## Distinguished Electrical Engineer, Authority on Power Transmission and Illumination, Passes Away at West Newton, Mass., at the Age of Fifty-eight

ELECTRICAL engineering suffered another loss on Thursday, June 14, when Dr. Louis Bell, well-known consulting electrical engineer of Boston, died at his home in West Newton, Mass., at the age of fifty-eight. Dr. Bell had been in poor health for some time, and the news of his death, lamented as it was, was not unexpected by his friends and associates. Simple funeral services were held at his home on Saturday, attended by many prominent in electrical and professional circles from Boston and elsewhere.

Louis Bell was born on Dec. 5, 1864, in Chester, N. H. He was graduated from Dartmouth College in 1884 and received the degree of Ph.D. from Johns Hopkins University in 1888, after specializing in physics. In the latter year he joined the faculty of Purdue University at Lafayette, Ind., as professor of physics and applied engineering. Here he organized the department of electrical engineering. In 1890, after a year of engineering practice in Chicago, he became editor of the ELECTRICAL WORLD, retaining that post until 1892, when he resigned to become chief engineer of the newly organized power transmission department of the General Electric Company. His pioneer work in this connection was of the greatest importance in placing this branch of the art on a commercial and an engineering basis. As engineer for the General Electric Company he designed and installed at Redlands, Cal., in 1893 the first three-phase transmission plant for general service. He also installed at Taftville, Conn., the first polyphase transmission plant for cotton-mill drive and for electric railway operation. In 1894 he took charge of the General Electric power work in the Chicago territory, removing to Boston in the following year to establish his own office. From 1895 to 1905 he lectured on power transmission at the Massachusetts Institute of Technology.

### HIS DUAL FIELD

In addition to his work on the transmission of power, Dr. Bell early specialized in illumination problems, coordinating the study of electric lighting with that of optics. In each of these important fields—power transmission and illumination—he produced the earliest standard treatise published in America. His "Electric Power Transmission" (1897) stood as authority for years and was translated into French and German, and his "Art of Illumination" (1902) was the only available volume on illuminating engineering for a long time after its publication. Since 1914 he had lectured on public lighting at Harvard University and on illumination at Harvard Medical School.

Other books of which Dr. Bell was the author are: "The Electric Railway" (1892), with Oscar T. Crosby; "Power Transmission for Electric Railways"

DR. LOUIS BELL

(1896) and "The Telescope" (1922). He was a prolific contributor to the technical press. He supplied the article on "Illumination" in the "Standard Handbook for Electrical Engineers," that on "Power Houses" in the Encyclopædia Americana and those on "Electric Power Transmission" and "Electric Motors" in the tenth and eleventh editions of the Encyclopædia Britannica. His impartiality as between his two chosen subjects is shown by the titles of some of his contributions to societies and periodicals. These include "Absolute Wave Length of Light," *Philosophical Magazine* (1888); "Practical Properties of Polyphase Apparatus," *Transactions* A. I. E. E. (1894); "Physiological Basis of Illumination," *Proceedings* American Academy of Arts and Sciences (1907), and "Star Colors, a Study in Physiological Optics," *Astrophysical Journal* (1910). He had been a regular contributor to the ELECTRICAL WORLD for many years, both editorially and over his own name. His journalistic work, done under high pressure as most of it was, displayed, nevertheless, when at its best, not only his mastery in his chosen fields, but an ability seldom possessed by engineering specialists to impart a graphic touch to a technical subject without wandering from it, and even, without the loss of dignity, to bring a smile to his readers by an occasional humorous sally couched in the passing vernacular of the day.

### HIS MANY AFFILIATIONS

Dr. Bell took out forty patents relating to power transmission and optical apparatus. He was a past-president of the Illuminating Engineering Society, a member of the American Institute of Electrical Engineers, of which he was a manager in 1891-94; a member of the International Electrotechnical Commission and the International Illumination Commission, and a fellow of the American Academy of Arts and Sciences. He received from British illuminating engineers the compliment of being made a vice-president of the Illuminating Engineering Society of London. He was secretary of the power transmission section of the International Electrical Congress held at St. Louis in 1904 and for six years (1895-1900) was chairman of the incandescent-lamp committee of the National Electric Light Association. In 1908 he undertook a roving commission in Europe for the Edison Electric Illuminating Company of Boston, studying the developments in lighting in many cities.

Dr. Bell had a profound knowledge of spectroscopy, alternating-current phenomena, wireless telephony, illumination in all its phases, physiological optics, the physiological interpretation of albedo and oculars. In the world war he was a member of the advisory committee of the Council of National Defense and in collaboration with Norman Marshall of Waltham, Mass., invented a system of signaling by ultra-violet rays which enabled dots and dashes to be transmitted invisibly to the enemy but with accurate reception for several miles by forces provided with the proper apparatus. This important contribution to the art of war was delayed in reaching the front by causes beyond the control of the inventors, although it is understood that it was successfully tested in the zone of advance and would have found widespread use had hostilities continued. His versatility was further shown by his interest in the technique of ordnance. He was a past-president of the Massachusetts Rifle Association. He invented a rifle sight which was used in the late war. His last research work was done in connection with the Sperry searchlight in the detection of helium.

For more than twenty-seven years Dr. Bell had carried on a consulting engineering practice in Boston, leaving design and construction to others and devoting himself to giving the advice and professional opinions that his acquirements so well fitted him to render. He was married in 1893 to Sarah G. Hemenway of Somerville, Mass., who, with a son, survives him.

## Pacific Coast Men Meet

**Interesting Employees in the Association—Promoting Electric Trucks —Western Development**

THE seventh annual convention of the Pacific Coast Electrical Association opened on Tuesday of this week at the Fairmont Hotel, San Francisco, with a big electric truck demonstration. Following a parade in which 116 electric trucks participated, the five hundred convention delegates and the members of the San Francisco Development League gathered for lunch and to hear several short talks on electric trucks. One of the largest users of these trucks in San Francisco stated that the delivery costs of his firm had been reduced more than 50 per cent since the discarding of gasoline trucks.

The most important thing the association has accomplished in the past year, said President James B. Black, is the reviving of the interest of the employee or class B members. The convention this year was being held in a large city to afford many members of this class an opportunity to attend and do some real work themselves, something to make the association worth while to them. The association, President Black said, is endeavoring to work from the bottom up instead of from the top down. This policy has borne fruit in the intensive work done by the Commercial and Technical Sections.

WESTERN DEVELOPMENT CONFERENCE

A special effort was put forth this year to make the "Western development conference," which was held on Friday, a big success. The association felt that it could profit by calling in men from the outside to discuss problems of mutual interest. The program of the conference included addresses by Willis Booth, president of the International Chamber of Commerce and vice-president of the Guaranty Trust Company of New York, who was to speak on "The Importance of the Pacific Coast in World Affairs"; Paul Shoup, vice-president of the Southern Pacific Company, whose subject was to be "The Effect of Government in Business on the Progress of the Country," and D. H. Botchford, vice-president and general manager of the Columbia Steel Company, to whom was assigned "The Steel Industry as a Basic Industry in the Development of the West."

The convention program this year was a departure from the usual type in that a few short crisp papers were presented instead of the usual committee reports. These papers were on correlated subjects to those studied by the committees during the year, and the interest taken in them stamped the plan as a success.

## Electrical Exhibit to Go to Small California Towns

The California Co-operative Campaign decided on an enlarged program at its executive committee meeting on Monday of this week held just prior to the convention of the Pacific Coast Electrical Association at the Fairmont Hotel, San Francisco. A pullman car and baggage car are to be purchased. The pullman will be equipped as a complete electrical home and the baggage car will be fitted out to show the possibilities of the use of electricity on the farm. These cars will be taken to all the smaller towns and communities of the state where it is not practicable to establish a regular "electrical home." The baggage car will be patterned after the cars exhibited by the farm bureau of the agricultural department of the University of California, which exhibited such cars throughout the state as far back as 1912 with great success. The cars will be painted yellow and named "California No. 1" and "California No. 2." It is planned to turn them over to the N. E. L. A. or some other national organization to be used to spread the electrical message all over the country.

The Co-operative Campaign will put on an additional field man, who will work largely among the architects and builders in the San Joaquin and Sacramento valleys. Two other field men will be added, one to work in the Los Angeles and the other in the San Francisco territory. These men will work among the contractor-dealers and other electrical distributing agencies to spread the message of co-operation and to establish a closer relation between the campaign and these branches of the industry.

The first half of the campaign's program for ten electrical homes in the state during the year has been completed. Five more homes will be shown in various cities during the remainder of the year.

# No License to Alabama Power for Lock 17

**Federal Commission Defers Action Because of Protest from Congressmen—Decisions Are Made on Many Applications from California and Other States**

PROTESTS from Representatives Almon, Jeffers and Bankhead of Alabama have caused the Federal Power Commission to withhold action on the application of the Alabama Power Company for a license covering the development of 5,000 hp. at United States Lock and Dam No. 17 on the Black Warrior River. (See ELECTRICAL WORLD for May 5, page 1051, and May 26, page 1229.) The position of the Alabama Representatives is that the State Public Service Commission is considering the issuance of a certificate of convenience and necessity. It is known, however, that the Alabama Representatives mentioned are opposed to any plan whereby the Alabama Power Company will secure a foothold on the Warrior River. They hope that a competitor for the Alabama Power Company will eventually be found through the disposition of Muscle Shoals and the Gorgas and Sheffield steam plants, and they would hold open for that interest such power as can be developed on the Warrior.

THE HIGH DAM AT MERCED

The commission has authorized the issuance of a license to the Merced Irrigation District of California covering a power and irrigation project on the Merced River in that state. Before issuing the license, however, the commission will investigate the safety of the design proposed. The arch structure is somewhat higher than anything which has been attempted heretofore.

SNAKE RIVER TRANSMISSION LINES

In authorizing a license to the Idaho Power Company covering the thirty transmission lines which connect its power stations on the Snake River with their load points, the commission will regard this network of lines—which have an aggregate length of a thousand miles—as a major project. As a rule transmission lines are handled rather perfunctorily as a minor part of a project. The commission's decision will make it necessary for the power company to furnish much more complete information than otherwise would be the case. About 30 per cent of the transmission line mileage is on public lands.

KERN RIVER LICENSE WITHHELD

In connection with the application of the San Joaquin Light & Power Corporation for a license covering a construction project on the Kern River the commission decided to withhold action until complete information is available with regard to the status of lands within the project area.

INTERCOMPANY DISPUTE

There also is a controversy in progress between the San Joaquin corporation and the Southern California Edison Company with regard to the level of the pool above the San Joaquin corporation's diversion dam. The Southern California Edison Company has agreed to a level of 948 ft. above sea level, provided the San Joaquin company agrees to draw down this pool temporarily whenever requested to do so, to enable the Southern California Edison Company to make repairs to its plant. The San Joaquin interests are unwilling to make such an agreement.

LICENSES AND DECISIONS

A license has been authorized for the Southern California Edison Company covering its Borel plant on the Kern River. This license was adjudged necessary in a recent opinion of the Supreme Court of the United States.

Permission to relocate 10 miles of its main transmission line between the Sierra Mountains and Imperial Valley has been extended to the Southern Sierras Power Company, so as to make the line follow the public highway.

Permission also was granted the company to build a 3-mile branch from its Palm Spring transmission line.

The city of Los Angeles has been denied rights on the Kings River. This proposed development is in the area suggested for inclusion in the Roosevelt National Park. The commission has also rejected the application of the San Joaquin Light & Power Corporation for rights on Bubbs Creek and Roaring Fork.

The Burbank Irrigation District will be allowed to place a temporary dam in the Snake River subject to the conditions which the Chief of Engineers has prescribed.

A license has been authorized for a 250-hp. project on Elk Creek in Idaho County, Idaho. The power is to be used for mining purposes by the Unity Gold Mines Company.

A license has been authorized for the Michigan Hydro-Electric Power Company of Three Rivers, Mich. It covers a project on the St. Joseph in southern Michigan.

The commission has authorized a license for the Houston Power Company covering a development on the Choctawhatchee River near Newton, Ala. The company propeses to construct a 50-ft. dam and install machinery capable of generating 5,000 hp.

Permission has been granted the Alabama Interstate Power Company to transfer to the Alabama Power Company the license covering its Cherokee Bluffs development.

PRELIMINARY PERMITS

The commission has authorized the issuance of these preliminary permits:

The Yosemite Power Company, Groveland, Cal., two developments on the Tuolumne River. An application for a permit covering a lower site was denied since it might interfere with the Hetch Hetchy water rights.

The Susquehanna Power Company of New York, covering the proposed 360,000-hp. development on the Susquehanna at Conowingo, Md.

OTHER ACTIONS

The Marianna (Fla.) Light & Power Company has announced its intention to develop a power project in the Chipola River, near Marianna. The commission has accepted jurisdiction.

The commission has authorized the executive secretary to prepare a condensed classification of accounts to be used by licensees not furnishing public service. These include mining companies, manufacturers and other industrial licensees. It also has authorized the executive secretary to act on behalf of the commission in the amending of licenses to embody minor changes in plants.

## Preliminary Permit Granted for Flaming Gorge

Despite the delay in ratifying the Colorado River treaty, which has held up action by the Federal Power Commission on many projects, a preliminary permit has finally been granted to the Utah Power & Light Company by the commission for its Flaming Gorge power development on Green River. The company is starting a preliminary survey and making plans for the construction of a 60,000-hp. plant and dam. An expenditure of $10,000,000 and the employment of a thousand men for three years when the final license is granted are involved. The site is 5 miles south of the Wyoming line in Utah, about 125 miles east of Salt Lake City.

## Commission May Now Act on Colorado River Projects

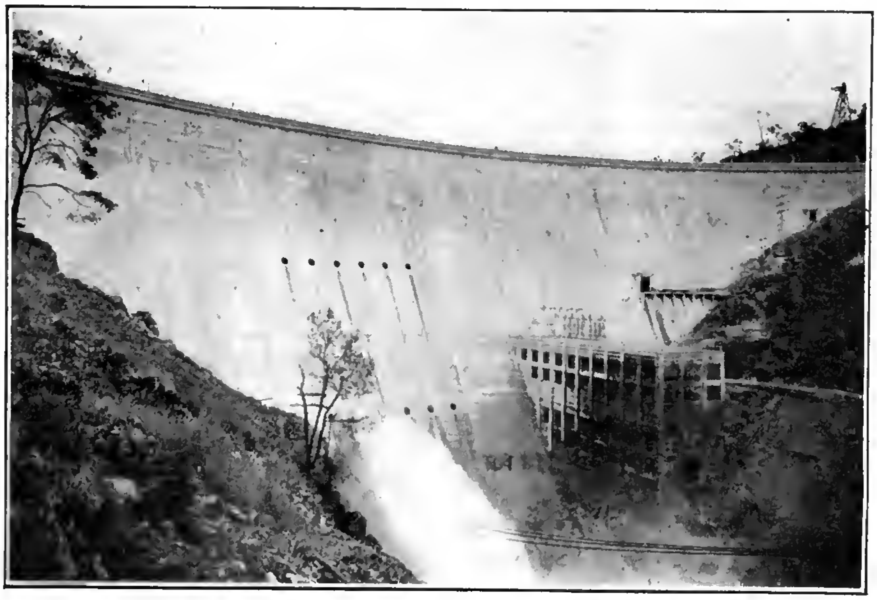
By granting a preliminary permit to the Utah Power & Light Company covering its Flaming Gorge project on Green River the Federal Power Commission has inserted the thin edge of the wedge which is expected to lead to action on the Colorado River projects. Regardless of what Arizona may do with regard to the ratification of the Colorado River compact, it is believed that the commission will this fall award the Girand license covering the large development proposed at Diamond Creek. It is believed that the upstream states could not insist successfully that the Arizona project be held up when they have urged the granting of the Flaming Gorge permit. Prominent officials of both Utah and Colorado are now on record as urging in very vigorous fashion the granting of that permit.

The load of the Utah Power & Light Company has been increasing at such a rate that a steam auxiliary must be put into operation in the near future. Unless the Flaming Gorge development is allowed to proceed as rapidly as possible, it will be necessary to construct additional steam units. It is to avoid this latter situation that so much pressure has been brought to permit the company to proceed with its foundation explorations at Flaming Gorge.

## Power and Irrigation

**Plant of Modesto-Turlock Irrigation District in California Distributes Energy as By-Product**

THE Don Pedro power plant of the Modesto-Turlock Irrigation District is the most recent hydro-electric plant to be placed in operation in California. This is a combination irrigation and power development costing $4,730,000, carried out primarily to increase water storage for irrigating 150,000 acres of land in the San Joaquin Valley. A power plant was built at the dam to utilize the head created and generate power from the water released for irrigation. The dam and power house are about 40 miles up the Tuolumne River from Modesto, Cal. The dam is of the concrete-arch type, 283 ft. high, creating a storage reservoir of 289,000 acre-ft. This storage will lengthen the irrigation season 40 per cent.



DAM AND POWER HOUSE AT DON PEDRO, CAL., ON THE TUOLUMNE RIVER

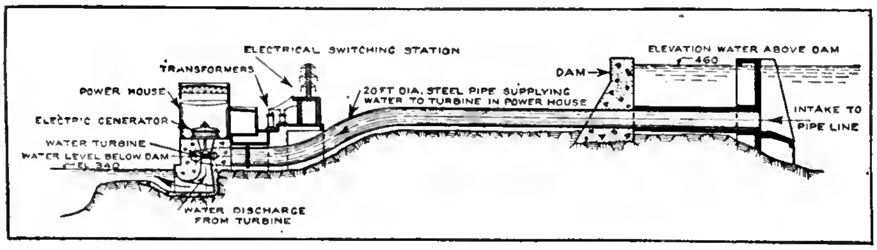
PRESENT CAPACITY 12,000 KW.

The power house, built on the downstream face of the dam, has a present equipment of three 4,000-kw. generators. The turbines are designed for variable-head operation. The efficiency is 91 per cent at 120 ft., the lowest head, and 83 per cent at 240 ft., the maximum head. The capacity at the low head is 62 per cent of full-load rating. Power is transmitted down into the valley over a 33-mile twin-circuit steel-pole transmission line at 66,000 volts. The Turlock district receives two-thirds of the power and the Modesto district one-third. Both districts are building distribution lines and will sell all power in excess of the requirements for pumping. The Turlock district already has many miles of distribution system and plans to build up a large range, water-heater and house-heating load. Rates for electric service are based on the "readiness-to-serve" theory.

## Ready to Start the Dam at Cherokee Bluffs

Following the approval of the Alabama Public Service Commission, Thomas W. Martin, president of the Alabama Power Company, has announced that the company will proceed at once to erect a power dam at Cherokee Bluffs on the Tallapoosa River, near Tallassee, Ala. The development will mean an expenditure of $10,000,000, and the dam, which will be 120 ft. high and 800 ft. long, will have an ultimate capacity of 132,000 hp. It will be the highest dam in the Southern States.

O. G. Thurlow, chief engineer of the Alabama Power Company and its subsidiary, the Dixie Construction Company, estimates that it will require more than two and one-half years to complete construction. Approximately 200,000 cu.yd. of concrete will be used in the dam and power house, and the largest body of water in the state will be formed when a reservoir of 22,500 acres, containing 25,000,000,000 cu.ft. of water, is backed up by the dam. Mr. Thurlow stated that the structure would be of a type popular in the Western States, but little used in the South. The power house will be built down stream from the dam instead of as an integral portion or on the upstream side, and the water will be conducted through penstocks leading from the dam above. Three units, generating 44,000 hp. each, are to be installed, and two of these will be placed in service as soon as possible.



CROSS-SECTION SHOWING PLAN OF CHEROKEE BLUFFS DAM AND POWER HOUSE

Much of the equipment used in building Mitchell Dam will be transported to Cherokee Bluffs, saving it from deterioration through idleness. The nucleus of the executive force which built Mitchell Dam has been retained and will be used in the new project. Cherokee Bluffs is in the center of a triangle formed by Montgomery, Alexander City and Dadeville, Ala.

## Hoover for Expansion of Electric Industry

"Further great application of electricity is one of the surest roads, not only to elimination of waste in industry, but to the stabilization of industry itself," Secretary Hoover said recently when interviewed at Washington. "Beyond this the enlarged scale of generation, distribution and reinforcement of reserve supplies of electrical power, spread over large areas, makes for continuity in industrial production such as cannot be secured in any other way.

"The growing interconnection of existing power systems and their reinforcement with larger centralized production units will serve further to assure the productive industries stability of their own power to a degree of importance that can be compared only to the relation of our Federal Reserve Bank system in stabilizing credit.

"Increased application of electrical power to replace innumerable small units of direct steam production not only becomes a great saving in labor, a general assurance of continuity of operation and a great reduction in the waste of material, but it also is a great contribution to the lightening of manual labor.

"One of the incidental problems of our industrial system is the inevitable growing shortage of common labor and the complete necessity that it shall be replaced with fewer units of skilled labor, performing the laborious task of the many. The more general spread of electrical power is inevitable for this reason, if for no other.

"The time is ripe for a general national program of superpower development. The stretch of economic transmission distances has brought power development from the mouth of our coal mines and from streams to within the economic reach of our industrial centers and our farms."

## Aims of New York Electrical Board of Trade

The board of governors of the Electrical Board of Trade of New York City at a meeting held June 20 accepted the following twenty tentative statements of the specific aims of its organization:

1. To represent the entire electrical industry of New York City in all matters of legislation, city departments, underwriters, etc., and to see to it that the interests of the electrical industry are safeguarded.
2. To co-ordinate generally all the activities of the various branches of the industry in order that no individual branch shall engage in any activities that would interfere with or demoralize any other branch of the industry.
3. To provide a method of co-operative and co-ordinated advertising with a view to accomplishing more far-reaching results and, at the same time, economize in expenditure.
4. To take up the problems of business and distribution of the individual branches of the industry through the board of governors, where all sides can be heard and where a proper disposition of the problems may be made.
5. To maintain a complete record of articles and of materials manufactured or dealt in, not only by members, but by all manufacturers and dealers, no matter where located.
6. To establish a bureau of employment so that any competent person from office boy to president may file an application for employment with the bureau, thus saving both employee and employer time and money in finding each other. The plan further contemplates that a reference from the board would be a thoroughly investigated reference and one that could be entirely relied upon.
7. To establish methods of carrying on the various types of business with a view to stabilizing conditions; i.e., attempting to see to it that methods of doing business are of such a type as to meet with the approval of the public at large, it being distinctly understood that this does not in any way mean the fixing of prices or the maintaining of any form of combination.
8. To maintain a complete and up-to-date mailing list subdivided according to types of business and territory with all the machinery for rapidly and economically distributing information, the idea being that, instead of each member being compelled to assemble and maintain an expensive mailing list, this work could be taken over by the board and the mailing out of materials be handled by the board for the members.
9. To establish a credit department for furnishing general credit information to the members, preferably the taking over of the present New York Electrical Credit Association and organizing it as a department of the board under the present credit manager, thus eliminating one set of expenses and expanding the work of this credit association to cover the membership of the board without additional expense.
10. To establish a bureau so that unknown inventors, who are now unable to market their inventions, may file description of the same with the board, and to appoint an experienced committee of the board, equipped with the knowledge of persons in the industry who might be interested in such inventions and would attempt to bring inventors and interested concerns together.
11. To establish a standing arbitration committee, consisting of the best judicial minds in the various lines of the industry, so that a controversy or disagreement between any members or between members and those not members could be quickly referred to three such arbitrators, thereby having differences settled by men skilled in the line in which the controversy arises, these men having a knowledge of every angle and ramification of the business.
12. To establish a bureau so that any member with a surplus of raw or finished materials could be brought in touch quickly with those in need of such materials.
13. Establishing an advisory committee of experienced and competent business men in the line to give business advice to such concerns as might apply for such advice, or even, possibly, citing a concern before such committee if, in the judgment of the board, it is necessary to do so for the benefit of the industry.
14. To remedy and improve the present bankruptcy methods and laws which now result almost invariably in a complete loss of property to the creditors with a gain only to certain types of attorneys; i.e., to establish machinery for economically and properly handling business failures in the industry.
15. To maintain a bureau for statistical information as to volume of business of various kinds in sight, conditions of the raw and finished material markets, etc.
16. To maintain a permanent exposition of interesting modern electrical devices and also, if possible, to maintain a museum covering the original models and early inventions so as to preserve such materials for the generations to follow.
17. To maintain a bureau of investigation of illegal businesses and particularly to follow up, expose and punish those lending themselves to the furthering of the sale of stolen materials and to so-called dishonest failures.
18. To make the Electrical Board of Trade the headquarters not only for New York men and members, but the New York headquarters for all in the electrical industry, no matter where located.
19. To establish a standing in the electrical business community for all firms holding membership in the Electrical Board of Trade and to bring about as rapidly as possible a condition where no firm or corporation can remain a member that does not conduct its business affairs and its relations with members or the public along lines of fair dealing and sane business and in a way to reflect creditably upon the industry.
20. Finally, to set up in the city of New York an institution, representative of the best talent and brains of the electrical industry, in both a technical and business way—an institution so representative of the electrical industry that citizens will recognize it as such and point to it with pride.

## Stave River Development

**By Means of Tunnel from Alouette Lake British Columbia Company Plans to Develop 115,000 Hp.**

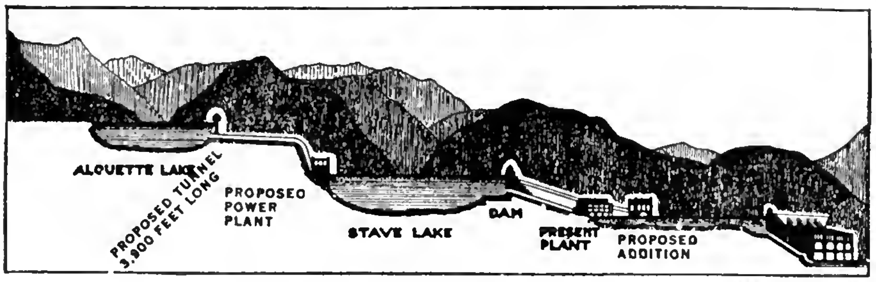
PLANS are announced by the British Columbia Electric Railway Company of Vancouver, which owns the Vancouver Power Company and the Western Power Company of Canada, supplying electric light and power to the city of Vancouver and other cities and towns in the Pacific province, for a power development of 115,000 hp. on the Stave River. This power is to be generated in three plants, the construction of which will be extended over a period of five to ten years. It is anticipated that the expenditure will be in the neighborhood of $10,000,000. The present Stave Falls plant was built by the Western Power Company and taken over by the British Columbia Electric Railway Company after its absorption of the former company in 1920. This plant has an installed capacity of 52,000 hp., the fourth unit, which brought the plant up to capacity, having been installed by the British Columbia Electric Railway Company in 1922. During the last year work has been going on raising the present dam and building a new dam at the Blind Slough, which will increase the water storage 50 per cent at a cost of $1,000,000.

Adjacent to Stave Lake lies Alouette Lake, distant about half a mile at its upper end. The water rights on Alouette Lake have been held by the Burrard Power Company, a subsidiary of the British Columbia Electric Railway Company. It was originally intended to develop power by means of a dam and flume, but with the acquisition of the Stave River watershed it is now proposed to tunnel between the two lakes, building a dam at the lower end of Alouette Lake and diverting the water by means of Stave Lake and River.

This diversion is at present the subject of an application before the provincial authorities, and if permission is given, a power house will be built at the mouth of the tunnel on Stave Lake. This plant will use a head of approximately 140 ft. and will generate 10,000 hp. Although plans are not definitely made, it will probably operate on a load factor of more than 80 per cent.

The second undertaking under the proposed scheme will be the addition of a fifth unit to the present Stave Falls plant, which will be made possible by the diversion of Alouette Lake water. Operating at a lower load factor than the Alouette Lake plant, 25,000 hp. will be developed.

Three miles below the present Stave Falls plant a third plant will be built, to be known as the lower development. At this site it is estimated that a plant of 80,000 hp. can be erected. The total flow from Stave Lake to tidewater will be made use of in the present power house and in the lower development. The upper plant now in operation utilizes a 150-ft. head and the lower plant will utilize the rest. Construction work on the Blind Slough dam is going on under the direction of R. S. Kelsch of Montreal, consulting engineer. E. E. Carpenter, formerly of the firm of Baker & Carpenter, San Francisco, has recently been appointed chief electrical engineer for the company, and he will have immediate superintendence of the proposed new work.



PLAN OF STAVE RIVER DEVELOPMENT

## How Municipal Plants Dwindle in Oklahoma

During the last year municipally owned electric light plants have had a thorough test in Oklahoma, and it is regarded as significant that ten of the plants in that state that were sold or abandoned were municipally owned. These towns decided to dispose of their city-owned plants and take energy from central-station companies.

Among the towns finding municipally owned plants unsatisfactory are Okemah, which has signed a contract with the Oklahoma Gas & Electric Company; Heavener, which sold its plant to the same company; Hunter, Billings, Watonga and Geary, which gave up municipal plants to take service from the Oklahoma company; Boswell and Soper, which signed a contract with the Public Service Company of Oklahoma; Ramona, which voted to abandon its municipal plant to receive service from the Sand Springs Power, Light & Water Company; Wapanucka, which sold its plant to the Public Service Company of Oklahoma, and Pawhuska, which was connected with the high-tension line of the Sand Springs company.

Norman and Lawton also abandoned their municipal electric lighting projects and are buying energy from the Oklahoma Gas & Electric Company. Eldorado a few weeks ago completed a high-tension line to the plant of the Quanah Light & Ice Company at Quanah, Tex., and Purcell is now negotiating for electricity over a line which is to be extended south from the town of Norman and through Noble to Purcell.

## Electrical Contractors Listen to Prominent Speakers

The Eastern division of the Association of Electragists International had its annual meeting in Pittsfield, Mass., June 14, when electrical contractors from the New England States, New York, New Jersey, Pennsylvania, Delaware and Maryland to the number of 150 gathered at the Maplewood Hotel.

Charles L. Edgar, president Edison Electric Illuminating Company of Boston, spoke on the selling of electrical service, saying that the lack of knowledge on the part of the ordinary central-station man as to the work of the contractor and the needs of his business is due to lack of association and contact. The central station, he said, should sell appliances on a price basis that will maintain an ample profit for other dealers. Great good could be done by developing the consulting function of the contractor.

Alice Carroll, a representative of the Society of Electrical Development, offered suggestions on providing good service after the sale is made. Charles L. Eidlitz, commissioner of electrical service for New York City, took as his subject "Back to Quality, Sane Costs and Fair Dealing." He explained the manner of regulating submission of bids, which is said to have met with favor with contractors and city officials, as based on exact understanding of the various items entering into a bid. The plan was interpreted at further length by Lawrence W. Davis, director of the association's department of development, whose address was on "Estimating and Selling the Job." Following these addresses the open and closed shop divisions held conferences.

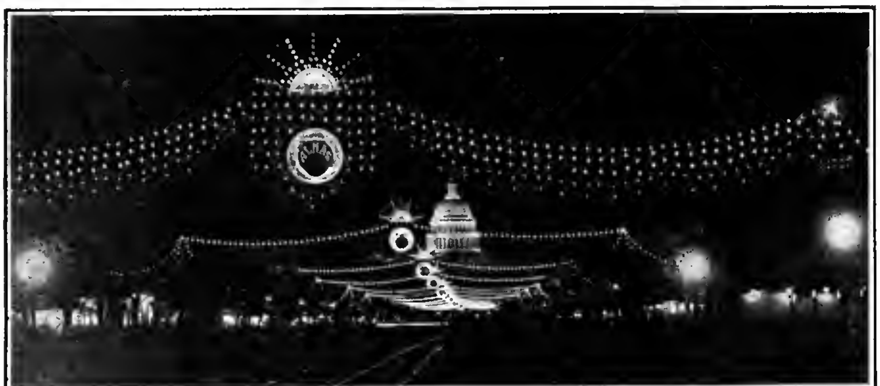
At the evening banquet President James R. Strong was the principal speaker. He urged fuller co-operation among the association members and also with other national organizations, like the plumbers' and steamfitters', whose work touches closely that of the electrical contractors.

## Fraud Charged in Expending Chicago Lighting Funds

George E. Carlson, Commissioner of Gas and Electricity for the city of Chicago, and five others have been indicted by a special grand jury, charged with criminal conspiracy to defraud the city in the expenditure of funds appropriated to the city lighting department. The charges, which are brought by the Citizens' Association of Chicago, allege depredations to the extent of $250,000, mostly caused, it is said, by having the city pay for material which was not delivered. It is further charged that the Commissioner has wasted about $200,000 of the $305,000 he has so far expended out of the proceeds of the two-million-dollar bond issue voted by the people in June, 1922, for the extension of the city's lighting system.

## Electricity at the Shriners' Convention

When the Knights of the Mystic Shrine gathered at Washington this month Pennsylvania Avenue from the Capitol to the Treasury Building, walled in on both sides by buildings bedecked with flags and festoons, presented at night a veritable ceiling a mile long of lights, red, green, yellow and white, divided at intervals by curtains of light extending below the main canopy. More than thirty-seven thousand lamps were used in the decorations, which cost $50,000. Pennsylvania Avenue was the "Road to Mecca," and Lafayette Square, the "Garden of Allah," was beautifully illuminated as a court of honor. The floodlighting of prominent buildings by means of powerful lamps and projectors also added greatly to the brilliant spectacle presented by the city as a whole. The plans were worked out by the Illumination Bureau of the Westinghouse Lamp Company.



©Westinghouse Lamp Company

## Engineers Discuss Standardization Plan

At the regular quarterly meeting of the main committee of the American Engineering Standards Committee, held June 15, at the Engineers' Club, New York, the chief matter of interest was a discussion of the new standardization project of the Department of Commerce. Dr. A. S. McAllister, who is to have charge of this work and who until recently has been on the staff of the American Engineering Standards Committtee as liaison officer of the Bureau of Standards, was present and outlined Secretary Hoover's plans.

The plans contemplate collecting information with regard to existing specifications for the purchasing of commodities and making this information and such specifications available to government departments and state and municipal authorities. In the opinion of the A. E. S. C. this work will have a stimulating effect upon the whole standardization movement and will result not only in a larger use of specifications but in a larger demand for the authoritative standards that are now being developed under the auspices of the federal specifications board and the committee.

# Brief News Notes

**Sioux City Extensions.**—Improvements totaling $3,000,000 are soon to be started by the Sioux City Gas & Electric Company. This includes the plans for a generating station to cost $2,500,000. The plant will contain two turbogenerators rated at 10,000 kw. each.

**Effort to Electrify Railroads in St. Louis.**—The Director of Public Safety of St. Louis is conferring with the traffic committee of the Chamber of Commerce upon an ordinance to compel the electrification of all railroads entering St. Louis. This action is to be taken to aid in abating smoke, and a law similar to that passed by the New York State Legislature to force electrification in Greater New York is favored.

**Rumored Mexican Development.**—Purchase has just been made of extensive water-power rights in the State of Vera Cruz, Mexico, near Orizaba, by Allen Rantell of London, England, and associates. It is asserted that this transaction is preliminary to the construction of one or more large hydro-electric plants which will furnish power for industrial concerns within a radius of more than a hundred miles.

**Public Service Corporation of Quebec to Become Quebec Power Company.**—Shareholders of the Public Service Corporation of Quebec, a subsidiary of the Shawinigan Water & Power Company, have ratified bylaws providing for changing the name to Quebec Power Company and increasing the capital from $3,000,000 to $10,000,000. This company is expected to absorb the Quebec Railway, Light, Heat & Power Company, which it now controls.

**"New York in 1923."**—An unusually attractive souvenir under this title was presented by the New York Edison Company to the delegates at the recent convention of the N. E. L. A. It was got up in very attractive form and contained many artistic photographs not only of familiar places in the city but the unfamiliar ones as well. The great majority of the pictures were taken by the company's own staff of photographers, though there were a few by Van der Weyde.

**New England Power Company to Furnish 12,000 Kw. to Steel Corporation Subsidiary.**—The American Steel & Wire Company, a subsidiary of the United States Steel Corporation, which has been purchasing part of its power during the last ten years, has recently signed a contract with the New England Power Company whereby it will purchase all of its power with the exception of that used in its steel rolling mills. This load is expected to average about 12,000 kw.

**Southern Minnesota Absorbs Spring Valley Utility.**—The Southern Minnesota Gas & Electric Company announces the purchase of the Northwest Utilities Company of Spring Valley, Minn. This adds twenty-two to the chain of towns now served by the Southern Minnesota company, making a total of about sixty-five communities in southern Minnesota and northern Iowa. The twenty-two towns will add four thousand customers to the company's list.

**Rice Lake, Wis., to Purchase Central-Station Plant.**—In accordance with a vote of its citizens registered three years ago, the city of Rice Lake, Wis., is at length about to issue bonds to take over the local electric light and power plant of the Wisconsin-Minnesota Light & Power Company. The property was appraised by the Railroad Commission in August, 1922, at $233,000 and, with subsequent improvements, is valued at approximately $250,000. The city owns much of the lighting equipment and also an auxiliary power generating olant operated by steam.

**Appalachian Water Power Conference.**—With at least one hundred New England cotton-mill owners invited to be present and the question of a survey of the French Broad River as one of the main topics, no little interest attaches to the second annual conference of the Appalachian Water Power Conference to be held in Asheville, N. C., June 25, 26 and 27. A federal appropriation of $200,000 is available for surveys in the Appalachians. The Asheville Chamber of Commerce is endeavoring to secure pledges that if the survey of the French Broad is made the recommendations will be carried out.

**Movement to Abolish Oklahoma Commission.**—A movement for the abolition of the Corporation Commission of Oklahoma was started when initiative petitions for this purpose were filed with the Secretary of State on June 1. The movement is backed by the Farmer-Labor-Reconstruction League and the farm-labor group, which is active in all the state departments. The proposed amendment would substitute for the Corporation Commission a commissioner of railroads and warehouses, who would be elected for four years with a salary of $5,000 a year.

**La Crosse Must Wait for Commission to Fix Rates.**—Efforts of the La Crosse (Wis.) municipal government to speed

up a change of the local electric light and power rates by injunction proceedings came to naught recently in the Wisconsin Supreme Court when that tribunal handed down a ruling that the city has no cause for action against the Wisconsin-Minnesota Light & Power Company pending a revision of rates by the Railroad Commission. When the court held the "loop" system of rates to be unlawful, the city set out to get a court ruling which would require the local company to use the rate in effect in October, 1920, before the "loop" rate was applied.

**Work Begun on Turner Shoals (N. C.) Project.**—The second water-power development recently announced by the Blue Ridge Power Company is now under way on Green River, in Polk County, N. C., where a large force of men is at work excavating for the dam, which will form a lake covering 400 acres and be slightly larger than the Lake Summit development at Tuxedo, several miles above on the same stream. The new development, which will be known as Turner Shoals, is on Green River just above where the highway from Tryon to Chimney Rock crosses the river. The company expects to develop 10,000 hp., and the project involves the expenditure of approximately $1,000,000.

**Westinghouse Units for Kearney Plant.**—The two turbine generators ordered by the Public Service Production Company from the Westinghouse Electric & Manufacturing Company for the mammoth new plant at Kearney, N. J., will be of the standard Westinghouse high-pressure condensing type, designed to deliver 40,000 kw. maximum with high-pressure steam at 325 lb. gage, 270 deg. superheat and 28.5 in. vacuum. They will be supplied with four bleeder openings each for the purpose of bleeding out steam to heat the condensate for boiler-feed water. The generators will be for 35,000 kw. at 80 per cent power factor and will be wound for three-phase, 60 cycles, 13,200 volts, to operate at 1,800 r.p.m.

**Plans for City Lighting in St. Louis.**—Fifty thousand dollars has been appropriated for making the plans for the city lighting system authorized by the St. Louis voters recently. The project involves establishment of approximately 50,000 electric lamps and the abolishment of 23,000 gas lamps. It is planned to place lamps experimentally at various points to determine by actual use which gives the most satisfactory light. One lamp under investigation will, it is claimed, illuminate the sidewalk without shining into the houses alongside. A special refracting lens is placed on the sidewalk side of these lamps which limits the area of illumination, while on the other side the light is thrown far over the street.

**Indiana Company Shows New Plant to Business Men.**—More than two hundred prominent business men of Indianapolis visited the new plant of the Central Indiana Power Company, on the Wabash River, 6½ miles from Terre Haute, last week as guests of the Merchants' Heat & Light Company, under the personal direction of Charles O'B. Murphy, vice-president and general manager. This plant was described in the ELECTRICAL WORLD for March 31, page 770.

**Insull Companies Take Interest in Social Welfare Work.**—A public utility chapter of the Illinois Children's Home and Aid Society with a potential membership of 25,000 among the employees of the Insull properties in Illinois is the latest move of interest in public welfare among utility organizations. A board of governors, with John F. Gilchrist of the Commonwealth Edison Company as chairman, Britton I. Budd as vice-chairman, L. C. Tovay as secretary and F. H. Scheel as treasurer, has been formed. The dues and other funds collected will all be turned over to the parent society, and the incidental office and clerical expense will be borne by the public utility organizations whose employees make up the chapter.

**To Put the River Bann to Work.**—Plans for utilizing the waters of the River Bann, flowing into Lough Neagh, in County Antrim, Ireland, 30 miles from the city of Belfast, have reached the stage at which many influential people are interested in their accomplishment, says Consul Kent, Belfast, in a report to the Department of Commerce. The purpose of this scheme is to generate electricity sufficient to supply all of the industries of that section. A bill was introduced into the British Parliament early this year for the chartering of a company and conferring upon it the necessary powers to proceed with this work. It is said that the people of County Antrim have just begun to realize that the River Bann possesses one of the finest hydro-electric power schemes in the whole United Kingdom and that enough power could be produced to light the whole of the six counties of northern Ireland and supply every mill and factory with power.

# Associations and Societies

**Chicago Section, A. I. and S. E.**—On June 27 the Chicago Section of the Association of Iron and Steel Electrical Engineers will hold an outing aboard a lake steamer sailing from Chicago to Michigan City and return.

**Worcester A. I. E. E. Section Elects Officers.**—The following officers have been elected by the Worcester (Mass.) Section of the A. I. E. E.: Chairman, Lewis E. Pierce; vice-chairman, Henry O. Tilton; secretary and treasurer, Stuart H. Anson.

**San Francisco Engineers' Club.**—Five hundred members of the San Francisco Engineers' Club, the San Francisco Electrical Development League and the Electric Club of Oakland were the guests of the San Francisco-Oakland Terminal Railways on May 28, when they were taken for a ride around the bay on the Hayward, the first turbo-electric ferryboat ever constructed, which is driven by two 1,200-hp. General Electric marine-type motors.

**I. E. S. to Convene at Lake George, N. Y.**—The 1923 convention of the Illuminating Engineering Society is to be held Sept. 24 to 28 inclusive at Lake George, N. Y. The headquarters of the convention will be the Fort William Henry Hotel. A well-balanced program of commercial and technical papers is being prepared by the committee on papers, under the direction of J. L. Stair of Chicago; a good program of entertainment will be provided, and unusual spectacular lighting features are planned.

**Northwest Electric Light and Power Association.**—The annual convention of the Northwest Electric Light and Power Association (geographic division N. E. L. A.) will be held in Seattle, Wash., June 27-30. The commercial and technical sessions will be held at the Washington Hotel in Seattle during the first two days of the convention, and on Friday morning the delegates will leave for Victoria, B. C., via Canadian Pacific steamship. The annual golf tournament will be held in Victoria on Friday afternoon, and following a banquet in the evening at the Empress Hotel the executive session will be held. At this session special reports will be presented and the election of officers will take place.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Southern Appalachian Water Power Conference—Asheville, N. C., June 25-27. J. A. Switzer, Knoxville, Tenn.

American Institute of Electrical Engineers—Annual convention, Swampscott, Mass., June 25-29; Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

American Society for Testing Materials—Atlantic City, June 25-29.

Iowa Section, N. E. L. A.—Mason City, June 26-29. M. A. Linn, Des Moines Electric Co., Des Moines.

Associated Manufacturers of Electrical Supplies—New London, Conn., June 26-29. Frederic Nicholas, 30 East 42d St., New York.

National Council Lighting Fixture Manufacturers—Buffalo, June 26-28. C. H. Hofrichter, 233 Gordon Square Bldg., Cleveland.

Northwest Electric Light and Power Association—Seattle, June 27-30. G. E. Quinan, 204 Electric Bldg., Seattle.

Ohio Electric Light Association—Cedar Point, July 10-13. D. L. Gaskill, Greenville.

New England Division, N. E. L. A.—Swampscott, Mass., Sept. 6-8. Miss O. A. Bursiel, 149 Tremont St., Boston.

Michigan Electric Light Association—Grand Rapids, Sept. 11-13. Herbert Silvester, Detroit Edison Co., Ann Arbor.

Rocky Mountain Division, N. E. L. A.—Glenwood Springs, Col., Sept. 17-19. O. A. Weller, 900 15th St., Denver.

Illuminating Engineering Society—Lake George, N. Y., Sept. 24-28. S. G. Hibben, 29 West 39th St., New York.

Association of Iron and Steel Electrical Engineers—Buffalo, Sept. 24-28. J. F. Kelly, 513 Empire Bldg., Pittsburgh.

American Electrochemical Society—Dayton, Ohio, Sept. 27-29. Colin G. Fink, Columbia University, New York.

# Recent Court Decisions

**Man Who Remains at Work in Dangerous Place After Seeing Companion Injured Cannot Recover Damages for Subsequent Hurt.** — In Straight vs. Western Light & Power Company, the Supreme Court of Colorado upheld the trial court in directing a verdict for the defendant. The evidence showed that Straight and another were working on a roof crossed by high-tension wires and that Straight's companion was slightly injured apparently by electricity leaking from these wires, which he did not touch. Subsequently the plaintiff was severely injured from the same cause. He testified that, although he had been originally warned not to go near the wires, on the day when he was injured the company's agent told him that they were "not leaking now" and it was safe to work under them. The court held that the injury to his companion constituted a warning that Straight, as a matter of law, was culpably negligent in disregarding. (214 Pac. 397.)*

**How Inadequate Income Injures Credit.**—In declaring confiscatory the rates prescribed by the Public Service Commission of West Virginia for the Bluefield Waterworks and Improvement Company (see issue of June 16, page 1429), the United States Supreme Court made these observations on the relation of income to credit and the injury caused by a rate of return too low to afford stability: "Investors take into account the result of past operations, especially in recent years, when determining the terms upon which they will invest in such an undertaking. Low, uncertain or irregular income makes for low prices for the securities of the utility and high rates of interest to be demanded by the investors. The fact that the company may not insist as a matter of constitutional right that past losses be made up by rates to be applied in the present and future tends to weaken credit, and the fact that the utility is protected against being compelled to serve for confiscatory rates tends to support it."

**"Present Fair Value" Not Synonymous with "Present Replacement Cost."**—In the case of the Georgia Railway & Power Company and the Atlanta Gas Light Company against the Public Service Commission of Georgia (see issue of June 16, page 1430), in which the gas rates set by the commission were attacked, there was a great difference between the valuation figures of the company and those of the commission's engineers, as well as a difference as to the rate of return which the proposed new rates would yield, the company asserting that it would be 3 per cent and the commission that it would be 6 per cent. The State Supreme Court dismissed the suit, partly on the ground that the return could not be determined until the lower rate was tried in practice. The majority opinion of the United States Supreme Court concurred in this view. (See also the Brush Electric Company case, issue of June 16, page 1435.) The court of last resort also approved the finding of the Georgia commission that "present fair value" is not synonymous with "present replacement cost," particularly under abnormal conditions. "The refusal of the commission and the lower court to hold that for rate-making purposes the physical properties of a utility must be valued at the replacement cost, less depreciation, was clearly correct," the majority opinion declared.

**Right of Commission to Institute Revaluation Proceedings Upheld.**—The right of the Alabama Public Service Commission to revalue the property of a public utility for rate-making purposes has been upheld in the Federal District Court in a case brought against the commission by the Mobile Gas Company. The court held, however, that the commission could not force the company to produce its books for a second examination. The decision has the effect of declaring constitutional the Brower bill passed by the last Legislature giving the utility board power to revalue a public utility when it deems fit. The opinion, reversing a previous dictum of the court, said that a contract between the state and the gas company did not result from the valuation of the company's property at its own expense.

**Indiana Commission Upheld in Permitting Competition in Indianapolis.**—An injunction against the action of the Indiana Public Service Commission in permitting the Terre Haute, Indianapolis & Eastern Traction Company to enter the competitive field in Indianapolis for supplying electric light and power has been refused by the Superior Court on the ground that there was no showing that the commission had acted beyond its jurisdiction, had acted with fraud, or that its order had violated any constitutional rights of the Indianapolis Light & Heat Company or the Merchants' Heat & Light Company. A salient point in the ruling was that "the public authorities are not prevented from granting a franchise to a subsequent and competing corporation merely because the effect of such subsequent franchise may be the creating of competition which will injure the business of the original corporation." The court said: "Even if there was no evidence of public necessity, yet if we are right, that no terms of any contract the plaintiffs hold have been violated, and if they are not being deprived of any property unlawfully, then, if the action of the commission was within its jurisdiction and no fraud was shown, the action of the commission is final."

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Considerations Governing Rural Extensions.**—Dismissing a petition from residents of North Gray who sought to compel the Cumberland County Power & Light Company to serve them, the Maine Public Utilities Commission declared that extensions of service should not be required in a section of a community so situated, by reason of its distance from the distribution line in sparsely settled territory or for any other reason, that service to it can be rendered only at additional or extraordinary cost, unless a guaranteed revenue approximating at least the cost of rendering said service can be had.

**Operation at a Loss.**—A public utility company cannot be compelled to operate at a loss where it is impossible to hold out the possibility of earning operating expenses, depreciation and a fair return upon its property serving the public. So holding, the Indiana Public Service Commission authorized the Winona Electric Light & Water Company to abandon heating service where the plant had been continuously operated at a loss, operating expenses could not be reduced, and where the company, if it was to continue to operate, must secure increased revenue. The likelihood of gaining additional consumers was very slight, and the heating rate was so high as to be practically prohibitive. The commission said that to increase the rate to a point that would permit the payment of operating expenses and a return would not be practicable as the present rate was so high that an attempt to increase it would probably result in a loss in customers and a decrease in revenue.

**Reasonableness of Desired Extension Must Be Determined.**—The public utility is not the only party to be affected by making expenditures in extensions, the Idaho Public Service Commission observed in a case concerning utility service in Cœur d'Alene. "The existing consumers," it continued, "must be considered in determining whether or not an extension should be made. Before an extension should be made there must be taken into consideration not only the necessity of the service but also the reasonableness of the demand. Even though there exists a necessity for the service the extension should not be made unless the demand is reasonable. Otherwise such extensions would result in increasing the rates upon the existing consumers. Extensions should not be made by a public utility where the immediate and prospective revenues to be received from such extensions are out of proportion to the cost of making the extensions. The expenditures for extensions must be guarded in order to protect the existing consumers against exorbitant rates."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## F. M. Feiker Joins Society for Electrical Development

F. M. Feiker, formerly vice-president of the McGraw-Hill Company, Inc., and more recently on leave of absence as special agent of the Department of Commerce at Washington will after his return from Washington, be associated with the staff of the Society for Electrical Development, New York City. As a result of the appointment of Mr. Feiker the various branches of the electrical industry served by the society will secure the benefit of his broad experience and background, for he will be available to act as a special counselor to engineers, manufacturers, central stations, jobbers, contractor-dealers and publishers. His special training and wide knowledge in the engineering publishing and public relations field of many industries, qualify him eminently for such consulting work. Mr. Feiker will retain a consulting relation to the McGraw-Hill Company, and he will continue in a similar capacity his relation to the problems of personnel and organization of the Department of Commerce at Washington.

©Underwood & Underwood

F. M. Feiker

**Alfred S. Nichols**, who has been with the Stone & Webster organization for thirteen years and for the past six years has been manager for it of the light, power, street-car and gas company at Paducah, Ky., has been appointed manager of a new company organized to carry on the electric light, power and street-railway business in Kingston, Jamaica, British West Indies. Montreal banking interests organized the company, and Stone & Webster, Inc., of Boston have been appointed general managers. Mr. Nichols is of English birth and has had a wide business experience in British mercantile work and, during the past twenty years, in the United States in newspaper work and in the operation of public utilities.

**Clive C. Bell** has resigned his position as city salesman for the Wisconsin Valley Electric Company, Wausau, Wis., to become sales manager for the Ironwood (Mich.) branch of the Lake Superior District Power Company.

**John C. Karcher**, who was associated with the Bureau of Standards, Washington, D. C., until last February, has entered the service of the Western Electric Company as research engineer at the Hawthorne plant, Chicago.

**Samuel B. Flagg** has become associated with the Sanford Riley Stoker Company of Worcester, Mass., as special representative at New York City. Mr. Flagg was engaged for several years in fuel studies with the United States Bureau of Mines, and for the past six years has been associated with the Electric Bond & Share Company as fuel expert.

**Frank B. Faris**, formerly attorney-examiner for the Public Service Commission of Indiana and recently associated with the law firm of Haynes & Mote, Indianapolis, has entered the general practice of law in that city under his own name, devoting himself particularly to rate, securities, valuation, tax and other matters affecting public utilities before regulatory boards, commissions and the courts.

**Dr. W. R. Whitney**, director of the research laboratory of the General Electric Company, was recently elected a member of the corporation of the Massachusetts Institute of Technology for a term of five years. He was graduated from the institute in 1890 and has for some time been a non-resident professor of theoretical chemistry there. Walter Humphreys of Brookline and Charles R. Maine, consulting engineer of Boston, were also elected. These three succeed P. W. Litchfield, A. D. Little and E. S. Stevens.

**L. C. Bewsey**, superintendent of the Michigan United Railways, Kalamazoo, Mich., has severed his connection with the company to become general manager for the holdings in Cuba of the Electric Bond & Share Company of New York, with headquarters at Santa Clara. Previous to his association at Kalamazoo Mr. Bewsey spent four years in the Philippine Islands as superintendent of transport and motive powers for the Manila Electric Company and as electrical engineer in charge of estimates, designs and construction for the Pacific Commercial Company of Manila.

## A. H. Timmerman Electric Power Club's New President

Arthur Henry Timmerman, vice-president and chief engineer of the Wagner Electric Manufacturing Company of St. Louis, was elected president of the Electric Power Club at its meeting in Hot Springs, Va., last week. Mr. Timmerman has been associated with the Wagner company since 1899, when he left the School of Mines and Metallurgy of the University of Missouri, where he was professor of physics and electrical engineering, to enter the industrial field as an engineer. In 1908 he was advanced to the position of chief engineer, and in November, 1919, he was made vice-president and chief engineer, the office he occupies at the present time. Mr. Timmerman was born in New York City in 1871. He was graduated from the College of the City of New York in 1891 and later received the degrees of M.E. and M.M.E. from Cornell University. He spent one year as instructor in physics at Washington University, St. Louis, and for five years previous to his association with the Wagner company he was at the University of Missouri. Mr. Timmerman is a fellow of the American Institute of Electrical Engineers and a member of the National Electric Light Association and of the Society of Automotive Engineers.

A. H. Timmerman

**J. W. Denison**, formerly purchasing agent of the Southern Wisconsin Electric Company at Lake Geneva, Wis., has been made assistant treasurer of the Michigan Gas & Electric Company, with headquarters at Three Rivers, Mich.

**Horace H. Dodd**, manager of the Lawton & Duncan Electric Company, Lawton, Okla., has tendered his resignation and will be succeeded by J. S. Boyett. The Lawton & Duncan Electric Company is successor to the Comanche Light & Power Company, the Duncan Electric & Ice Company and the Temple Electric Company, and Mr. Dodd has been identified with these properties for the last fifteen years.

## Breaking Into the Electrical Industry

### Obstacles Encountered by the New Manufacturer a Brake on Progress and a Menace to the Industry

By a Small Manufacturer

THERE is a situation in the electrical industry which I believe should be discussed. Unless it is corrected, it will deprive the industry of the inventive genius and vision of many of our young men by making that part of the industry devoted to the manufacture and sale of wiring supplies an unattractive field to enter.

There is nothing that appeals more strongly to the interest and imagination of the best type of American youth than the mystery and constantly new developments and applications of electricity. As a result, our engineering schools are filled with students who are taking courses in electrical engineering, hoping that with their enthusiasm and vision, backed by their willingness to work hard, they may be able to attain success in their chosen profession. These young men in their home training and in their competitive athletics have developed a high sense of honor and square dealing, and never for an instant imagine that in their chosen electrical field they will meet with other than the square deal, with success the reward to the best man. With the present conditions in the industry they are bound to meet with disappointments which will destroy their faith and ideals.

#### An Opposing Barrier

In order to view the situation clearly, let us assume that some of these young men start to manufacture a line of wiring supplies, first having closely studied the uses to which the various devices are put, and also having studied their competitors' products, so that in their product they may incorporate as many improvements as possible both from an engineering and a quality standpoint. And let us assume that they have turned out a high-grade product that could be sold in fair competition.

They call on all the principal jobbers of electrical supplies and receive a rather cool reception and no orders. Many of the men interviewed remark on the superior quality and cleverness of the designs, but they all frankly state that under no circumstances would they handle any of the product. Some kindly soul then tells them that they are "up against a hopeless proposition," as all of the jobbers on whom they have called are "old line" jobbers, and in the wiring supply field these jobbers rarely handle anything but the products of a small group of large "old-line" manufacturers. And so our young friends will soon discover that it is exceedingly difficult to market their products through the leading jobbers.

#### Using the Patent Feature

It would seem at once that such a relationship between manufacturers and jobbers clearly is in restraint of trade, and it may be wondered how it comes to be permitted, but the answer is soon found. There is some slight detail of the product of this "old-line" group of manufacturers that is covered by a patent. The detail may be trivial or even a disadvantage as compared with some other construction, but it is patented and therein lies its value. If one of the manufacturers in this group has some patented feature with his product that can be made a talking point, although practically of no value, all of the manufacturers in the group embody this feature in their device, and by advertising and sales work endeavor to create the impression that this feature is essential to a device of the kind. The United States government, in granting a patent, grants the recipient of the patent a monopoly for seventeen years on that particular construction. It is therefore clear why these manufacturers attach such importance to some apparently unimportant patented feature.

With the principal outlets for their products shut off from them, our young friends now are forced to seek other channels through which to move their products, and they find that there are a number of smaller dealers and small jobbers who are selling a great deal of material, but at very low prices. While a manufacturer must quote about 10 per cent below the prices of the "old-line" manufacturer in order to obtain the business, still, as the overhead expense of a small manufacturer is very much less than that of a large company, this difference in selling price is under normal conditions not a serious handicap. Therefore, as the young manufacturers have a good product and have made strong connections with the smaller jobbers, they begin to make some headway, but not for long, as the "old-line" manufacturers and jobbers are watching them closely, and as soon as they see that any manufacturer of wiring supplies is getting a foothold they open a barrage of cut prices which they expect will forever quiet the ambitions of any competing manufacturers. The price cutting is confined solely to the products made by the manufacturers under attack, while on other wiring lines prices are kept high to cover losses from cut prices.

#### Obstructive Distribution

If some one manufacturer was to make such sweeping cuts in selling pri es, it would be an indication of gross incompetence, but when a group of manufacturers send out at the same time the identical cut prices, confined to certain articles, it would seem clear that they are acting on a definite plan to eliminate competition. They feel that no manufacturer can exist whose products are confined to those on which they have cut the prices, and the

cut is no doubt made to accomplish that purpose.

To make these cut prices effective the "old-line" manufacturers have to count on the old-line jobbers handing the cut on to the trade, but a jobber realizes that cutting the selling prices in half may have a serious effect on his profits and so does not always want to help out in the plans. It, therefore, has become necessary for the manufacturers to have their own selling force right out on the firing line so that the cut prices can be handed directly to the wiring contractor, and to accomplish this they buy up electrical supply houses in different parts of the country so that the field shall be fully covered.

If our young friends had entered the radio manufacturing field or some other field than wiring supplies, their situation would have been quite different. Here they would have found the same "old-line" jobbers very keen to consider any proposition of merit, as they would not be acting under the restraint that governs them in the wiring supply field. Entirely new manufacturers of radio and other electrical parts have built up large businesses through these same jobbers, which indicates the possibilities of the industry when all restraint is removed from it.

### ARE SMALL MANUFACTURERS NEEDED?

It may be argued that the industry does not need the small manufacturer and that there is no room for him, because the large "old-line" manufacturers can supply all of the needs of the industry; but is this a fact?

Practically all of the improvements in wiring supplies have come from some upstart manufacturer and then have been copied by the "old-line" manufacturers, who by their grip on the industry have secured the profits that should have gone to the men responsible for them and which would have gone to them had it not been for the methods above described.

Another plan frequently used by such manufacturers in their efforts to kill competition is to threaten the smaller men with a suit for infringement of some patent. There may be no real basis for a suit—absolutely no infringement—but attempts are made to bluff some manufacturer into giving up a line that he manufactures rather than face the expense of litigation; for the large company knows that it can frequently wreck a small company by litigation more easily than by any other method, owing to the expense of defending the suit. In other cases dealers are warned by salesmen against buying the product of the new manufacturer and are told they may be liable to a suit for infringement if they do so. This has been tried in a number of cities at the same time, showing it to be part of a definite plan.

Such methods cannot stand the light of publicity, and the quicker they and others like them are exposed the sooner will the electrical industry become what it rightly deserves to be—that is, one offering to the bright American youth wonderful opportunities, with equal right to all and with the reward to the one justly earning success by his contributions to the industry.

# One Profit for the Jobber

**A Policy of Wholesale Business Only Is that Toward Which the Jobbing Industry Must Work as Its Service Grows More Intensive**

BY E. C. WEHLE
President Southern New York Electrical Supply Corporation, Binghamton, N. Y.

THE jobber of the future will have to be contented with one profit. As every man who is studying the trend of the electrical industry knows, the jobber's business is becoming steadily more localized. Contractors are buying more habitually from their nearest sources of supply, and the warehouse and service function of the jobber is becoming of steadily growing importance. The trend seems to be away from the day when the jobber traveled and sold on a wide territory in active competition with a large number of other jobbers and toward a more intensive service in a smaller district which can be served quickly, easily and economically from the warehouse.

Moreover, the customers of the jobber are becoming more and more opposed to competition from those from whom they buy. Put yourself in their place. Would you care to buy your material from a manufacturer who competed with you every workday in the week? Of course, this does not affect the contractor 50 miles from your place of business, but at the same time it is a good argument as it affects the electrical jobber who sells at wholesale only.

I absolutely know that the jobber who is now in the contracting and retail business will increase his wholesale end if he will stop trying to make double profit. Perhaps his earnings will not be so large the first few years, but they will ultimately gain by such a policy. I have heard of jobbers who have a contracting department threatening to put out of business a contractor who did not buy from them. I have seen jobbers establishing retail stores in small towns and cities trying to put the contractors out of business because of some grievance. But such a policy loses friends and customers and kills any business.

I believe that a jobbing house doing a "wholesale-only" business can render better service to its customers because it can devote all its time and energy to that end. The game today for the electrical jobber is to keep down his overhead and not build or rent a building for display purposes; rather, to consider location, yearly rental or investment in building, method of receiving and shipping of material, to give good service and not be too lenient with credits.

I have watched the jobbing business develop for many years. My first experience was at the age of fourteen years. I made a deal with a local locksmith who had a retail store on one of the main streets in Rochester, N. Y. We put in a fifty-dollar stock of electric bells, batteries, etc. I borrowed my $25 from my father. Nichols took the orders for repairing and installing doorbells and I did the work after school hours. We then split the profit at the end of the week. I made $180 the first year. I then decided I would make the electrical business my lifework. After I finished school in Rochester I got enough money to go to an electrical school in Washington.

When I returned from Washington I obtained a position with a Buffalo jobber as road salesman, and for the past sixteen years I have been in the jobbing end of the electrical business and have learned to love my work.

In the twelve years I was on the road I had an increase of business every year with the exception of three. I have always tried to increase my business over the previous year.

I am now president of this company. We have a location in the wholesale section, just off the main street in Binghamton. We pay less rent than any other jobber in the section. Goods received from manufacturers are put in a chute on the front of building and sent on the way to our stockroom. Like most jobbers, we have all the labor-saving devices that are necessary to make prompt delivery at a minimum cost.

Our business is growing very rapidly and I consider our success due to our policy of doing business. We sell at wholesale only, and the interest of our customers is therefore our most important consideration. We are not in competition with them at any point and are free to put our whole mind to serving them and developing the greatest possible amount of business for the territory we cover.

## Bearing of Linseed-Oil Decision on Open-Price Plan

By Franz Neilson
Counsel Association of Electragists International

ON THE fourth of June the United States Supreme Court handed down a decision declaring illegal the operations of the linseed-oil producers in conjunction with the Armstrong Bureau of Related Industries of Chicago. The question has been asked whether it is true that this decision means that all open-price associations must discontinue.

The answer is that it means no such thing. A number of people are as much mistaken in this conclusion concerning the effect of that decision as they were in others in the past, notably the Hardwood case and the Gypsum case.

The linseed-oil plan is no more representative of the things that can be legally done in open-price associations than the Hardwood and the Gypsum plans were.

The linseed-oil arrangement was not an open-price bureau at all. Stripping its written plan of the excess verbiage, there remains an agreement (a) to file price lists and (b) not to cut such filed prices without at once notifying the bureau. Add to this the intense activity of the bureau in pursuing cases where a cut in price was made—instanced by getting members "on the carpet" when such cuts were made—and we have a combination about as unlawful as in the Hardwood case. Filing a price list and agreeing to telegraph if that price should be cut amounts to fixing future prices.

We cannot say that this decision has any bearing on the plain, legally operated open-price exchange—except the psychological one of scaring people who do not understand.

It is plain that the linseed-oil scheme did not fall within the lines of the thumbnail chart previously issued regarding safe conduct under an open-price plan. That chart is as follows:

The members may exchange facts, including past prices and other statistics, and meet in pursuance thereof; but there must not be any agreement, express or implied, or concert of action respecting the things prohibited, which are chiefly prices to be charged, apportionment of territory, allocation of customers, limitation of production, discipline of competitors, etc.

Each member by himself and uninfluenced by the others must arrive at his own conclusions from the facts he has received and decide for himself what he will do, and this without communicating his decision by word or sign to the others.

Argument from business men, as distinguished from lawyers, in favor of statistical activities by trade associations is found in the report of the committee on trade associations of the United States Chamber of Commerce, appearing in the chamber's "Referendum No. 41," published Feb. 26 last.

Excerpts therefrom are:

"That the courts and investigations made by the Secretary of Commerce have disclosed a small minority of associations which may have misused statistics in carrying out a scheme to restrain trade we believe in no way invalidates or discredits legitimate collection and distribution of trade statistics by associations. On the contrary, your committee is confident that proper statistical activities on the part of trade associations not only do not run in contravention of laws respecting restraints of trade, but actively encourage and develop trade. . . .

"Summarizing the preceding discussion, the committee believes that trustworthy information concerning capacity, production, stocks, sales and prices is essential to the effective operation of industry and trade under competitive conditions. The voluntary reporting of such information to trade associations and the subsequent publication or dissemination of such information in a manner which makes it available not only to contributors but also to consumers and to the public generally is beneficial alike to the field of business and the public and does not constitute a restraint of trade."

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

RENEWED activity in trade was reported last week by electrical supply jobbers. Manufacturers are busy in electrical lines and transportation conditions are much improved. Production by central stations is gaining by leaps and bounds. Stocks in distributors' hands are now well rounded, the only shortage reported being in some of the larger sizes of rigid conduit.

Prices weakened slightly last week in rubber-covered and weatherproof wire, with some readjustments in flexible armored conductor. Seasonable weather long delayed is moving fans, but the outlook is not attractive in the coastal sections for a record business in fans this year. Washing machines are selling well, but the demand has slackened somewhat within the past four weeks.

Electrical presents are increasing in popularity for the June bride, and there is a good demand for automobile accessories of electrical character. Motor sales are in excellent volume, but competition is very sharp. Barring weakness in cotton-textile production and excessive labor costs in the building industry, with continued uncertainty as to the outcome of wage demands in the telephone field, Eastern business is in excellent condition. The demand for paper for use in cable manufacture is unusually heavy.

### Permanent Palace for Electrical Industry at Leipsic Fair

FOR some centuries an annual fair has been held in Leipsic, Germany, to which sellers have brought their wares and buyers have come to view them and to purchase. With the development of regular commercial channels and relations, it became usual to bring only samples to this fair, and orders were taken for future deliveries.

Electrical manufacturers have exhibited their apparatus and materials at this fair wherever they could find place, with all the accompanying inconveniences. Press dispatches now tell of the completion of a "Haus der Elektrotechnik," or a home of electrical industries, in which each exhibitor can have the same space year after year,

with permanent wiring, and merely change his exhibits if he so desires.

The exhibitors are divided into ten groups: (1) Large companies with several lines of manufacture; (2) motors, generators and transformers, with starters, regulators, etc.; (3) measuring instruments and meters; (4) communication field and devices using small currents; (5) switchboard equipment and wiring supplies; (6) porcelain products; (7) cables, wires and conduit; (8) raw materials; (9) heating, cooking and medical devices; (10) the illumination field. The building is provided with an auditorium for conventions or for special exhibitions. The electrical interests are said to be the first group of industries to provide a separate building for its exhibits at the fair.

## San Francisco Business Reported on Increase

WIRING crews are very busy, but estimators and outside solicitors for construction work report slower conditions. Store business is better, but the larger socket appliances, such as washers, are in their usual seasonal slump. Pole-line hardware prices have increased about 5 per cent, but other lines remain firm. Steamer rates to the Coast will advance July 30 and so, if for no other reason, further advances in all bulky lines may be expected. The steamer rate increase may be as high as 40 to 50 per cent. Probably half of present shipments are reaching the coast via steamer. Range sales are holding up well in sight of the 1,500 total for 1923 estimated by one of the power companies. Pole line material of all kinds is moving very briskly. Street-lighting material is expected to move very well, $2,000,000 for California being an expert estimate of sales within the next year.

## Chicago Jobbers Report Another Quiet Week

ELECTRICAL jobbers report another quiet week of trade. While a greater amount of contracts for various commodities and work of divers kinds have been figured on this week, the actual orders received have not been up to last week's mark. Pole-line hardware demand, however, has been very good. High-tension equipment demands still remain steady owing to central-station buying, which has been quite active. Certain types of motors of one manufacturer have increased 10 per cent. This increase covers types not increased previously. Conduit stocks have been replenished to a certain extent and firm prices are again being quoted by some manufacturers.

Transformer demand has been the same as previously, with no exceptional demands for this class of material at this time. Prices are firm and deliveries are not being made inside of six to eight weeks. Schedule-material prices are firm and stocks normal. Building permits for this week amount to $5,712,000, as against $5,019,000 last year. Labor unions are still arbitrating wage increases and the closed-shop conditions, which have had a tendency to retard building in this section.

## Delinquent Electrical Accounts in May Showed Improvement

AN IMPROVEMENT in the number of delinquents in electrical accounts for May, 1923, over April, 1923, is shown by the report of the National Electric Credit Association. All territories except New York show a lowered average value for this period. In the Chicago territory the total amount for April, 1923, was $111,130, while in May, 1923, it was lowered to $95,984. However, comparing May with May, 1922, the average amounts were $128 and $113 respectively.

DELINQUENT ACCOUNTS IN MAY

| Branch and Month | Number of Delinquent Accounts Reported | Total Amount | Average Amount |
|---|---|---|---|
| Central Division: | | | |
| April, 1922.... | 799 | $87,991.88 | $110.13 |
| April, 1923.... | 794 | 111,130.28 | 139.96 |
| May, 1922.... | 746 | 84,048.53 | 112.66 |
| May, 1923.... | 749 | 95,984.35 | 128.15 |
| New York: | | | |
| April, 1922.... | 460 | 56,616.00 | 123.00 |
| April, 1923.... | 422 | 63,771.00 | 151.00 |
| May, 1922.... | 440 | 58,401.00 | 133.00 |
| May, 1923.... | 437 | 68,228.00 | 156.00 |
| Philadelphia: | | | |
| April, 1922.... | 232 | 34,454.70 | 148.51 |
| April, 1923.... | 241 | 35,099 19 | 145.80 |
| May, 1922.... | 236 | 22,175.99 | 93.97 |
| May, 1923.... | 225 | 26,399.32 | 117.33 |
| New England: | | | |
| April, 1922.... | 68 | 7,128.00 | 104.82 |
| April, 1923.... | 44 | 7,979.04 | 181.34 |
| May, 1922.... | 108 | 7,908.93 | 63.97 |
| May, 1923.... | 29 | 3,464.08 | 119.45 |
| Pacific Coast: | | | |
| April, 1922.... | 25 | 3,594.67 | 143.50 |
| April, 1923.... | 39 | 8,444.75 | 216.53 |
| May, 1922.... | 24 | 2,133.82 | 88.99 |
| May, 1923.... | 20 | 2,910.69 | 145.70 |

The May, 1923, New York account, as compared with April, 1923, shows an increased average amount of $5. The number of delinquent accounts was 437 and 422 for May and April, 1923. The Philadelphia section for April and May, 1923, had lowered its accounts from $146 to $117, also reducing the number of accounts by sixteen.

The accounts in the New England territory for May, 1923, totaled $3,464, as against $7,979 for April, 1923. The total number of accounts for the same periods was twenty-nine and forty-four. On the Pacific Coast the accounts for May and April of this year were $146 and $217. The total number of accounts was lowered by nineteen.

A complete list of the accounts is reproduced above.

## General Buying Trend Is Still Cautious

MOST of the tests by which business trends are measured show a diminution of buying in primary channels, but a gain in retail distribution, according to Dun's review of trade. These are seasonal phases and do not mark any unusual or unexpected change in the general situation. Close observers of conditions had not anticipated that the noteworthy industrial expansion of the first quarter of this year would continue indefinitely, or that the rise of prices would go on unchecked, and the recent slowing-down process, with reaction in prices, has not been surprising.

The chief interest now centers on the probable course of events after the passing of the summer, and there is a disposition in many quarters to await a clearer insight into the future. This attitude is reflected by the increased conservatism in the placing of advance orders, as well as by the policy of avoiding burdensome accumulations of merchandise. While goods previously contracted for are being taken readily in most cases, isolated instances of cancellations still appear.

## The Metal Market

THE metal markets continue comparatively inactive, though sales of copper have improved. Consumers are not buying for forward delivery to the extent they were a few months ago, as their bookings have declined somewhat owing to the fall in metal prices. Improved export demand for copper has continued and prices are up.

Most producers feel the price should be fairly stable at between 15 and 16 cents. Lead has been remarkably quiet, and the windup of the Pittman act purchases of silver will have a further effe t in lessening production. In Chicago n ost sales have been at 7 cents. Zinc is quiet with less buying by galvanizers due to the price. Consumers are buying tin cautiously with forward deliveries sold ¼ cent less than spot.

NEW YORK METAL MARKET PRICES

| | June 14, 1923 Cents per Pound | June 21, 1923 Cents per Pound |
|---|---|---|
| Copper, Electrolytic. | 15.00 | 15.25 |
| Lead, Am.S.& R.price | 7.25 | 7.25 |
| Antimony.......... | 7.75 | 7.50 |
| Nickel, ingot........ | 27.00 to 32.00 | 27.00 to 32.00 |
| Zinc, spot........... | 6.37 | 6.37 |
| Tin, Straits......... | 41.90 | 41.90 |
| Aluminum, 98 to 99 per cent.......... | 26.00 | 26.00 |

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb.......................... | $0.34 | $0.034 | $0.0252 |
| Cold finished shafting, per lb.................... | 0.042 | 0.042 | 0.0328 |
| Brass rods, per lb............................ | 0.1850 | 0.1913 | 0.1533 |
| Solder (half and half), per lb.................... | 0.2862 | 0.2812 | 0.22 |
| Cotton waste, per lb.......................... | 0.1231 | 0.1231 | 0.104 |
| Washers, cast iron (½-in.), per 100 lb............ | 4.66 | 4.66 | 4.00 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100.................................. | 3.08 | 2.96 | 3.11 |
| Machine oil, per gal.......................... | 0.349 | 0.349 | 0.383 |
| Belting, leather, medium, off list............... | 42½% | 42½% | 46½% |
| Machine bolts, up to 1-in. x 30-in., off list........ | 44½% | 44½% | 62½% |

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Rescind Order to Close Lamp Works at Warren, Ohio

Officials of the National Lamp Works of the General Electric Company, Cleveland, at a meeting in New York, have rescinded the decision, previously announced, to close the works at Warren, Ohio.

According to A. M. Sweeney, manager at the plant, they will be continued in operation for an indefinite period, and the plan to concentrate production at the Cleveland works will temporarily be abandoned. The Trumbull (Ohio) plant of the company has been idle for for more than three months and has been placed on the market at a figure of $250,000.

## Nilco Lamp Works Acquires Whitelite Electric

The Nilco Lamp Works, Inc., Emporium, Pa., purchased the equipment, raw material and finished lamps of the Whitelite Electric Company, New York, on May 31. The purchase also included the transfer of the General Electric Company licenses of the Whitelite Electric Company and the New Jersey Tungsten Lamp Company to the Nilco Lamp Works, and they will be applied to increase the licensed quota of the "Nilco" lamps.

The Nilco company is moving its Type C works from Emporium and combining it with its Type B works at St. Mary's, Pa., where the general offices and warehouse will also be located eventually. This concentration of the company's operations will simplify production and facilitate shipments.

## Pelton Water Wheel Orders

The Pacific Power & Light Company has awarded a contract to the Pelton Water Wheel Company, San Francisco, for reconstructing the No. 4 turbine in its Walla Walla River plant, near Milton, Ore.. The work will include the installation of Pelton rubber-seal rings and a modern high-efficiency runner. The Pelton company recently reconstructed the No. 2 turbine in this plant, and the improvement obtained encouraged the Pacific Power & Light Company to have the same work done on the No. 4 unit.

The Montana Power Company has awarded a contract to the Pelton Water Wheel Company for furnishing two 7,500-hp. single-runner, single-nozzle impulse turbines for the first unit of its Mystic Lake (Mont.) development. These turbines will operate under an average effective head of 1,050 ft. and will embody various distinctive Pelton features such as auxiliary relief nozzles and direct-motion governors. The contract includes two hydraulic cylinder-operated gate valves at the power house and a butterfly valve at the head of the penstock. The latter will be equipped for electric motor operation and hand operation and for direct and remote control.

## Sturtevant Making Inquiries for Equipping Wisconsin Plant

The B. F. Sturtevant Company, Hyde Park, Boston, is putting out inquiries for a large list of new equipment for the manufacture of blowers and ventilating systems which will be needed for the retooling of the works of the former Wisconsin Engine Company at Corliss, Wis., recently acquired. The plant was idle six years, during which time the Corliss-engine production machinery was removed while use of the buildings was made by the government as a salvage warehouse. Harry W. Page, Boston, has been appointed works manager at Corliss.

## High Labor Costs Force Allis-Chalmers to Refuse Orders

Otto H. Falk, president of the Allis-Chalmers Manufacturing Company, has recently returned on the Holland-America liner Rotterdam after a four months' trip abroad.

"Allis-Chalmers is operating at about 75 per cent of capacity," he said, "but this is due to labor conditions, not to lack of business. We are turning down orders as we don't intend to increase labor costs because that would cause the price of our product to rise all over the country. Consequently, we are only producing our maximum with the labor we have at hand.

"Nearly all of the European countries are hard pressed for raw material. This is particularly true in Switzerland. Italy has the same lack of raw material. A number of large machinery plants in Europe have been recently closed because of this, and conditions in our line will not improve until the Rhur situation is settled.

"I talked with Dr. Cuno of Germany, and he wants to make every effort to clean up the situation. Dr. Cuno was much impressed with Secretary Hughes' proposal of an international loan to Germany by America and Great Britain. He wanted to arrange this loan and pay cash for a portion of Germany's obligations, and then have a conference of international business men, with Germany sitting in the conference, to decide how much more Germany could pay."

## Copper Export Association Sells Its Quota of 400,000,000 Lb.

The Copper Export Association, which was organized in 1921 to handle exports of copper metal for producers of the United States, has sold all of the 400,000,000 lb. of metal marked for export at that time. The association, it is said, will continue to handle the export business for the larger producers, despite the liquidation of the amount mentioned.

The association was organized at a time when the trade in metal for overseas and domestic account was at a low ebb. The larger companies continued production despite the falling off in business, and as a result stocks in large quantities began to accumulate in this country. Foreign business was not taking its usual amount of copper, and domestic buyers were not interested because of the general falling off in business. To lift a heavy load from the market, producers formed the association.

## Copper and Brass Research Body Adds Eight Members

The Copper and Brass Research Association has just added to its membership the Engels Copper Mining Company, Gransby Consolidated Mining, Smelting & Power Company, Dallas Brass & Copper Company, Merchants & Evans Company, T. E. Conklin Brass & Copper Company, J. M. & L. A. Osborn Company and Richards & Company, Ltd., the present membership of the association being composed of twenty-six copper-mining companies and fifteen copper and brass fabricating and distributing companies.

Information has just been received by the American association of the formation in England of a similar organization, the Copper and Brass Extended Uses Council, which will inform the public regarding the advantages of copper and brass for various purposes for which at present other metals or materials are being used.

## General Electric May and April Bookings Were $63,000,000

The General Electric Company during the months of April and May booked new business totaling approximately $63,000,000, or a monthly average of about $31,500,000. In the first quarter bookings were announced as $80,010,045, or a monthly average of $26,670,015. The total for the three months compared with $51,335,300 in the first quarter of 1922. This would bring the total new business taken on in the first five months of this year up to approximately $143,000,000. While indications point to bookings at an annual rate considerably in excess of $300,000,000, it is considered that if new business for this year totals between $300,000,000 and $320,000,000, the year will be a satisfactory one.

General Electric's business so far,

while diversified, is particularly concerned with heavy apparatus, with some reduction in the lines of smaller apparatus. In some lines departments are running at capacity production with business booked well in advance. The company's plants as a whole are not at present operating at capacity.

Billings of General Electric to May 1 averaged approximately $20,000,000 a month, gradually augmented because of the shipments of heavy apparatus booked over a year ago. Billings for the year may exceed $270,000,000. The current year was entered with unfilled orders of approximately $76,000,000, and with the addition of orders taken since Jan. 1, 1923, the company has had approximately $219,000,000 of business to work on.

## Rubber Independents Unite to Promote American Production

Of particular interest to electrical manufacturers is the recent formation of an independent organization known as the American Rubber Manufacturers, Inc., made up of prominent rubber manufacturers who recently withdrew from the Rubber Association of America.

These independents have been holding conferences in New York City during the last few weeks to further the growing of rubber in possessions of the United States where the climate is favorable.

It is asserted that this movement did not receive the support of the older organization. The officers of the new organization are: T. R. Palmer of the Continental Rubber Company, president; C. E. Murray of the Murray Rubber Company, treasurer, and O. M. Mason of the Mason Tire & Rubber Company, secretary pro tem.

The new organization aims to obtain assurance of a continuous supply of crude rubber, at a reasonable price, which it is stated cannot be obtained now as a result of the present British domination of the crude-rubber supply of the world. It is declared there should be a free movement of rubber unhampered by legislation which creates an artificial price for the product.

## Majestic Electric Development Company Sold

The purchase of the plant and equipment of the Majestic Electric Development Company, San Francisco, by the Majestic Appliance Company, Inc., has recently been announced. The new company will continue the manufacture of "Majestic" heaters and appliances at the San Francisco factory.

The personnel of the new company is: A. T. Burt, president; T. M. Simpson, vice-president and general manager; H. H. Daley, sales manager. According to the announcement, the entire Majestic line of air heaters, pancake and waffle irons has been redesigned and added to.

## Western Electric Company Moves Into New Philadelphia Home

On June 18 the Western Electric Company completed its move from the familiar location at Eleventh and York Streets, Philadelphia, to its new home at 910 Cherry Street. This new five-story building provides floor space of about 50,000 ft., an increase in office and warehouse capacity which has been sorely needed by the organization.

Some of the interesting features of the building, as pointed out by Manager Van Valkenburgh, are special provisions for giving service to customers. A pneumatic tube has been provided to expedite the transfer of orders from office to warehouse; conveyors have been installed for transporting merchandise with the greatest facility from the upper floors to the shipping floor, and broken package stocks are carried on the first floor, easily accessible for delivery over the wholesale counter or to the shipping platform.

Following the best modern practice, the building has been designed to obtain a maximum of light and air. In the section devoted to offices there is light and air on four sides.

## Westinghouse Offers Common Stock to Employees

The Westinghouse Electric & Manufacturing Company announces a plan whereby all employees may participate in the purchase of a new issue of 20,000 shares of common stock to be paid for on the deferred plan at $53 a share (par value $50). Each employee may subscribe for one to twenty shares of stock and pay for it in ten consecutive monthly installments.

No interest will be charged on the deferred subscription payments. When the final payment on each stock subscription becomes due, dividends at the rate declared and paid on the company's common stock after Aug. 1, 1923, when the plan goes into effect, will be credited to the account of each subscriber.

This plan will in no way interfere with the insurance saving fund now in force. In the latter plan the employee, by depositing 2 per cent of his salary in a 4½ per cent interest-bearing savings fund, obtains additional insurance up to $1,500 over the $500 given by the company after six months' service.

Subscription rights are for the benefit of the individual employed and are not transferable.

Commenting on the stock issue, E. M. Herr, president of the company, said: "This opportunity for the purchase of stock by employees is in consideration of the frequently expressed wish of our employees that they be given an opportunity to purchase common stock of this company on a favorable basis.

"We are explaining to the employees that common stock of the company, like all common stock, is necessarily subject in its value to the fluctuating conditions of business. The company is very glad to have its employees become stockholders, but it is clearly understood that their participation in the ownership of the stock is a wholly voluntary act on their part."

## Electric Furnace Maker of Ohio Sells Plant

The plant of the Electric Furnace Company, Salem, Ohio, manufacturer of electric heating and melting furnaces, has been purchased by R. F. Benziger and F. A. Hoyles, Alliance, Ohio, and F. T. Cope, Salem, Ohio. The business will be under the management of Mr. Cope, who had long been connected with the old company. Mr. Benziger will have charge of the sales department.

**The Molded Products Company**, Hartford, Conn., which was recently incorporated with capital stock of $50,000, will manufacture molded and composition products for electrical manufacture. It will not be in a position to start active business for at least six months. The company's address is First National Bank Building, Hartford.

**The Shaw Electric Crane Company**, Muskegon, Mich., has commenced the erection of a two-story addition, 60 ft. x 100 ft., estimated to cost $60,000, including equipment.

**The Lee Duncan Electric & Manufacturing Company**, 4441 Manchester Avenue, St. Louis, recently organized, is perfecting plans for the establishment of a local plant for the manufacture of electric motors and fans. Lee J. Duncan is president.

**The Esterline-Angus Company**, Indianapolis, manufacturer of graphic meters for power-testing service, etc., has purchased the plant at Speedway City, near Indianapolis, formerly occupied by the Highway Tractor Company, comprising a two-acre tract of land, improved with a building, 100 ft. x 200 ft. Extensions and improvements will be made, and the present works at 227 East South Street will be removed to this location. Additional machinery will be installed for larger production. New buildings will be erected on the site in the near future. J. W. Esterline is president.

**The Spaulding Electric Company**, Detroit, has completed plans and will soon commence the erection of a new one-story plant on Michigan Avenue for electrical repair work and parts manufacture. It will cost approximately $25,000. James G. Spaulding, 1344 Michigan Avenue, is president.

**The Hoosier Engineering Company**, specialist in power plants, announces its removal to its new building at 325 South New Jersey Street, Indianapolis.

**The Blaw-Knox Company**, Pittsburgh, has obtained exclusive license to manufacture and sell Blair water-cool parts, reversing valves and removable slag pockets.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

An agency is desired in Krakow, Poland (No. 6,811), for lighting sets for farms.

An agency is desired in Colim, Mexico (No. 6,839), for electrical machinery.

An agency is desired in Newcastle, Australia (No. 6,862), for radio equipment and appliances.

CATALOGS OF ELECTRICAL MACHINERY DESIRED IN FEDERATED MALAY STATES.—Lewis V. Fox, executive electrical engineer, Government Electricity Board, Kuala Lumpur, Federated Malay States, would like to receive catalogs and price lists of electrical machinery and accessories, hydro-electric generating machinery and high-tension aerial distribution material being of especial interest.

ELECTRICITY SUPPLY COMMISSION IN SOUTH AFRICA. — The Electricity Supply Commission provided for under the electricity act passed by the Parliament of last year, according to *Commerce Reports*, will soon hold its first meeting. It will appoint its own officials, raise its own revenue and generally act as a separate corporate body. As one of the purposes of the act is to keep the supply of electricity in bulk separate from the railways, the commission will take over the large power station in course of construction at Colenso, which will supply energy to the Maritzburg-Ladysmith Railroad when electrified. The commission will construct power stations at Durban and Witbank and will provide power near the Sabie gold fields in the Transvaal.

FUNDS PROVIDED FOR HYDRO-ELECTRIC WORK IN SOUTHERN ITALY.—A loan of 65,000,000 lire (a lira is \$0.048 at present rate of exchange), according to *Commerce Reports*, has been arranged through the Ministers of Finance and Public Works to promote the Sila hydro-electric development in Apulia and Calabria, together with similar enterprises in southern Italy. The three companies on whose behalf the loan is effected are the Societa Forze Idrauliche della Sila, the Societa Meridionale di Elettricita and the Societa Generale Elettrica della Sicilia.

## New Apparatus and Publications

FUEL OIL-BURNING EQUIPMENT.—"A Complete Treatise on the Subject of Oil Burning" is the title of a new catalog issued by the Combustion Engineering Corporation, Broad Street, New York City, in which it describes and illustrates the "Quinn" fuel-oil-burning equipment. It also contains a complete test of the oil burners conducted in a large oil refinery.

TELEPHONE HEAD SET.—C. Brandes, Inc., 237 Lafayette Street, New York, Inc., has developed the "Brandes" clutch for adjusting the receivers for telephone head sets.

COMPOUND KETTLE.—A new double-jacketed compound kettle has been brought out by the P. Wall Manufacturing Company, Pittsburgh, for use with its "Dreadnaught" furnaces for melting joint-filling compounds.

LIGHTING DEVICE.—The Reflector & Illuminating Company, 565 West Washington Street, Chicago, has placed on the market a new lighting device, "Flood-O-Lite, Jr.," form C, which is particularly adapted for the spot lighting of individual parts of a window.

ELECTRIC FURNACE.—Bulletin No. 3 issued by the Ajax Electrothermic Corporation, Trenton, N. J., describes the new Ajax-Northrup 35-kva. converter and the various standard high-frequency furnaces which may be operated from it.

GROUND CAP.—The Line Material Company, South Milwaukee, Wis., has developed a new type of ground cap.

VENTILATOR.—The Emerson Electric Manufacturing Company, 2012 Washington Avenue, St. Louis, has brought out a small "Junior" ventilator, designed for small apartment kitchens, etc.

ELECTRIC THERAPEUTIC BAKERS.—A line of therapeutical bakers for use by hospitals, general medical practitioners and specialists for treating sprains, etc., is manufactured by Walter S. Edmands, 25 Pearl Street, Boston.

SIGN RECEPTACLE.—A new sign receptacle, "Skeedoodle," designed especially for use in transparent window signs and advertising displays, has been developed by the Phelps Electric Company, 227 West Randolph Street, Chicago.

HEATING SYSTEM. — The Winslow Boiler & Engineering Company, Chicago, has brought out an electrically controlled oil-burning heating system, "Kleen-Heet," for heating residences.

VACUUM CLEANER.—The Joseph A. McAnerney Company, 62 West Forty-fifth Street, New York City, is marketing the "Mac" electric vacuum cleaner.

SWITCH BOXES.—The Roach-Appleton Manufacturing Company, 2446 North Crawford Avenue, Chicago, is manufacturing the "Raco" line of switch boxes.

ELECTRIC LAUNDRY STOVE. — The George D. Roper Corporation, Rockford, Ill., has brought out an electric laundry stove, which can be obtained in one, two and three-burner sizes.

POLARIZED LIGHT APPARATUS. — Adam Hilger, Ltd., 75a Camden Road, London, N. W. 1, has issued a booklet describing the polarized light apparatus manufactured by the firm as devised and used by Prof. E. G. Coker, F. R. S., for determining the distribution of stress in structural and machine members.

INSULATORS.—The Jeffrey-Dewitt Insulator Company, Kenova, W. Va., is distributing a new catalog covering its high-tension insulators. Bulletin No. 5 issued by the company gives the electrical mechanical characteristics of the flange-type insulators for switching equipment, bus supports, etc.

## New Incorporations

THE PLATEAU VALLEY LIGHT & POWER COMPANY, Colbran, Col., has been incorporated with a capital stock of \$100,000 by Clarence L. Fenn, George Bullock and M. R. Groves.

THE CAMBRIDGE (OHIO) LIGHT & POWER COMPANY has been incorporated with a capital stock of \$75,000 by Frank M. Taylor, Robert S. Ashe and Wilfred Jessup.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

LYNN, MASS.—The Eastern Massachusetts Street Railway Company has contracted with the Lynn Gas & Electric Company for energy and will close down its local power plant. A substation will be built on Union Street, to be equipped with three 1,500-kw. rotary converters and auxiliaries, to cost \$125,000. The capacity will be doubled at a later date.

NORTH ANDOVER, MASS.—The M. T. Stevens & Sons Company plans to build a 2,000-hp. power plant at its local textile mill, to cost about \$75,000.

PAWTUCKET, R. I.—The Blackstone Valley Gas & Electric Company has filed plans for the erection of a new one-story building at its plant on Jenks Lane for general operating service.

HARTFORD, CONN. — The Hartford Electric Light Company is erecting a new transmission line to carry electricity from the South Meadows plant to New Britain. An additional turbine will be installed in the South Meadows station, which has already been purchased.

MIDDLETOWN, CONN.—The Connecticut Power Company will soon commence work on an addition to its local power plant and will extend its transmission lines to Portland, Cromwell, Middlefield, Durham and vicinity. A new substation will be built. Plans have been prepared by the Hartford (Conn.) Electric Light Company.

NEW HAVEN, CONN.—The American Steel & Wire Company, Fairmont Avenue, will build an addition to its power house, 30 ft. x 42 ft.

## Middle Atlantic States

BUFFALO, N. Y.—Bids will be received by the Supervising Architect, Treasury Department, Washington, D. C., until June 26, for lighting fixtures for the local custom house.

COHOES, N. Y.—The Cohoes Light & Power Corporation will soon take bids for the erection of a building at its plant to be used for general operating service. William E. Goddard, 34 Remsen Street, is architect.

NEW YORK, N. Y.—The New York Edison Company plans to build a substation at 127 East 120th Street. William Whitehill, 709 Sixth Avenue, is architect.

NEW YORK, N. Y.—Bids will be received by the Bureau of Yards and Docks, Navy Department, Washington, D. C., until June 25, for the installation of a street-lighting system on naval property. (Specification 4862.)

NEW YORK, N. Y.—Electric power equipment will be installed in the ice-manufacturing and refrigerating plant to be constructed by the Realty Managers, Inc., 342 Madison Avenue, on 170th Street between Cromwell and Inwood Avenues, to cost about \$800,000.

NORWOOD, N. Y.—A hydro-electric development, including dam, power house, etc., on the Racquette River, near Norwood, to cost about \$750,000, is under consideration by the Power Corporation of New York, Light and Power Building, Watertown. W. P. Creager, Northern New York Trust Company Building, Watertown, is chief engineer.

TROY, N. Y.—Electric power equipment will be installed in the proposed grain elevator to be constructed by the State Canal Board, Albany, at the local Barge Canal terminal, to cost about \$750,000.

HOLLAND, N. J.—The New Jersey Power & Light Company will discontinue work on its proposed local generating plant. The project will be held in abeyance for an indefinite period.

KEARNY, N. J.—The Public Service Electric Power Company, Newark, has secured a site on the Hackensack River at Kearny for its proposed steam-operated electric generating plant, to have an initial output of 200,000 hp. The cost is estimated at \$2,500,000.

TRENTON, N. J.—Bids will be received by the Board of Freeholders until July 3 for motors and other electrical equipment, in connection with a new stone-crushing plant to be installed at the county quarry, Moore's Station, for which bids will be received at the same time. H. Eltinge Breed, 507 Fifth Avenue, New York, is consulting engineer.

GRANTVILLE, PA.—The Grantville Electric Company has been organized to install and operate a local commercial system. S. S. Seyfert and H. C. Stambaugh head the company.

HUNTINGDON, PA.—The Penn Central Power Company contemplates the installation of electric equipment at its coal properties, recently acquired, to be used for fuel supply for its new generating plant at Saxton, Pa.

PHILADELPHIA, PA.—A power house will be built by the Kaufman Plush Company at Mitchell and Rector Streets for service at its mill. W. E. S. Dyer, Land Title Building, is engineer.

PHILADELPHIA, PA.—The Philadelphia Suburban Company is being organized to take over and consolidate the properties of the Philadelphia Suburban Gas & Electric Company, East Pennsylvania Gas & Electric Company, Berks County Electric Company and the Bucks Electric Company. Extensions and improvements are contemplated to plants and transmission lines.

PHILADELPHIA, PA.—R. Van Horn and F. W. Woodcock, care of James Collins Jones, Bullitt Building, attorney, representative, are organizing five electric companies to be known as the Spruce Creek Township Power Company, Jackson Township Power Company, Armagh Township Power Company, Barree Township Power Company and the Cass Township Power Company to operate in the townships named. Transmission lines and distributing systems will be installed.

SCRANTON, PA.—The Suffolk Anthracite Collieries, Inc., is planning to install electric power and other machinery at its properties.

SHARON, PA.—The proposed new sewage-disposal works will be equipped with electrically operated pumps. The cost of the work is estimated at about \$200,000.

PITTSBURGH, PA.—Bids will be received by the Board of Education, Fulton

Building, until July 5, for the installation of electrical and mechanical equipment at the proposed school to be erected on Boggs Avenue. George W. Gerwig is secretary.

SPRINGDALE, PA.—The West Penn Power Company, Pittsburgh, has acquired the property of the Springdale Township Electric Corporation and plans to extend the transmission system.

GILMER, W. VA.—The Quaker Coal Company, recently organized, contemplates the installation of electric power and mechanical equipment at its properties. R. R. Biddle, 1001 Chestnut Street, Philadelphia, is head.

MARTINSBURG, W. VA.—The Eastern Sewer Pipe & Brick Company, recently organized, contemplates the installation of a power house at its proposed local plant.

MOUNDSVILLE, W. VA.—The Kerr Portland Cement Company, Wheeling, recently organized, plans to install a substation at its proposed cement mill in the Beech Bottom district, to cost about $1,200,000.

WEBSTER SPRINGS, W. VA.—Bonds to the amount of $19,000 have been voted for the construction of a municipal electric plant. The power station will be located at Cherry Falls, on the Elk River, 2 miles above the town.

WHEELING, W. VA.—The substation of the Beech Bottom (W. Va.) Power Company, at Beech Bottom, was recently destroyed by fire causing a loss of about $50,000. The structure will be rebuilt.

GLOUCESTER, VA.—The Roaring Springs Marl Company plans to build a power house at its properties.

HAMPTON ROADS, VA.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until June 26, for four 7½-hp. motors, controllers and four sets of spare parts. (Schedule 953.)

WASHINGTON, D. C.—Bids will be received by the General Purchasing Officer, Panama Canal, until July 17, for automatic telephone equipment and air-conditioning apparatus. (Circular 1528.)

## North Central States

ANN ARBOR, MICH.—The State Legislature has appropriated $250,000 for a new power plant at the University of Michigan.

DETROIT, MICH.—The Public Lighting Commission is preparing plans for the construction of an electric power plant and substation on Morrell Street, for which bids will soon be called. Smith, Hinchman & Grylls, Marquette Building, are architects.

EAST LANSING, MICH.—The State Legislature has appropriated $75,000 for an addition to the power house at the Agricultural College.

MARQUETTE, MICH.—An appropriation of $70,000 to build a new power house at the Marquette Prison has been approved by the State Legislature.

CINCINNATI, OHIO.—The Union Gas & Electric Company has applied for a permit to erect an electric substation at Mitchell Avenue and Millcreek, to cost about $22,000.

CINCINNATI, OHIO.—The Columbia Gas & Electric Company has tentative plans under way for the construction of a new electric generating plant to cost about $10,000,000, with transmission system.

CLEVELAND, OHIO.—Bids will be received at the office of the Commissioner of Purchases and Supplies, City Hall, until June 29 for outdoor weatherproof, pole-type, constant-current regulators for the division of light and power.

COLUMBUS, OHIO. — The Columbus Railway, Power & Light Company has petitioned the Public Utilities Commission for permission to erect a 13,200-volt transmission line from Bexley to the Hiberian substation.

EAST PALESTINE, OHIO.—The City Council has engaged H. O. Swoboda, consulting engineer, Empire Building, Pittsburgh, to prepare plans for an additional unit for the municipal electric plant.

PIKEVILLE, KY.—The Kentucky & West Virginia Power Company has acquired the lines and franchise of the Sandy Valley Light & Power Company and will extend the system.

CHICAGO, ILL.—The Brunswick-Kroeschell Company, 460 West Erie Street, manufacturer of ice machines, is erecting a plant at 4201-5 Diversey Parkway, including an administration building, machine shop, boiler room, pattern shop and storage and power house. The cost is estimated at $700,000.

ROCK ISLAND, ILL.—Contract has been awarded by the Peoples Power Company, Moline, for remodeling its local substation, at a cost of $25,000. New equipment, to cost $50,000, will be installed. The company will erect another 13,200-volt transmission line from the power plant at Moline to Davenport via Rock Island, to cost about $56,000.

LA CROSSE, WIS.—The Wisconsin-Minnesota Light & Power Company plans to erect a transmission line from La Crosse to French Island, and also a distributing system on the island to furnish electricity there.

SHEBOYGAN, WIS.—The ornamental lighting system on Eighth Street will be extended from Eighth Street to the Chicago & Northwestern Railway Station.

BROWNSDALE, MINN.—The local electric plant will be dismantled and connection by a high-tension transmission line with Albert Lea.

MINNEAPOLIS, MINN.—Arrangements have been made by the Northern States Power Company for extensions and improvements to its systems, including an addition to the Riverside plant at Minneapolis, to cost $1,300,000; an extension to the steam-driven electric plant at Highbridge, St. Paul, to cost $2,000,000, and additions to its plant at Fargo, N. D., and Sioux Falls, S. D.

ST. PETER, MINN.—The State Board of Control, St. Paul, has commissioned the C. L. Pillsbury Company, engineer, 1200 Second Avenue, Minneapolis, to prepare plans for extensions and improvements at the local power plant to cost about $100,000.

CEDAR FALLS, IOWA.—The Cedar Valley Electric Company, Charles City, is planning to build a power plant in Cedar Falls.

CRAIG, IOWA.—Bonds to the amount of $8,000 have been authorized for the erection of a high-tension transmission line from Craig to Le Mars, connecting with the lines of the Iowa Light, Heat & Power Company there.

DUBUQUE, IOWA.—The Dubuque Electric Company has issued $3,000,000 in bonds, part of the proceeds to be used for extensions and improvements.

SHENANDOAH, IOWA.—The City Council is reported to be considering the installation of a municipal electric plant.

SIOUX CITY, IOWA.—Work will soon be started by the Sioux City Gas & Electric Company on improvements involving an expenditure of about $3,000,000, which will include a new electric generating station, to cost about $2,000,000. The equipment will include two turbo-generators of 10,000 kw. capacity each.

ST. LOUIS, MO.—The East St. Louis Light & Power Company has applied to the Board of Supervisors of St. Clair County for permission to erect a transmission line along Mississippi Avenue from Paradise Avenue to Valentine Street in East St. Louis. The proposed line will connect with the Cahokia plant now in course of construction on the river bank south of the Municipal Bridge.

SWEET SPRINGS, MO.—The Kansas City (Mo.) Power & Light Company has applied to the Public Service Commission for permission to purchase and operate the local electric plant.

JAMESTOWN, N. D.—Bids will be received by the State Board of Administration, Bismarck, until June 26 for equipment for power house at the State Hospital for Insane.

## Southern States

NEW LONDON, N. C.—Plans are under way for a municipal electric lighting plant, for which bonds have been voted. J. W. P. Hill is in charge.

PROSPERITY, S. C.—The Saner Lumber Company, Inc., plans to build a power house at its proposed local mill.

THOMASVILLE, GA.—Plans for the proposed new John D. Archbold Memorial Hospital, to cost about $1,000,000, include a power house and refrigerating plant. E. C. Wachendorff, Forsyth Building, Atlanta, is architect.

HOGANSVILLE, GA.—The Stark Mills, Inc., operated by the International Cotton Mills, Inc., 60 Federal Street, Boston, contemplates the installation of an electric substation at its proposed local mill to cost approximately $425,000.

JACKSONVILLE, FLA. — Plans have been prepared by the Schofield Engineering Company, Philadelphia, for an addition to the electric power plant on Talleyrand Avenue and for two new substations, for which, it is understood, bids will soon be called.

JENNINGS, FLA.—The Electric Power Commission is planning to build a hydro-electric plant on the Alpha River to develop 1,600 hp. Transmission lines will be erected between Jennings and Jasper, White Springs and other points in Hamilton County.

STARKE, FLA.—Bids will be received by the Board of Trustees until June 26 for equipment for a municipal electric plant, including two electric generating units, driven by crude-oil engines, each 75 kva. capacity; two electrically driven impeller pumps, submerged type, to operate under 100-ft. and 150-ft. head respectively; storage tank, meters, auxiliary equipment. Joseph E. Craig, 427 King Street, Jacksonville, is consulting engineer.

MEMPHIS, TENN.—The Ford Motor Company, Highland Park, is reported to be planning to construct a power house at its proposed local assembling plant, to cost about $175,000.

BIRMINGHAM, ALA.—The Alabama Power Company, which is erecting a high-tension transmission line from Coosa River to Opelika, will erect a primary substation at New Aubery, where energy will be transformed and transmitted into the company's 44,000-volt lines from Opelika to Lafayette, Roanoke, Auburn, Waverly, Camp Hill, etc. The cost is estimated at $1,000,000.

CHEROKEE BLUFFS, ALA.—The Alabama Interstate Power Company, a subsidiary of the Alabama Power Company, has secured permission to construct and operate a hydro-electric power plant on the Tallapoosa River, near Cherokee Bluffs, to develop 105,000 hp., to cost about $1,000,000.

TALLADEGA, ALA.—An electric substation and transmission system will be constructed for service at the new municipal waterworks, to cost about $265,000.

HATTIESBURG, MISS.—A power house will be erected by the South Mississippi Infirmary at its new hospital, to cost about $175,000. Benjamin Price, Jefferson County Bank Building, Birmingham, Ala., is architect.

JACKSON, MISS.—The Mississippi Power & Light Company has been organized to take over and consolidate the Jackson Public Service Company; Vicksburg Light & Traction Company, Vicksburg; Delta Light & Traction Company, Greenville, and the Columbus Railway, Light & Power Company, Columbus, Miss. The new company plans to erect connecting transmission lines and also extensions to power stations, etc.

BLYTHEVILLE, ARK.—The erection of a high-tension transmission line from Caruthersville connecting Blythesville with the former and Kennet, Mo., is under consideration by the Missouri-Arkansas Power Company. The company is reported to be considering building a substation at Steele, Mo., to serve Steele, Noland, Cotter and other towns in the community.

HOT SPRINGS, ARK.—The Arkansas Light & Power Company has preliminary plans for the construction of a hydro-electric power plant on the Carpenter Dam site, with initial capacity of 12,000 kw. A similar plant is also planned at the Remmel Dam, now in course of construction, with 18,000 kw. initial capacity. Extensive additions will be made to the transmission system. The total cost is estimated at about $4,000,000. Work will soon begin on the proposed hydro-electric station on the Ouachita River, near Malvern, to develop about 15,000 hp., at a cost of about $1,500,000.

NEW ORLEANS, LA.—The Cloverland Dairy Company, Carrolton Avenue, contemplates the installation of a power house at its proposed plant, to cost about $250,000. Fayret & Liraudais, Hibernia Building, are engineers.

OKLAHOMA CITY, OKLA.—Plans are being considered by the Toledo & Ohio Central Railway Company, St. Clair Avenue and West Third Street, Cleveland, for rebuilding and equipping for electrical operation the Shawnee branch of the Missouri, Kansas & Texas Railway Company between Oklahoma City and Shawnee. The cost is estimated at about $2,600,000. J. A. Stocker, Columbus, Ohio, is chief engineer.

SAYRE, OKLA.—The City Council is having plans prepared for municipal improvements, including extensions to the ornamental lighting system, power plant, a complete disposal plant, etc. V. V. Long & Company, Colcord Building, Oklahoma City, are engineers.

HULL, TEX.—The Gulf Production Company is planning to build an electric plant in the Hull oil field, including the erection

of transmission lines to the oil fields at Batson, Saratoga and Sour Lake. The cost is estimated at about $750,000.

TEMPLE, TEX.—The power plant and mechanical shops of the Southwestern Traction Company were recently destroyed by fire causing a loss of about $100,000.

## Pacific and Mountain States

ABERDEEN, WASH.—The Pacific Cedar Manufacturing Company contemplates the construction of a power house at its proposed local mill, to cost about $150,000.

BLEWETT, WASH.—The Pehastin Lumber & Box Company is considering plans for rebuilding its mill and power house, recently damaged by fire.

LONGVIEW, WASH. — The Longview Public Service Company has acquired the property of the Long-Bell Lumber Company. Extensions will be made including the construction of a 20,000-kw. power plant, and transmission lines to supply electricity for light and power service throughout this district.

SEATTLE, WASH.—Plans are being prepared for the proposed North substation to be erected at Seventy-fifth Street and Eighth Avenue, Northeast, which will distribute electricity generated at the Skagit River plant. C. F. Uhden, Alaska Building, is chief engineer of the Skagit River project.

LA JOLLA, CAL.—Steps have been taken for the installation of an ornamental lighting system on Exchange Place.

LOS ANGELES, CAL.—The City Council has instructed the city attorney to prepare the necessary resolution authorizing the Bureau of Light of the Public Service Department to furnish electricity and maintenance for fifty lighting districts.

SAN FRANCISCO, CAL.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until July 3, for one 200-kw. motor-generator set complete, with four-panel switchboard, for the Mare Island navy yard. (Schedule 943).

SAN FRANCISCO, CAL.—The Pacific Gas & Electric Company will build a new substation in the vicinity of Montgomery and Sacramento Streets. The initial installation will include three 2,600-kw. rotary converters. Provision will be made for five additional rotary units of same rating. The cost is estimated at $300,000.

SAN JOSE, CAL.—Bids will be received by the Board of County Supervisors, San José, until July 2, for refrigerating and ice-making machinery, and also for construction of a building for same at the Santa Clara County Hospital, San José. Binder & Curtis, San José, are architects.

SANTA ANA, CAL.—An ordinance has been adopted providing for the installation of an ornamental lighting system on West Fourth Street, consisting of eighty-six double lamp standards.

VAN NUYS, CAL.—The Municipal Power Department will build an electric substation at the proposed service and repair plant for city automobiles, to cost about $100,000.

RENO, NEV.—The Nevada Magnesite Products Company, recently organized, plans to construct a power house at its proposed artificial stone plant, to cost about $125,000. Paul Butler is vice-president.

## Canada

RUSKIN, B. C.—Plans have been prepared by the British Columbia Electric Railway Company, Vancouver, for a 10,000-kw. hydro-electric plant at Stave Lake, to cost about $750,000. Preliminary surveys are being made for a dam and power plant to develop from 80,000 kw. to 100,000 kw. on Stave River, 2 miles north of Ruskin, to cost from $6,000,000 to $8,000,000. R. S. Kelsch, Power Building, Montreal, Que., is consulting engineer.

FORD CITY, ONT.—Plans have been prepared by the Ford Motor Company of Canada for a power house, 112 ft. x 148 ft., two stories, and a screen house, 27 ft. x 31 ft., to be erected on Sandwich Street.

QUEBEC, QUE.—The city officials have appropriated $30,887 to be used by the exhibition committee for the installation of a lighting system in the Industrial Palace and exhibition grounds.

VERDUN, QUE.—The City Council has passed a by-law to be submitted to the ratepayers providing for an expenditure not exceeding $275,000 for local improvements, of which $9,000 will be used for extension of lighting system and $10,000 for transformer station and transformers for the electric lighting system.

# Electrical Patents

Announced by U. S. Patent Office

(Issued May 29, 1923)

1,457,023. AUTOMOBILE HAND-SIGNALING DEVICE; A. R. Ferguson, Buffalo, N. Y. App. filed Oct. 5, 1920. Signal light attached to hand.

1,457,052. SYSTEM OF ELECTRICAL DISTRIBUTION; E. B. Birch, Pittsburgh, Pa. App. filed June 25, 1921. Auxiliary supply takes care of abnormal loads.

1,457,069. RECEIVING SYSTEM FOR ELECTRIC WAVES; L. Levy, Paris, France. App. filed Sept. 27, 1919. Medium and low frequency detector-selector-amplifier provided with vacuum tubes.

1,457,075. DEVICE FOR PRODUCING OR REPRODUCING SOUND; C. H. Hulbert, Chicago, Ill. App. filed March 21, 1917. Increased magnetic area of telephone receiver diaphragm.

1,457,149. PREPARING ALUMINUM OR ITS ALLOYS FOR ELECTROPLATING; H. D. Cunningham, Brighton, England. App. filed May 10, 1920.

1,457,170. TIDAL WATER-POWER PLANT; A. Huguenin, Zurich, Switzerland. App. filed Oct. 5, 1921.

1,457,171. CONDUIT END FITTING; F. I. Johnson, Warren, R. I. App. filed Aug. 27, 1920.

1,457,173. ELECTRICAL DIRECTION INDICATOR; H. Kageyama, Los Angeles, Cal. App. filed May 1, 1918. For automobiles.

1,457,176. BURGLAR ALARM; J. E. Lee, Milwaukee, Wis. App. filed Oct. 9, 1920. Electrically operated device fires cartridges.

1,457,211. RECEIVER FOR TELEPHONES; V. C. Crites, Los Angeles, Cal. App. filed June 29, 1922. Protects ear from direct contact with receiver shell.

1,457,225. METHOD OF MAKING MAGNESIUM; G. Hutchinson, Arcadia, Cal. App. filed June 1, 1922. By electric fusing process.

1,457,239. LAMP FILAMENT AND SUPPORT; A. S. Volpian, Savannah, Ga. App. filed Oct. 25, 1921.

1,457,249. ELECTRICAL PROTECTOR; G. W. Janson, Brooklyn, and L. H. Rovere, Richmond, N. Y. App. filed July 12, 1921. Telephone lightning arrester.

1,457,262. SHOT-FIRING DEVICE; H. Neal, Yukon, Pa. App. filed Feb. 25, 1922. Electrical device for firing explosives in mines.

1,457,263. AUTOMOBILE SIGNAL; G. W. Nicholson and A. J. Kelly, Indianapolis, Ind. App. filed April 4, 1919. Direction signal.

(Issued June 5, 1923)

15,617 (reissue). MEASURING AND INDICATING APPARATUS; H. Brewer, Wilmette, Ill. App. filed Feb. 21, 1919. Thermocouples for measuring temperature.

1,457,312. REVERSING MECHANISM; O. J. Marshick and E. L. Crosby, Detroit, Mich. App. filed Nov. 15, 1920. Automatically reversing rotation of electric furnace drum.

1,457,336. BALANCING CIRCUITS; H. A. Affel, Brooklyn, N. Y. App. filed Sept. 30, 1919. Translating low-frequency signals into higher-frequency carrier currents and vice versa.

1,457,338. SELECTIVE CONNECTION OF TRUNK LINES; L. D. Barrows and L. H. Darrow New York, N. Y. App. filed April 1, 1919. Connecting any one of several telephone substations to a common line passing through all stations.

1,457,359. SYSTEM OF CONNECTIONS FOR MULTIPHASE CHOKING COILS; A. Gaudenzi, Baden, Switzerland. App. filed Aug. 29, 1921. Used with mercury-vapor rectifiers.

1,457,381. DYNAMO-ELECTRIC MACHINE; A. H. Midgley, Uxbridge, England. App. filed April 3, 1922. Constant-output, variable-speed generator.

1,457,438. PERMEAMETER FURNACE; G. A. Kelsall, Belleville, N. J. App. filed March 23, 1921. Device to determine characteristics of magnetic materials at elevated temperatures.

1,457,440. INCANDESCENT ELECTRIC LAMP; C. E. Leece, Youngstown, Ohio. App. filed July 6, 1921. Supplied with two or more filaments.

1,457,447. RADIO RECEIVING CIRCUITS; J. Mills, Wyoming, N. J. App. filed Dec. 22, 1921. Employs principle of successive detection.

1,457,473. COMBINATION TAIL LIGHT AND DIRECTION INDICATOR; A. E. Tinker, Stockton, Cal. App. filed March 16, 1921. For automobiles.

1,457,475. ELECTROMAGNETIC APPARATUS; R. W. Van Norden, San Francisco, Cal. App. filed Jan. 28, 1920. Minimizing losses due to eddy currents in generators, transformers, etc.

1,457,508. FOUNTAIN SOLDERING TOOL; A. Dellman, Mount Clemens, Mich. App. filed May 16, 1921. Electric soldering iron.

1,457,513. ELECTRIC WELDING MACHINE; J. W. Fay, Milwaukee, Wis. App. filed April 19, 1920. For automatically welding long seams and joints.

1,457,597. BATTERY AND BULB TESTER; O. Ohmart, Cairo, Ill. App. filed Sept. 15, 1921. Arrangement of contacts on test board.

1,457,619. AUDIO-FREQUENCY COUPLING TRANSFORMER; S. Cohen, Brooklyn, N. Y. App. filed May 12, 1921.

1,457,671. BATTERY CASE AND SWITCH; W. H. Rector, Williamson, W. Va. App. filed Jan. 17, 1923. For detonating blasting charges.

1,457,677. TROLLEY REPLACER; M. M. Sykes, San Francisco, Cal. App. filed Oct. 26, 1922. Auxiliary guide wheel.

1,457,688. PROCESS OF AND APPARATUS FOR RENOVATING COATED METAL SHEETS; C. F. H. Bohnhardt, Baltimore, Md. App. filed March 8, 1919. Removing lacquer, japan, paint, etc., by electrolysis.

1,457,689. CROSSOVER FOR OVERHEAD TROLLEY LINES; G. W. Bower, Schenectady, N. Y. App. filed Oct. 30, 1922. For points where single trolley wires cross lines of trackless trolley.

1,457,690. ELECTRICAL HEATER FOR OIL WELLS; P. F. Brine, Boston, Mass. App. filed March 22, 1921. For melting paraffin or other heavy products found in oil wells.

1,457,718. ELECTRIC FURNACE; I. R. Valentine, Erie, Pa. App. filed May 5, 1921. For brass, aluminum and copper melting.

1,457,784. TRANSFORMER; E. P. Maurer, Cleveland, Ohio. App. filed Sept. 6, 1919. Bell-ringing type.

1,457,791. PROCESS OF MAKING SUCCINIC ACID; J. F. Norris and E. O. Cummings, Cambridge, Mass. App. filed Oct. 20, 1922. By electrolytic process.

1,457,792. ELECTRICALLY HEATED FLATIRON; R. B. Older, Danville, Ill. App. filed April 14, 1921. Releasing hand from handle cuts off current.

1,457,814. AMPLIFIER; H. I. Becker, Schenectady, N. Y. App. filed Dec. 14, 1921. Magnetically controlled electron-tube amplifiers.

1,457,818. SIGNAL; C. W. Brown, Cleveland, Ohio. App. filed Feb. 1, 1922. Direction signal for automobiles.

1,457,851. VOLTAGE REGULATOR; A. F. Nesbit, Wilkinsburg, Pa. App. filed Aug. 27, 1921. Resistance elements inserted by temperature control.

1,457,863. DEVICE TO CONTROL THE TEMPERATURE OF STORAGE BATTERIES IN AUTOMOBILES; W. A. Strawmyer and V. Beaman, Atlanta, Ga. App. filed Nov. 4, 1920. Prevents overcharging.

1,457,873. HEAT-FOCUSING DEVICE FOR COMBINED ELECTRIC LAMPS, HEATERS AND BLOWERS; W. A. Brown, Philadelphia, Pa. App. filed Sept. 14, 1922. Telescopic casing for combined lamp, heater and blower.

1,457,874. COUNTERBALANCING AND OSCILLATING DEVICE FOR ELECTRIC HEATERS AND LAMPS; W. A. Brown, Philadelphia, Pa. App. filed Sept. 14, 1922. Combined heater, blower and lamp.

1,457,896. MOTOR-BRUSH HOLDER; J. R. Cook, Cleveland, Ohio. App. filed Aug. 12, 1921. For small alternating-current series motors.

1,457,898. TELEPHONE SYSTEM; W. L. Dodge, Maplewood, N. J. App. filed July 19, 1919. Relates to systems where signals are transmitted over trunk extending between widely separated offices.

1,457,902. CURRENT RECTIFIER; C. J. Gardeen, St. Paul, Minn. App. filed May 9, 1921. Mechanical rectifier.

1,457,912. TELEPHONE SYSTEM; H. D. MacPherson, Summit, N. J. App. filed Dec. 31, 1919. Signals for trunk lines controlled over single path common to lines.

1,457,920. ELECTRIC MOTOR CONTROL SYSTEM; T. Zewigbergk, London, England. App. filed Aug. 20, 1931. Electrically driven controller is actuated by manually operated master controller.

1,457,923. METHOD AND APPARATUS FOR MEASURING ELECTRIC RESISTANCES AND THE LIKE; M. Coppée, Mont-sur-Marchienne, Belgium. App. filed Nov. 12, 1921. By connecting element to be measured to armature of generator of constant field, subjecting armature to a constant couple and then measuring the speed of rotation of armature.

1,458,098. METHOD OR MEANS FOR AMPLIFYING OR OTHERWISE INDICATING SMALL MECHANICAL EFFECTS; E. S. Heurtley London, England. App. filed April 11 1919. For submarine cable signals.

## Which Type of Load?

WHAT sort of business should the central-station company select for creative sales development? The question lies face up upon the table. It is a fundamental question to every light and power company. It has always confronted the utility in each community. Strangely enough, however, no organized effort has ever been made to find a definite solution of the problem and to establish on a fact basis which type of load pays best.

IN THE beginning there was only light to sell. Then came power, then domestic cooking, then industrial heating, then the electric vehicle. Now, household appliances are receiving the conspicuous attention. Each new step in the evolution of load has won the center of the stage and held it for a time, the nine-day wonder of commercial opportunity. And so central-station selling through the years has been dominated more by new enthusiasms than by any process of discrimination, more—in a word—by fad than facts.

Today we reach the stage where in an average community there are a dozen different types of load that may be developed profitably. Three national programs of promotion are now in process in which advocates of the electric range, of the electric truck and of industrial heating will all be striving to convince the utility executive that in each of these three directions lies the most attractive waiting market. The truck man points out that one electric garage provides more load than 4,000 dwellings. Another contends that the diversity factor of household appliance business and the ready merchandising profit that comes with it make this field the one which should be cultivated first — and so on. Which is right?

GRADUALLY all kinds of business will be taken on in balanced proportion. Public demand will see to that. But the immediate issue with the central station is just an ordinary business problem. There is at hand so much capacity to sell—no more. Which type of load will pay the best return for the investment? That is the point. And what will be the cost of selling?

The need is for intelligent selection—based upon facts, unwarped by fad or fancy. Sooner or later each company must and will know the actual relative worth of every class of business. And it will sell its energy in the way that pays the best. Is it not time that as an industry we should begin to classify and formulate available experience so that any central-station man may know what kind of load to seek and why? Here is a task to which the N. E. L. A. Commercial Section may well apply itself.

# Robert Francis Pack

*An English boy who, by way of Canada and by unremitting application to the practical side of the electrical art, advanced to the vice-presidency of two great companies in Minnesota.*

BORN on the Isle of Wight, England, in 1874 and educated as a boy for the British Navy, Robert F. Pack came with his parents to Canada in 1889. In 1891 he entered the service of the Toronto Electric Light Company as an office boy and became successively accountant, comptroller, secretary and general manager of that company. He resigned from that company in September, 1912, to accept the post of general manager of the Minneapolis General Electric Company, one of the chief of the properties owned by the Byllesby interests. In 1916 he became vice-president and was appointed as well vice-president, general manager and a director of the Northern States Power Company.

Mr. Pack's wide knowledge of the central-station business has been gained entirely through his practical contact with the industry in the last thirty-two years. He "grew up" with the Toronto company, which, when he entered its service, was solely concerned with lighting the streets and a few of the principal stores by means of old-type arc lamps. While in Canada he took much interest in the Canadian Electrical Association and was largely instrumental in bringing about its affiliation with the National Electric Light Association about twelve years ago. In 1912 he was elected president of the Canadian Electrical Association.

In June, 1917, Mr. Pack was appointed by the Governor of Minnesota a member of the State Board of Arbitration to represent employers. This board consisted of two members only, the other member representing employees. During the entire period of the war no strikes or labor disturbances of any kind took place in Minnesota which were not promptly adjusted by the board.

At the convention of the N. E. L. A. at Atlantic City in May, 1922, Mr. Pack was elected fourth vice-president, and at the recent New York convention he was advanced to be third vice-president. He is a strong believer in the human equation in business, and the Minneapolis company is noted for its excellent relations with its employees and also for the highly satisfactory public relations it maintains with its customers.

Mr. Pack has been of great service to the industry in connection with the co-operative work of the lighting and telephone companies on inductive co-ordination. When this work began there was more or less hostility and suspicion. Owing, however, to Mr. Pack's personality, consideration and tact, all suspicion has been allayed and complete harmony prevails between the two industries.

Mr. Pack is a member of the A. I. E. E. and of various societies in Minneapolis.

# Editorial Comment

Electrical World, June 30, 1923

Volume 81 Number 26

## American Ships for American Commerce

IT OUGHT to be a matter of pride to Americans that the Stars and Stripes trails over the stern of the largest passenger ship sailing the seas. The Leviathan, reconditioned and largely rebuilt after memorable service as a transport during the war, now flies the pennant of the United States Lines, signifying that once more Columbia is the "gem of the ocean," and also, let us hope, that Columbia will occupy its former place in the shipping world. While we would much prefer that American ships should be privately owned and operated and that American seamanship should stand on a parity with the seamanship of other nations, these are conditions which eventually will obtain. The significant thing, and the all-important thing, to us is that the American flag shall remain on the seas, because it stands for American commerce, for American enterprise and for American freedom. With the growth of foreign trade, with the abandonment of ideas of national isolation which were never embraced by any political party or enlightened group of citizens and which the progress of invention has made forever impossible, and with American pay, American comforts and the American type of discipline superseding the Old World conditions that formerly made a sailor's life repugnant to lads reared in a democracy, the rebirth of the United States marine should be at last assured.

## The Man Who Recognized the Importance of Public Relations

IN CONTEMPLATING the wonderful development of the electrical industry it is curious to note the changes in points of view that have taken place in a comparatively short time. Time was when the engineering and operating features of electric central stations were deemed to be the factors of most importance, but within the last two years the company executives have been giving more and more time to the question of public relations. It is recognized that the amenities and courtesies to customers which cost so little have a vast influence on the prosperity of public utilities. Thus what was once considered of secondary importance is now beginning to be paramount.

Without doubt the electric light and power companies possess the keenest appreciation of the value of good public relations, and the man who has done most to convert the industry to this state of mind is Samuel M. Kennedy of the Southern California Edison Company of Los Angeles. Up to the time of his pamphlet, "The Man in the Street," little was thought about public relations and much less was done to improve them. However, the more the subject was investigated the more important it was seen to be, and Mr. Kennedy's book, "Winning the Public," appeared at a most opportune time. It was written in a lucid and racy style; its logic was unassailable, its argument convincing, its presentation cumulative and complete. It may almost be said to have taken the central-station world by storm and did more to arouse the minds of executives to the importance of proper public relations than anything that ever appeared in print. Experience, particularly in California, has shown the great advantages inherent in Mr. Kennedy's philosophy. Elsewhere in the country where his precepts have been heeded excellent results have followed. Certainly, in many a crisis good public relations have been the salvation of the industry, and witness was borne to the now universal recognition of their importance by the large part of the program of the last National Electric Light Association convention devoted to their consideration. The industry should not forget the debt of gratitude it owes to the man who was chiefly instrumental in bringing the whole question into prominence.

## The Economic and Political Importance of Power

THE attention at present devoted to the subject indicates that engineers and statesmen have awakened to the importance of economic power development not only in this country but throughout the world. People have come to realize that where there is no power there is no industry worth talking about. Labor leaders who were fearful that the substitution of power for human labor would throw large numbers of men out of employment have lived to see that it has no such effect, but that, on the contrary, because of the application of power working and living conditions have become better, the laborer receives a higher wage, and instead of a surplus an actual shortage of labor exists, at least so far as this country is concerned.

From an economic as well as from a political standpoint an ample supply of power is a great asset to any state or nation. That is why Pennsylvania proposes to engage in a giant power survey. The Governor of the Keystone State has broadened considerably. His views on conservation are much more intelligent and far-reaching than when he was head of the Forest Service. He now seeks the most efficient development of the state's great fuel-power resources supplemented by water power and the pouring of the general output of these fuel and water-power resources into a common reservoir of interconnected transmission lines covering the whole Northeastern section of the country, from which factory, farm and home can draw.

Adversity is a great teacher, and out of the welter of fire and blood France and Italy have merged with one economic fact clearly defined; that is, the necessity of the development of the water-power resources of the respective nations and the substitution of hydro-electric energy, now in large part running to waste, for expensive power produced from imported coal. Italy

is particularly keen about interesting foreign capital in this work, but has not refused state aid when such capital was not forthcoming. Power has become a subject of world-wide interest, and the surveys that have been made and are being made by the electric light and power industry in the various states were begun none too soon. The demand for power seems insatiable, and it is wise and prudent that those engaged in the business of supplying it should know exactly what the resources are. The World Power Conference scheduled to be held in London next year indicates very clearly how important the question of power supply is becoming throughout the world.

## What a Wonderful Family It Is!

IN THE endeavor of the electrical industry to apply electrical power intelligently to all human needs its structure has become an immense edifice with rooms filled with many men occupied in many activities. Just as the reverberations of the big N. E. L. A. convention dissolve into the distance the Electric Power Club gathers the manufacturers into its fold in annual meeting, the Canadian Electrical Association congregates at Montreal and the A. I. E. E. announces its program for the summer convention at Swampscott. Various other units and organizations in the industry are meeting in local territories, and, as a whole, there is a milling and stirring of busy men at conventions.

Remarkable to relate, each of these electrical groups finds ample work to do, interesting and informative material for programs, committee activities that make for progress, and common interests for holding and inspiring the membership. In fact, the general complaint is of the lack of time available for doing the work that needs to be done to improve the status of the industry. Yet the best thing about the conventions is their educational value and the family spirit that they arouse in the industry. Each has a definite field with boundary lines vaguely defined so that many men of many occupations are brought together. If, for example, the power salesman, the operating engineer, the designing engineer and the technical specialist come together at an A. I. E. E. meeting, all benefit and react upon one another to bring the balance, the knowledge, the close acquaintanceship and the common goal that enable the industry to progress intelligently.

How valuable it would be to have at each of these conventions all the major problems of the industry outlined and discussed! Think of presenting the cream, so to speak, of the activities and thoughts of each phase of the electrical business to groups of men whose detail responsibilities in the industry are so diverse. And the trend is in this direction at all the big conventions. No longer are the technical, commercial, executive and operating groups herded into separate and closely guarded corrals to tackle separately things that affect the whole industry and need the co-operative efforts of all to accomplish.

How encouraging it is to find the electrical industry composed of men linked together for a common purpose —the salesman knowing and interested in the work of the specialist, the executive knowing and appreciating the problems of the engineer, and the financier co-operating cordially with the executive because he knows him and his objectives. Each has something the other requires in his business, and each has come to appreciate the human and social aspects of the association that has developed.

May this wonderful electrical family continue to mingle and to direct its co-operative efforts along the sound constructive lines followed today! Conventions give value received in tangible and intangible assets and should be encouraged and directed with foresight and wisdom.

## A Commission Talks on Legal Aspects of Merchandising Policy—Other Considerations

AN INTERESTING opinion on central-station merchandising policy was expressed in the decision of the Maryland Public Service Commission, reported last week, in which the rates of the Consolidated Gas, Electric Light & Power Company of Baltimore were reduced. Certain dealers of that city had petitioned the commission to restrict the company in its merchandising activities. The opinion of the commission on this point is published elsewhere in this issue.

The Baltimore utility has long been a most active retailer of merchandise, selling out of its store not only gas and electric appliances, but other household equipment, embracing at one time tableware, crockery, glass, kitchenware, cutlery and other "kindred" lines. It operated in effect a department store in which were grouped a large variety of associated household commodities.

The commission said:

"In our opinion the whole field of the ordinary gas and electric appliance business in Baltimore soon will be filled by the company. It is but a step to wiring and pipe fitting. At times the merchandising has bordered on the grocery trade."

But "the terms offered are easy and popular," and although the company enjoys advantages of contact for both selling and collecting that "make the keenest competition and shrewdest merchandising by private concerns futile and vain," the commission, because it "failed to discover any organized opposition or outspoken objection on the part of retail business or skilled labor," declined to interfere. Speaking of the financial side of retail selling, the commission did say, however, that the profit from merchandising "must be reported by the company as miscellaneous revenue," unless "capital for the merchandising department" is "provided from an independent source and charges for rent and services made at adequate and remunerative rates."

This opinion, of course, deals only with the legal aspect of the situation. It does not advert to any possible influence on public relations, for it is not the function of the commission to preach business policy. Yet here is a factor no less vital to the public service company. The question is whether a utility is wise in using powers and capital virtually provided by the public with the intent that they should be applied in a definite public service to enter into competition with individual merchants of the town, whose trade the company decides to invade, though in a field not directly related to that public utility service which the company is organized to render. The commission properly does not express itself as to this, but central-station executives would do well to give the point some thought, for they have more than the legal aspect to consider.

The ruling of the commission as to the revenue from merchandising is just one more sound argument that the retail merchandising business of a central-station

company should be made to stand on its own feet, paying its costs and interest on the capital employed. It suggests that this department may profitably be separately organized, financed and operated if the revenues from merchandise sales are not to be included in reported company earnings.

### Cost Analysis in Small Plants

AN INTERESTING and comprehensive method of studying production costs and overhead charges in small steam and oil-engine plants is presented in this issue by L. V. H. Armstrong. Too little work of this sort has been done in the past, and more must be done in the future. Small central stations bulk large in numbers in the census of the industry, and apart from the spur of necessity to secure low-cost operation, little companies and their larger brethren are or should be keenly interested in getting at the real figures of power-plant economy in installations of a few hundred horsepower or less. The decision of the power user to purchase central-station energy often turns on a very small margin of money, and if this small-power business is to be handled properly from both the generating and the energy sales sides, exactly such studies as Mr. Armstrong has made must become more general.

Power engineering readers will question some of the assumptions of the author, especially in regard to fixed charges in small oil-engine stations. Current opinion in such circles inclines toward a much shorter internal-combustion prime-mover life than is indicated by a depreciation charge of 5 per cent. We have recently seen a maximum guarantee by a reliable oil-engine maker of only seven and a half years' life. Mr. Armstrong has allowed 5 per cent for obsolescence in addition to the above depreciation charge, but the spread between his figures and what leading central-station power engineers regard as conservative is marked and should be reinforced by more data from practice as time goes on. Bearing insurance and taxes in mind, it seems likely that total fixed charges on small oil-engine stations must run nearer 19 or 20 per cent than the 15 per cent assumed. Such figures may change the outcome of particular analyses, but of course they do not affect the value of the method of attack so logically and clearly set forth by the author.

The present state of the art of internal-combustion-engine design and operation forces the analytical engineer and executive to recognize all the factors entering into a final decision to adopt such types of units for commercial service. Many closely adjusted parts are found in typical prime movers of this sort, and continued efficiency in service depends in no small degree upon their close fitting and functioning. Maintenance runs high for this reason. Users in many cases complain vigorously of the high cost of spare parts. Insufficient consideration is often given to the amount of cooling water required, as well as to the increased cost of labor for properly operating such units. The question of reliability is all-controlling in numerous installations, and with some types of engines at least much remains to be accomplished on this score. These comments are somewhat aside from the paper of Mr. Armstrong, but in utilizing the methods of analysis therein illustrated due weight should be given to the characteristics of available apparatus, the guarantees of manufacturers and the results of experience.

### The Problem of Insulation

A STRIKING example of the dependence of applied science on pure scientific investigation is presented in the problems of electrical insulation. In the early days of electric power, by reason of the low values of voltage, the safe insulation of electrical equipment introduced no serious difficulty. With increasing voltage, and with appreciation of the importance of temperature, however, the serious limitations of the available insulating materials began to be realized, and in the early nineties there began among manufacturers a serious study of the properties of the known solid, flexible, plastic and fluid dielectrics. Ever since then that study has continued, and as a result we now have at our disposal a remarkable variety of insulating materials, with a wide range of properties, and therefore adapted to the construction of almost any type of electrical device or machine.

In spite of this wealth of material, however, it remains a fact that the design of insulation for high-voltage duty is not based on known laws, is not subject to exact computation and is, in fact, in most cases largely a matter of putting in enough material to prevent initial puncture or flashover at a voltage three or four times the operating value. Such questions as the influence of homogeneity, of mixtures, of temperature, of dielectric loss and of frequency on the disruptive strength and life of insulation are only remotely understood. Although, as indicated, many new materials and improved methods of manufacture have been developed, there is probably no field of experimental electrical study in which the returns in new knowledge have been so meager.

In this state of affairs the committee on insulation of the National Research Council has crystallized the prevailing opinion of electrical engineers that the rational design of insulation with a fair certainty as to its subsequent behavior can come only with a further scientific knowledge of the ultimate nature of the processes involved. The committee in its first report, published in the June *Journal of the A. I. E. E.*, therefore calls for a concerted effort, by physicists and those insulation experts who are familiar with the underlying theory of dielectrics and are skilled in the methods of pure research, toward the solution of the several great unanswered problems of dielectric behavior. In addition to an instructive descriptive statement of the entire problem of insulation, the report also makes specific suggestions of problems for experimental attack under seven major headings and invites co-operation in the prosecution of the work itself. This co-operation it expects to obtain from industrial, university and national research laboratories.

We are accustomed now to large undertakings in the research field by electrical and other manufacturers, but here is a call for co-operative attack by all research laboratories on some of nature's most deeply hidden secrets, yet which are of the foremost importance for the further service of mankind as offered by the electrical engineer. Certainly such an opportunity and such a call should meet a ready response from all who are qualified to respond. If the work is actively prosecuted and its co-ordinated results are digested and recorded by competent experts, it is certain that this undertaking will yield results of immense value to an industry which must place large dependence on insulation.

# The Detroit Edison's Meter Laboratories

## How Meters Are Calibrated and Inspected on a System Where 340,000 of Them Are Installed—Standardizing and Testing Laboratories Equipped to Test 100,000 Meters a Year—Meter Department Organization

By A. S. ALBRIGHT
*Superintendent of Meters, Detroit Edison Company*

INTERIOR OF CALIBRATION ROOM, SHOWING TEST BOARDS AND PORTABLE TRUCKS

GOOD service necessitates the use of well-maintained meters, and in addition the central-station company must have accurate meters if it is to derive the full income from its service. With the development of many types and sizes of meters and the increased number of meters installed, it becomes increasingly difficult to operate a meter department efficiently. Commission regulations in regard to testing meters for accuracy at frequent intervals have, besides, become more stringent. A study of this situation on the system of the Detroit Edison Company led to the layout of the present meter laboratories and to the operating organization adopted for the meter department.

During the summer and early fall of 1922 the company moved its meter and installation departments into well-equipped quarters in its new service building, thereby bringing virtually all of the departments, including the administrative, under one roof. This change provided an opportunity to install more modern and efficient equipment, which, with the advantages gained by having related departments in close proximity, is producing correspondingly better results.

The meter installation work comes under the supervision of the sales department, whereas the other meter activities are included in the accounting group. This division is unusual, but in Detroit it has been a very satisfactory arrangement, owing to close co-operation between departments.

The Michigan Public Utilities Commission has recently prepared a very complete set of rules governing "Standards for Electrical Service," which deal very largely with meter practice and present probably the most advanced views on the subject. The Detroit company has always done rather intensive meter work, and compliance with the commission's rules will be practically a continuance of former policies. The requirement of ironclad services and inclosed service switches is a step forward and shows the trend of the times. The rules relative to intervals between periodic tests of watt-hour meters are well developed and reasonable. They are as follows:

*Periodic Tests.*—Each watt-hour meter shall be tested according to the following schedule while connected in its permanent position in place of service:

(a) Two-wire and three-wire commutating-type and mercury-type meters, up to and including 50 amp. rated capacity of meter element, at least once every twenty-four months.

(b) Two-wire and three-wire commutating-type and mercury-type of meters of more than 50 amp. and up to and including 500 amp. rated capacity of meter element, at least once every twelve months.

(c) Two-wire and three-wire commutating-type and mercury-type meters of more than 500 amp. rated capacity of meter element, at least once every six months.

(d) Two-wire and three-wire single-phase induction-type meters up to and including 25 amp. rated capacity of meter element, at least once every forty-eight months.

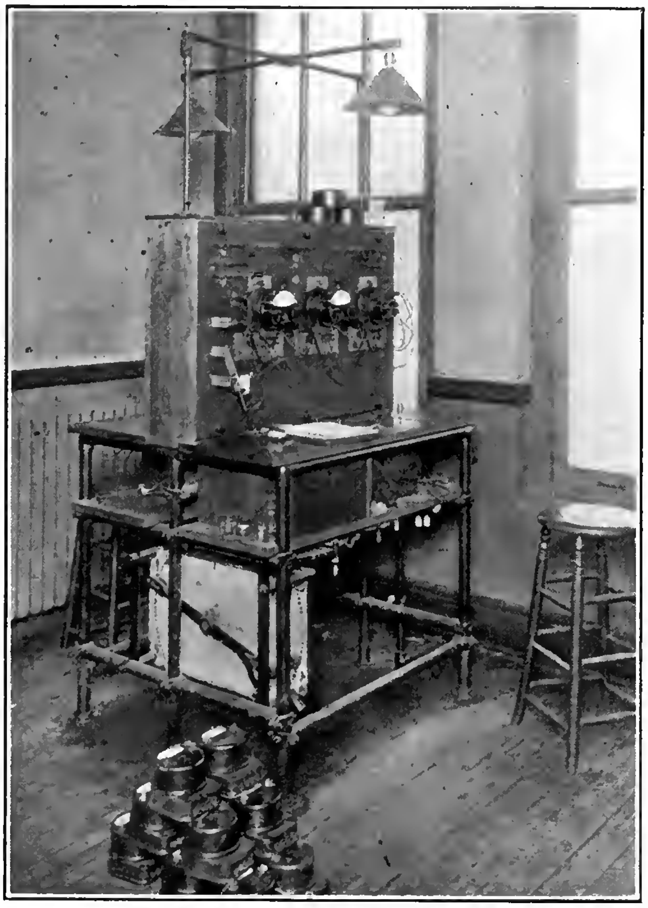
(e) Two-wire and three-wire single-phase induction-type meters of more than 25 amp. rated capacity of meter element, at least once every twenty-four months.

(f) All polyphase induction-type meters up to and including 50 kva. rated capacity of meter element, at least once every twenty-four months.

(g) All polyphase induction-type meters of more than 50 kva. rated capacity of meter element, at least once every twelve months.

### Divisional Organization Used

To take care of this testing work—there being 340,000 meters in service on the Detroit lines, of which approximately 100,000 meters are due for test this year—together with the keeping of records, purchases, etc., the meter department is divided into divisions, each one under a foreman who reports to the superintendent.



ALL TEST BENCHES AND SWITCHBOARDS WERE SPECIALLY DESIGNED AND BUILT IN THE COMPANY SHOPS —A DISTRICT OFFICE TEST BOARD

Thus, the "outside testing division" handles all service and complaint tests and furnishes periodical accuracy reports. The "meter laboratory" makes tests on all new meters received and all incoming meters returned from customers' services. The "standardizing laboratory" carries on special tests in addition to its function of certifying all standards and instruments. The "demand division" inspects and maintains demand meters in service and furnishes demand data for billing. This division also obtains load and utilization data for the steam-heating customers and reads the steam condensation meters. The "meter stock and records division" maintains the meter record files and acts as custodian.

The suburban district foremen, with headquarters in Ann Arbor, Mount Clemens and Port Huron, cities adjacent to Detroit, handle meter work in their territory.

There is also a steam division which handles the installation and maintenance of steam condensation meters, of which 2,000 are in service.

New meters and metering equipment are purchased by the purchasing department on orders placed and scheduled by the meter department. They are received and checked in by the stores department and turned over to the meter laboratory, where, after entries in the meter stock records have been made, they are put through the routine tests. Watt-hour meters and equipment are not carried in the general stores account, but in the meter account, chiefly because of the continual movement to and from service.

Meters removed from service are turned in to the meter stockroom by the installation department and from there delivered to the laboratory for the routine test before reinstallation. Thus every meter receives a test previous to installation regardless of its previous history. Single-phase meters are calibrated on 5 per cent and 75 per cent of rated capacity at unity power factor and at 75 per cent of rated current at 50 per cent power factor. Three-wire meters are also tested for balance of elements, and, if polyphase, each element is separately adjusted. Direct-current meters are calibrated at 10 per cent and 75 per cent of rated capacity, and, if three-wire, are tested for balance. In addition to these accuracy tests, each meter is examined for structural defects and its register is checked on a mechanical checker.

Alternating current is used in all tests except where mercury meters or heavy direct currents are involved. This alternating current is taken from small 220/11/22-volt transformers on each test board, each equipped with Ward-Leonard rheostats. Thus every board is a unit in itself.

The power supply for the laboratories is obtained from a transformer vault in the basement of the building. Here a 4,600-volt, 60-cycle, three-conductor cable is brought in from the adjoining substation, and after passing through an induction regulator controlled by a contact-making voltmeter the high-tension current is transformed in three banks of transformers to 110, 220 and 440 volts. The secondaries of these transformers are brought up to the main distributing switchboard in the meter laboratory, on which are mounted, in addition to the various feeder switches, a graphic voltmeter and the previously mentioned contact-making voltmeter. From this switchboard conduits under the floor carry feeders to a form of ring bus which is carried in a heavy conduit entirely around the laboratory walls, about two feet above the floor. Services to the various test boards are taken from this ring, so there is practically no visible wiring or piping. A compressed-air line follows the bus conduit, giving an air supply wherever needed. The air is passed through a condenser to remove any traces of moisture.

The 5-amp., 110-volt, single-phase meters, which form the greater part of the total, are tested on gang boards equipped with automatic connectors and taking nine meters on each side. This seems to be the maximum number that one man can properly handle at one time. Odd sizes of meters are tested on boards arranged for individual connections. The 10-amp., 120-volt direct-current meters are also tested on a special gang board.

In addition to its regular functions, the meter laboratory serves as training quarters for apprentice testers and inspectors. This training work is quite extensive and rather outside the province of this article.

A special installation of test boards is required for the calibration of Wright demand indicators, a considerable number of which are used on the Detroit

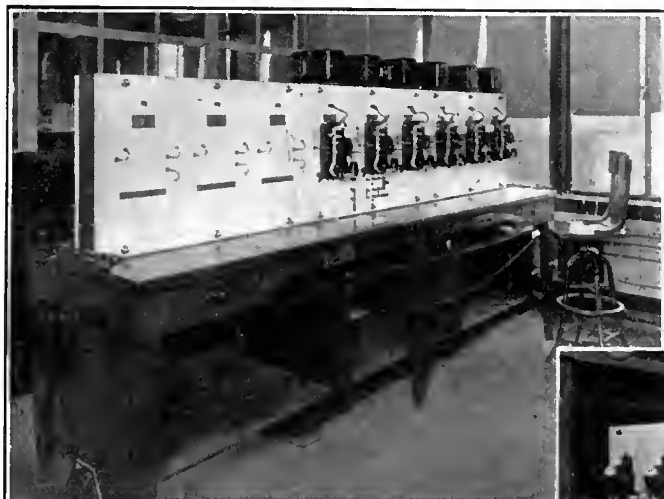
system. These indicators are installed on commercial lighting installations between certain limits of capacity. They are purchased with blank scales and calibrated in the laboratory according to the voltage upon which they are to be used. Testing current is supplied from a multiple-step auto-transformer controlled by a variable reactance coil.

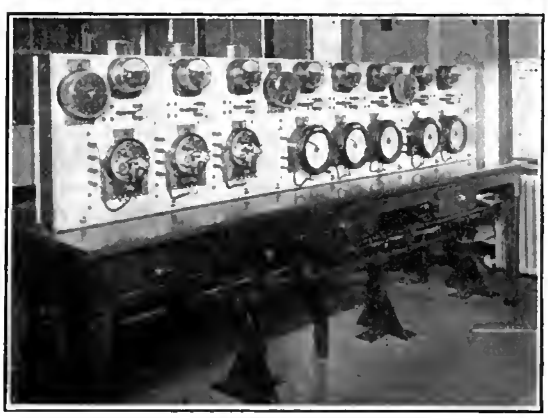
The integrating demand meters are tested and adjusted in a separate glassed-in room, under the care of experienced watch and clock experts. The meters receive a careful inspection and are then hung on the test board and put through a thorough test for timing and performance. The Detroit Edison system frequency is controlled by a Warren master clock, enabling most of the demand meters to be operated by Warren motors. The type C-4 contactor clocks are tested by connecting to small solenoids operating Veeder counters. These counters are locked in a closed compartment at the beginning of the test, and hence at the end of the run the actual number of clock contacts is definitely known. Time switches for use on two-rate metering installations are also cared for in this room.

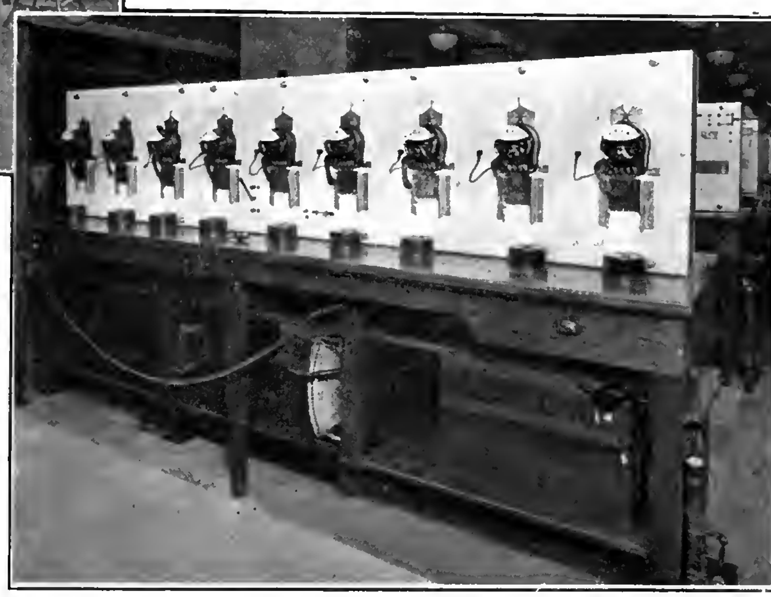
The repair shop is in the general shop building at some little distance from the service building, and meters and other instruments needing repairs or painting are delivered by trucks making regular scheduled trips. The shop was designed to permit of rapid work under agreeable conditions. Four two-man benches are installed, replacing the older arrangement of one long bench at which the men worked side by side. A paint spray outfit together with a buffing and grinding machine enables meters to be cleaned and painted at a very low cost. A substantial supply of repair parts for all meters insures against accumulation of "dead" stock.

The standardizing laboratory, which adjoins the meter laboratory in the service building, is a distinct division of the department and, as previously mentioned, maintains the primary and secondary electrical standards for the company and certifies all working standards, both indicating and rotating, used by the department. Here also are made acceptance tests on new types of metering devices, as well as special tests and investigations, chiefly along metering lines. Instrument transformers used in customers' installations receive the routine ratio and phase-angle tests here, every transformer being tested before installation or reinstallation, the Silsbee testing set being used for current and the Brooks method for voltage transformers. Tests on indicating instruments in the company's stations are made by men from the standardizing laboratory.

The primary standards include a standard clock with compensated mercury pendulum and regulated by Arlington time signal, a set of eight Weston standard cells, two potentiometers, one of which is a Leeds & Northrup type "K" and the other a Weston, and a set of standard resistors.







TOP, LEFT—A SPECIAL BOARD IN AN INCLOSED ROOM IS USED TO TEST INTEGRATING DEMAND METERS. AT RIGHT—NINE 5-AMP. METERS ARE HANDLED AT ONE TIME BY A TESTER. BOTTOM, LEFT—GANG TEST BOARD FOR 10-AMP. DIRECT-CURRENT METERS

For secondary standards there are Weston laboratory standard alternating-current and direct-current ammeters and voltmeters and Westinghouse and Weston standard dynamometer wattmeters. A Thompson double bridge and a precision Wheatstone bridge are also in use.

The working standards comprise a full line of ammeters, voltmeters and wattmeters, as well as the rotating standards in daily use. All of these instruments are periodically checked and certified through reference to the primary standards, which in turn are certified at stated intervals either by the Electrical Testing Laboratories or the Bureau of Standards.

Direct current for testing is supplied from a 300-volt, 0.75-amp. potential battery, a sixteen-cell, 14,560-amp.-hr. battery and a 700-volt, 10-kw. direct-current generator. Alternating current is supplied at the three

general voltages of 110, 220 and 440, and in addition to the small 220/11-volt transformer for individual testing positions there is a pair of 10-kva., 229/5½-volt transformers for heavy single-phase current.

Three-phase, three-wire or four-wire current at 16 volts up to 400 amp. is obtained from a specially connected I. R. T. regulator with bench control, subject to variation of power factor over a 360-deg. range. A bank of balanced carbon rheostats may be connected to this regulator.

Indirect lighting is used throughout the building. An intensity of 15 foot-candles is employed over the test boards, giving plenty of light with very slight shadows.

Within the Detroit city limits the company has established five district offices, and at four of these meter-testing boards and equipment are maintained to cooperate with the installation department in giving speedier service to customers. Meters are delivered from the meter stockroom direct to these offices and are taken out from there by the district installers. Incoming meters are then tested as they accumulate by men sent out periodically from the meter laboratory, and where no major repairs are required they are again available at the same office. This method is found to save considerable transportation of meters.

The suburban territory surrounding Detroit in a radius of about 60 miles is divided into nine districts, in three of which meter department branches are maintained. Each branch is equipped with a small test board, a repair bench, meter storage racks and card record files. The suburban foremen attend biweekly conferences with the department staff in Detroit and thereby keep their meter practice uniform. They are also visited at intervals by the superintendent and assistants.

# Analyzing Power Costs in Small Plants*

## An Investigation of the Various Factors that Are Involved—Use of Turbine and Oil Engines in Typical Installations—Influence of Load Factors on Selection of Prime Mover

By L. V. H. ARMSTRONG
*Engineer, Ingersoll-Rand Company*

IN ARRIVING at the cost of power at the switchboard of an electrical generating plant it is necessary to determine for the existing conditions (1) fixed or standing charges, (2) fuel cost, (3) labor cost, and (4) supply and repair charges. The total of these charges reduced to the kilowatt-hour cost at the switchboard is the determining factor in the choice of a prime mover.

The fixed charge against the power plant has been assumed to be 15 per cent of the initial investment made up as follows: Interest, 5 per cent; depreciation, 5 per cent; and obsolescence, 5 per cent.

In studying fixed charges it will be noted that the three factors affecting the fixed charge per kilowatt-hour are as follows:

1. Size of installation. The larger the plant, the lower the initial cost per rated kilowatt, and therefore for the same yearly load factor the fixed charge per kilowatt-hour will be lower.
2. Number of units into which power is divided. The greater the number of units, the higher the initial investment, and hence the higher the fixed charge per kilowatt-hour for the same yearly load factor.
3. Yearly load factor; that is, percentage of actual kilowatt-hours produced to rated kilowatt-hours. For a constant yearly fixed charge the greater the number of kilowatt-hours produced, the smaller will be the fixed charge per kilowatt-hour.

### Fuel Charge Varies

Fuel cost curves have been plotted on a nominal cost of 1 cent a gallon, making it simple to convert to actual fuel costs. In the same way, the fuel cost per kilowatt-hour for the steam plant is based on a nominal charge of $1 a ton for coal.

The fuel consumptions per brake-horsepower-hour used in plotting curves for the oil engines represent the average of guarantees submitted under bond at competitive biddings by a number of reputable manufacturers. A heating value for the fuel oil of 18,500 B.t.u. per pound has been used and a weight of 7½ lb. to the gallon.

For the steam plants the water rates of the turbines and boiler efficiencies have been obtained in the same way, by averaging the guarantees made by a number of manufacturers. A heating value of 13,000 B.t.u. per pound has been assumed for the coal and a weight of 2,000 lb. to the ton. Bituminous run-of-mine coal is the grade considered.

### Labor Charge Assumptions

The operating force required for the different plants and the salaries are assumed to be as follows:

For the two 100-kw. and one 200-kw. plants:

| STEAM Class of Employee | Monthly Salary | OIL ENGINE Class of Employee | Monthly Salary |
|---|---|---|---|
| One chief engineer | $150 | One chief engineer | $165 |
| Two watch engineers | 125 | Two watch engineers | 135 |
| Three firemen | 110 | | |

For the two 275-kw. and one 550-kw. plants:

| STEAM Class of Employee | Monthly Salary | OIL ENGINE Class of Employee | Monthly Salary |
|---|---|---|---|
| One chief engineer | $175 | One chief engineer | $190 |
| Three watch engineers | 125 | Three watch engineers | 135 |
| Three firemen | 110 | | |

These salaries are totaled and then reduced to an average hourly labor charge, assuming twenty-four hours to the day and 365 days to the year. Using these average labor charges, curves have been plotted for the different plants against hourly load factors.

It should be noted that nothing has been charged against the steam plant to cover handling coal or ashes. On the other hand it is generally believed that oil-

*Abstract of paper presented before the Atlanta Section, A. S. M. E.

engine operators are much more highly paid than steam-engine men. Supply and repair charges are combined and plotted as curves. Four per cent of the initial cost has been used for the oil engines, 3 per cent for the steam and 1 per cent for the electrical equipment. Only normal routine repairs, such as replacing boiler tubes, grates and brickwork, renewing steam piping and lagging, grinding and replacing valves, reboring cylinders, rebabbitting bearings, etc., are covered.

### Comparison of Plants Under Assumed Conditions

(a) The first condition to be considered will be a small municipal power plant with a peak load of approximately 100 kw., a small manufacturing power demand and a constant population during the twelve months of the year. In such a plant it would be necessary to have not less than two units, either of which would be of sufficient size to carry the peak load alone. On account of this standby unit, one may expect the fixed charge per kilowatt-hour to be high, and the burden laid on the plant by this standby unit will be directly proportional to the initial cost of the plant.

The load conditions prevailing during twenty-four hours are assumed to be in accordance with the following table:

| Kw. Load | Number of Hours | Time |
|---|---|---|
| 100 | 3 | 7 p.m. to 10 p.m. |
| 50 | 2 | 10 p.m. to midnight |
| 15 | 6 | Midnight to 6 a.m. |
| 20 | ½ | 6 a.m. to 6:30 a.m |
| 0 | 1 | 6:30 a.m. to 7:30 a.m. |
| 75 | 4½ | 7:30 a.m. to noon. |
| 15 | 1 | 12 noon to 1 p.m. |
| 75 | 4 | 1 p.m. to 5 p.m. |
| 20 | 2 | 5 p.m. to 7 p.m. |

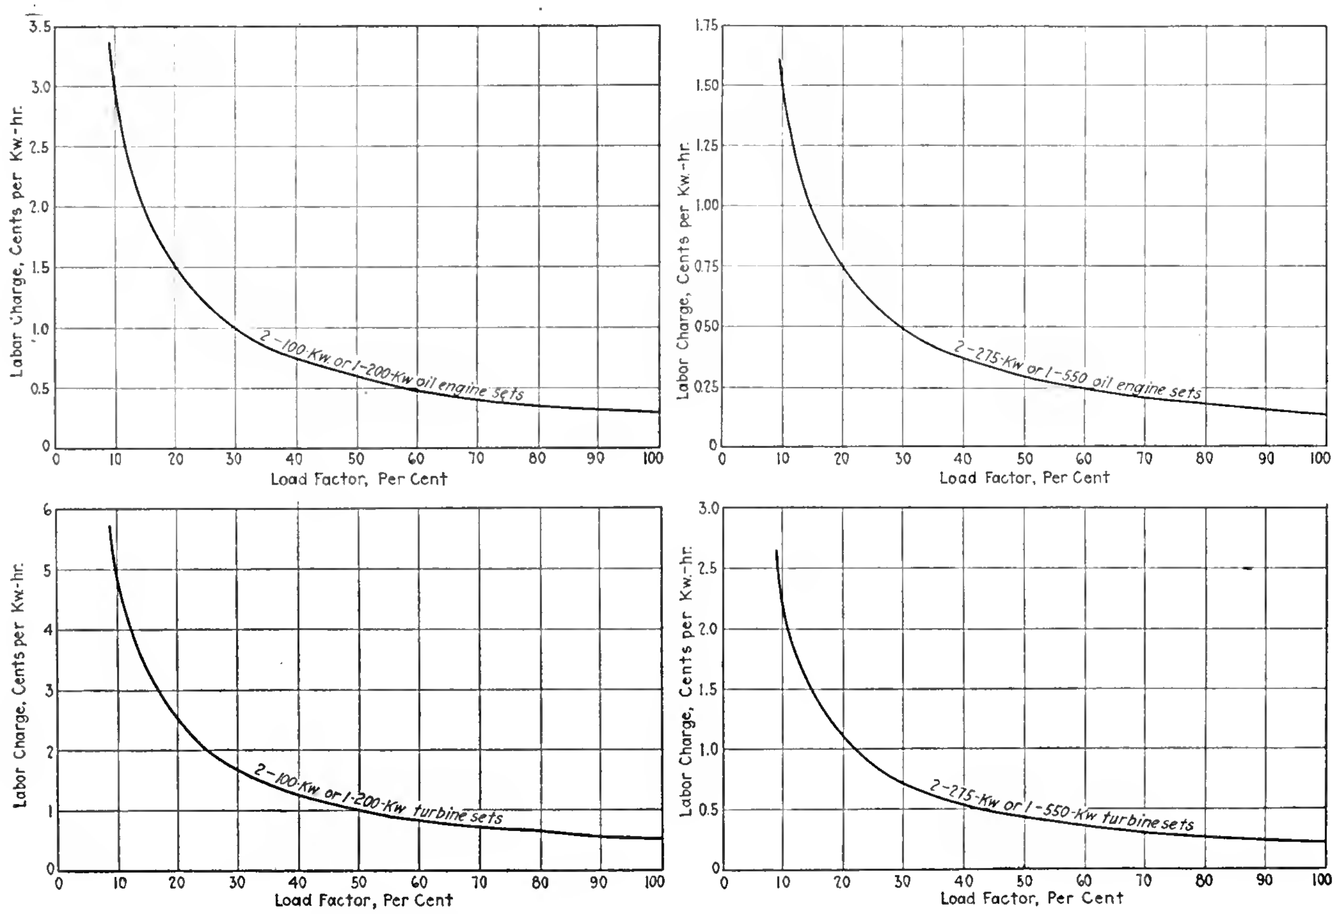
From the above it is found that the actual kilowatt-hours developed represents 25 per cent of the kilowatt-hours possible, both units operating. This load factor enables us to take from the curves the fixed charge, labor charge and supplies and repair charge per kilowatt-hour for the two-unit 100-kw. oil-engine plant. These charges are: Fixed charge, 1.5 cents; labor charge, 1.18 cents; supplies and repairs, 0.165 cent.

Then, assuming a price for fuel oil delivered at the plant of 5½ cents a gallon and using the hourly fuel costs at the loads given in the above table to arrive at an average hourly fuel cost for a period of twenty-four hours, a charge of 0.59 cent per kilowatt-hour for fuel is obtained. Totaling the above charges, one obtains an ultimate cost per kilowatt-hour of 3.435 cents.

With the same data, the following charges for the steam plant of a similar type and size result from the curves: Fixed charge, 1.45 cents; labor charge, 2 cents; supplies and repairs, 0.105 cent.

Assuming a cost per ton of coal delivered of $7, made up of $3.25 cost, f.o.b. mines, $3 freight and 75 cents for unloading and placing in bins, an average fuel charge per hour of 1.372 cents is found. Totaling the above charges, there results a final charge per kilowatt-hour of 4.927 cents.

This represents a saving in favor of the oil-engine plant of 1.49 cents per kilowatt-hour, or a yearly saving, based on the load factor assumed to obtain in this plant, of $6,540.



LABOR CHARGE IS LESS FOR THE OIL ENGINE SETS IN SIZES UP TO 550 KW.

In case it should be necessary to pay 11 cents per gallon for fuel instead of 5½ cents, the saving per kilowatt-hour in favor of the oil engine will become 0.9 cent instead of 1.49 cents and the yearly saving will be reduced from $6,540 to about $3,925. In other words, even with an abnormally high price for fuel oil, the oil-engine plant is still the better. It should be noted that in the calculation just made for the steam plant no allowance has been made for banking fires, cleaning fires or raising steam pressure to take care of the peak load. This will amount to a considerable item, as the best authority places the quantity of coal per boiler-horsepower necessary to bank fires at about ¼ lb. The oil-engine plant has no similar factor, as full power can be had in approximately two to three minutes from the starting up of the engine, and, in the same way, as soon as the demand for power ceases the oil engine can be stopped and simultaneously the fuel consumption stops.

(b) Let us now consider a larger town, with a peak power demand of 275 kw. and a power plant consisting of two units, either of them being of sufficient size to handle the

$6{,}600 \div (365 \times 24 \times 200) = \$0.00376$
50 per cent yearly plant load factor:
$0.00376 \div 0.50 = 0.0075$
10 per cent yearly plant load factor:
$0.00376 \div 0.10 = 0.0376$

**II. Fuel Charge.**

Per Kw.-Hr.

100 per cent and 50 per cent plant load factor (same—two engines, one engine):
$(150 \times 0.45 \times 0.01) \div (7.5 \times 100) = \$0.0009$
75 per cent plant load factor (75 per cent each engine):
$(0.0009 \times 0.47) \div 0.45 = 0.00094$
10 per cent plant load factor (20 per cent load one engine):
$(0.0009 \times 0.72) \div 0.45 = 0.00144$

**III. Labor Charge.**

$[165 + (2 \times 135) \times 12] \div (365 \times 24) = \$0.596$ (average hourly labor charge)

Per Kw.-Hr.

100 per cent plant load factor:
$0.595 \div 200 = \$0.00298$
50 per cent plant load factor:
$0.00298 \div 0.50 = 0.00596$
25 per cent plant load factor:
$0.00298 \div 0.25 = 0.0119$
etc.
(Labor charges same for single-unit 200-kw. plant.)

**IV. Supplies and Repairs.**

Hourly lubricating oil cost, one hour, one unit:
$(150 \times 0.60) \div 4{,}000 = \$0.0225$.
Hourly lubricating oil cost, one hour, two units:
$2 \times 0.0225 = 0.045$.
Yearly repair cost, one engine, 100 per cent time running:
$0.04 \times 12{,}420 = \$497$.
Yearly repair cost, two engines, 100 per cent time running:
$2 \times 497 = \$994$.
Yearly repair cost, one generator, 100 per cent running:
$0.01 \times 2{,}336 = \$23.50$.
Yearly repair cost, two generators, 100 per cent running:
$2 \times 23.50 = \$47$.
10 per cent plant load factor (20 per cent one unit):

$$\frac{497 + 23.50}{365 \times 24 \times 100 \times 0.20} + \frac{0.0225}{0.20 \times 100} = 0.0041.$$

25 per cent plant load factor (50 per cent one unit):
$(0.0041 \times 0.20) \div 0.50 = 0.00164$.
50 per cent plant load factor (100 per cent one unit):
$(0.00164 \times 0.50) \div 1.00 = 0.00082$.
75 per cent plant load factor (75 per cent both units):
$(0.00082 \times 4) \div 3 = 0.00109$.

peak demand. The fact that the units are larger will reduce the initial cost of the installation per kilowatt and also improve the fuel consumption per kilowatt-hour. As this increase in the size of the plant would not necessitate any material change in the operating force, the labor charge per kilowatt-hour will also be less on account of the fact that more kilowatt-hours are produced. From the curves the following charges are obtained for the oil-engine plant: Fixed charge, 1.10 cents; labor charge, 0.59 cent; repairs and supply charge, 0.14 cent.

Assuming again a cost for fuel oil of 5½ cents a gallon, the fuel cost per kilowatt-hour is found to be 0.538 cent. Totaling the above charge, an ultimate cost per kilowatt-hour of 2.37 cents results.

In the same way, for the steam plant, these charges are obtained from the curves: Fixed charge, 0.85 cent; labor charge, 0.87 cent; supplies and repairs, 0.065 cent.

Assuming a cost of $7 per ton for coal laid down at plant, a fuel charge of 1.13 cents is obtained. Totaling the above charges, the ultimate cost for power delivered is found to be 2.92 cents per kilowatt-hour. In other words, there would be a saving in favor of the oil engine plant of 0.55 cent per kilowatt-hour, which in a year would represent $6,650.

For a plant of the size just described a better installation would consist of three 150-kw. units or four 100-kw. units. Such a plant, instead of having a 100 per cent standby capacity, would have a 50 per cent and a 33⅓ per cent standby capacity. With any one of the units out the remaining units would be able to carry the peak load. The initial cost per kilowatt for the plants with the three and four units would be slightly higher on account of the units being smaller, but inasmuch as the standby capacity is less, the total cost for the installation would be less, and, therefore, the yearly fixed charge would be less. In the case of the oil-engine plant with three or four units the fuel consumption per kilowatt-hour would also be less, inasmuch as it

TABLE II—DETAILED ANALYSIS OF COST ESTIMATES
200-kw. Steam Plant (two units)

**I. Cost of Initial Installation, $43,000.**

Two 100-kw. turbo-generating sets.
Two generator panels.
Two 86-b.hp. water-tube boilers.
Setting of boilers.
Low-level multi-jet condenser and pumps.
Feed-water heater.
Boiler-feed pump.
All piping and fitting.
110-in. steel stack and flues.
Foundations.
Handling and placing on foundations.
Erector, thirty days at $20 per day.
Common labor, four men, $4 per day, thirty days.
Brick building (28 ft. x 16 ft. x 20 ft. + 24 × 24 at 32 cents per cubic foot).

Interest, depreciation and obsolescence .................... 0.15

Yearly fixed charge ....... $6,450

Per Kw.-Hr.

100 per cent plant load factor:
$6{,}450 \div (365 \times 24 \times 200) = \$0.00368$
75 per cent plant load factor:
$0.00368 \div 0.75 = 0.0049$
50 per cent plant load factor:
$0.00368 \div 0.50 = 0.00736$
25 per cent plant load factor:
$0.00368 \div 0.25 = 0.0147$

**II. Fuel Charge.**

Water rates: 24.4 lb., 27 lb., 30.8 lb., 38 lb. (13,000 B.t.u. coal, 70 per cent boiler efficiency).
Coal consumption: 3.12 lb., 3.45 lb., 3.93 lb., 4.85 lb. per kw.-hr.

Per Kw.-Hr.

100 per cent plant load factor (100 per cent both units):
$(3.12 \times 1.00) \div 2{,}000 = \$0.00156$
75 per cent plant load factor (75 per cent both units):
$(3.45 \times 1.00) \div 2{,}000 = 0.00173$
50 per cent plant load factor (100 per cent one unit): Same as above
25 per cent plant load factor (50 per cent one unit):
$(3.93 \times 1.00) \div 2{,}000 = 0.00197$

**III. Labor Charge.**

Hourly labor charge $= [150 + (2 \times 125) + (3 \times 110) \times 12] \div (365 \times 24) = \$1.00$
100 per cent plant load factor:

Per Kw.-Hr.

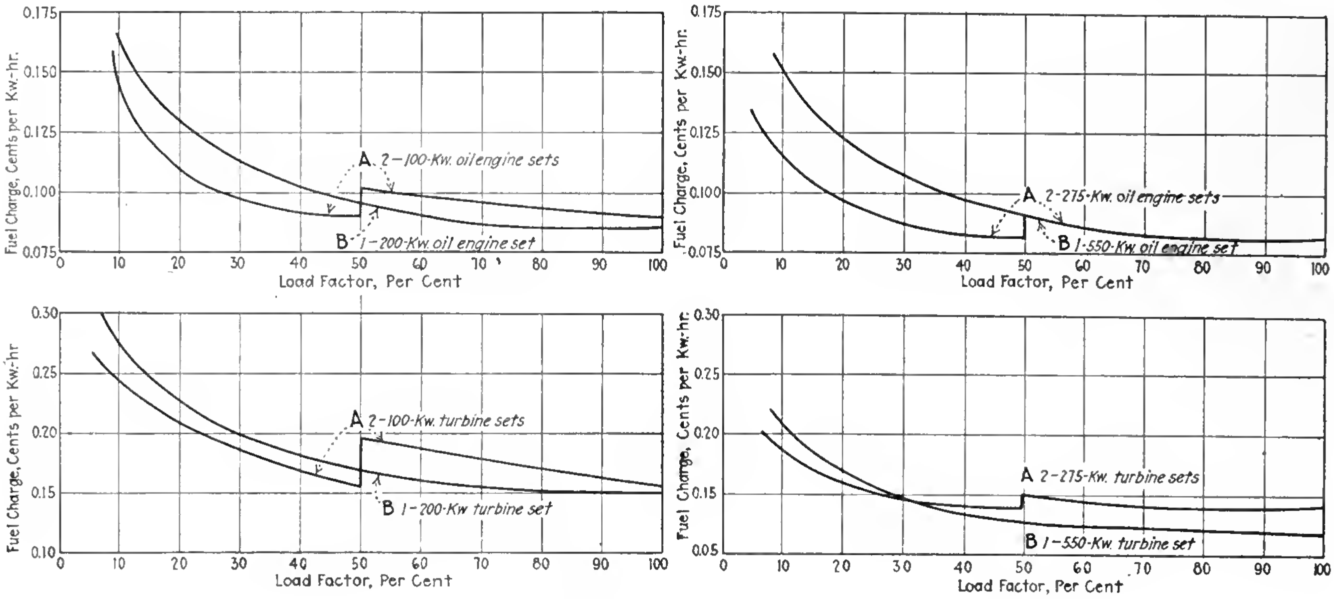
$1.00 \div 200 = \$0.005$
75 per cent plant load factor:
$0.005 \div 0.75 = 0.0067$
50 per cent plant load factor:
$0.005 \div 0.50 = 0.010$
25 per cent plant load factor:
$0.005 \div 0.25 = 0.020$

**IV. Repairs and Supplies**

Yearly repairs, both units running: $0.03 \times \$30{,}385 = \$911.55$
Yearly repairs, one unit running: $0.03 \times \$15{,}192 = \$455.76$
10 per cent plant load factor (20 per cent, one unit):

Per Kw.-Hr.

$456 \div (365 \times 24 \times 0.20 \times 100) = \$0.0026$
25 per cent plant load factor (50 per cent, one unit):
$(0.0026 \times 0.20) \div 0.50 = 0.00104$
50 per cent plant load factor (100 per cent, one unit):
$0.00104 \div 0.50 = 0.00052$
75 per cent plant load factor (75 per cent, both units):
$0.00052 \div 0.75 = 0.00069$



FUEL CHARGES ARE LESS ON THE OIL ENGINE SETS

would be possible to operate a smaller machine during the periods of very light load. The labor charge and the supplies and repairs charge would not be affected by the change in the composition of the plant.

(c) Let us next consider an industrial plant operating six days a week, ten hours to each operating day. It will be assumed that the average load during the operating day is 70 per cent of the power plant's rated capacity. On the basis of these figures, the actual kilowatt-hours developed would represent about 25 per cent of the total kilowatt-hours possible during the year. For such a plant it would be unnecessary to consider any standby capacity, and a power plant consisting of one unit would fill all the requirements. From the curves for the oil-engine installation it is found that the following charges are effective under the operating conditions just described for a power plant of 200 kw. rated capacity: Fixed charge, 1.325 cents; labor charge, 0.4 cent; supplies and repairs, 0.1 cent.

Assuming a cost of 5½ cents a gallon for fuel oil, the fuel charge per kilowatt-hour is 0.478 cent. Totaling the above charges, the ultimate charge per kilowatt-hour for the oil-engine plant is found to be 2.30 cents.

In the same way, for the steam plant, one obtains from the curves the following charges for a single-unit plant of 200-kw. capacity: Fixed charge, 1.175 cents; labor charge, 0.725 cent; supplies and repairs, 0.058 cent.

Using a price of $7 per ton for coal, a fuel cost per kilowatt-hour of 1.085 cents is obtained. Totaling the above charges, one gets an ultimate cost for the steam plant of 3.04 cents, or, in other words, a saving of 0.74 cent per kilowatt-hour in favor of the oil-engine plant. On the basis of the total number of kilowatt-hours produced in a year under the conditions just given, this would represent a yearly saving of $3,232.

(d) Now, let us consider an industrial plant operating under the same conditions but with a rated capacity of 500 kw. in a single unit. For the oil-engine installation, from the curves, one obtains the following charges: Fixed charge, 1 cent; labor charge, 0.206 cent; supplies and repairs, 0.092 cent.

Assuming a fuel cost of 5½ cents a gallon, one obtains a fuel charge of 0.465 cent. Totaling the above, 1.76 cents per kilowatt-hour is obtained.

In the same way, for the steam plant of the same size, from the curves one obtains the following: Fixed charge, 0.69 cent; labor charge, 0.30 cent; supplies and repairs, 0.036 cent.

Assuming a price of $7 per ton for coal, one obtains a fuel cost of 0.865 cent. Totaling the above charges, one gets a total charge per kilowatt-hour for the steam plant of 1.89 cents.

(e) Now, consider an industrial plant operating six days a week, twenty-four hours a day. In such a plant two units might be considered desirable, although it is believed that one unit will meet the requirements with complete success. The shutdown from Saturday night until Monday morning gives ample opportunity for overhaul, adjustment and repairs.

Let us consider such a plant with one unit of 200 kw. rated capacity and with an operating load factor of about 70 per cent. In the same way as previously described for the oil-engine plant, the following charges are found: Fixed charge, 0.525 cent; labor charge, 0.4 cent; supplies and repairs, 0.1 cent; fuel charge, 0.478 cent. Totaling the above charge, an ultimate fixed cost per kilowatt-hour of 1.50 cents is derived.

For the steam plant of similar size and composition, the following charges exist: Fixed charge, 0.45 cent; labor charge, 0.725 cent; supplies and repairs, 0.058 cent; fuel charge, 1.085 cents. Totaling the above charge, a cost per kilowatt-hour of 2.32 cents for the steam plant is obtained.

(f) Next consider an industrial power plant with a single unit of 550 kw. capacity and operating on the same load factor. For such an oil-engine plant the charges would be as follows: Fixed charge, 0.397 cent; fuel charge, 0.456 cent; labor charge, 0.206 cent; supplies and repairs, 0.09 cent. Totaling the above, one gets an ultimate charge per kilowatt-hour of 1.15 cents.

For the steam plant of similar size and characteristics the following charges are obtained: Standing charge, 0.29 cent; fuel charge, 0.865 cent; labor charge, 0.3 cent; supplies and repairs, 0.036 cent. Totaling these charges, there is found to be an ultimate charge per kilowatt-hour of 1.49 cents.

## Intense Construction Activities by Central Stations in Norway

During the year 1922 fifty-two new stations were installed in the districts of More, Sogn og Fjordene and Hovdaland, in Norway. There are 664 power stations, with a total generating capacity of 279,855 kw., in this district at the present time. Supplies for these stations are imported from Germany, Sweden, England and the United States. Equipment is also manufactured locally at the Norwegian plants of German companies and of one American concern. Although German houses have been dominant in this trade, the situation has so changed recently that at the present time there appears to be an excellent opportunity for American equipment manufacturers to secure a good share of the business.

Electrification of railroads also is making progress in Norway, the Ofot line being about to go into operation. It runs from Narvik, on the Arctic Ocean, to the Swedish border, where it joins the Swedish line to Lulea, on the Gulf of Bothnia, giving an all-electric line from the Arctic to the North Baltic.

STREET LIGHTING AT MIAMI BEACH, FLA., WHERE PROPER SUPERVISION AND MAINTENANCE ARE ENFORCED

# City Zoning of Street Lighting

## Improvements in Public Illumination Should Be Carried Out Under Comprehensive Programs Co-ordinated with and Included in City Zoning Plans—Central Stations Are Logical Sponsors

By CHARLES J. STAHL
*Manager Illuminating Bureau, Westinghouse Electric & Manufacturing Company, South Bend, Ind.*

IN DESIGNING ornamental street-lighting installations the most important consideration is to obtain efficient illumination at low operating and maintenance costs. The original cost of a street-lighting installation is seldom greater than its cost of operation over a two-year period. Most installations last from ten to fifteen years, so it is plain that a little saved or a little more spent on the original installation becomes an insignificant consideration when compared with the importance of wise planning from the standpoint of maintenance and operation costs.

In past years the usual practice has been to confine street-lighting improvements to limited sections. Just as city planning has in the past been almost wholly confined to scattering about the city a few beauty spots such as civic centers, parks and playgrounds, so has street lighting been scattered through the agency of localized improvements carried out as private developments or in the form of improvement districts. Nearly always the aim has been to boom a restricted area to commercial leadership through the establishment of "white ways." The work of so-called improvement districts may be made valuable if regulated under a general improvement plan; but without centralized leadership the result is haphazard patchwork.

There are several causes for this "spotty" development in street lighting. One is the failure of the public in the past to realize and appreciate the importance of good lighting to the community. But the public is not wholly to blame, for there has been little consistent advertising of the advantages thus to be derived. Central-station companies' sales departments are the logical advocates, but they seldom act in that capacity, and often an air of mystery and of sensitive political complications seems to surround the street-lighting contract. In obtaining franchise renewals and in overcoming the propaganda of politicians trying to ride into office on a campaign aimed against public utilities, central-station companies are often unjustly forced to use the street-lighting contract as a sedative. Consequently such contracts are often taken at a loss to the central station, and naturally no effort is subsequently made for a growth in unprofitable load. Furthermore, to keep the street-lighting loss as low as possible, the equipment is neglected and fails to operate at normal efficiency.

City administrations usually aim to keep a record of outages in order to collect penalties imposed under the terms of the street-lighting contract, but "semi-outages" usually pass unobserved.

### USUAL CRITICISMS OF STREET LIGHTING AND THE REMEDY

The average run of street lighting throughout the United States is more or less subject to the following criticisms which are given approximately in the order of their relative importance:

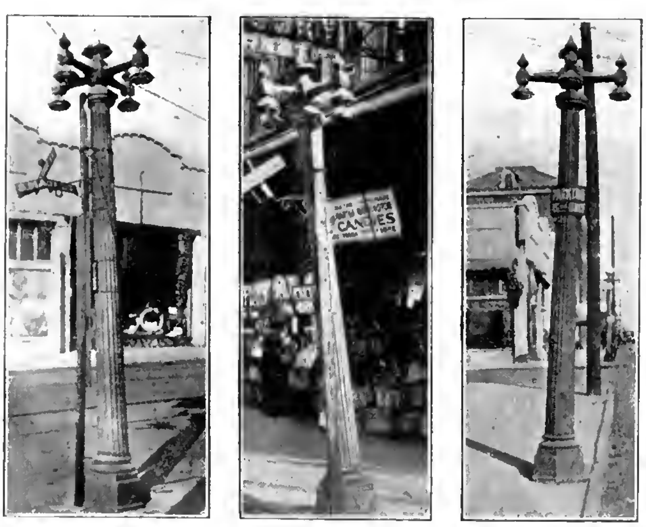
1. Inadequate illumination.
2. Miscellaneous growth without a definite relationship to a comprehensive city plan.
3. Inconsistent transitions and gaps in passing from one section to another.

AN EXCELLENT INSTALLATION OF LIGHTING ON McELMORE AVENUE VIADUCT, MEMPHIS, TENN.

4. A lack of standardization.
5. A lack in classifying streets and no unity of treatment for streets of the same classifications.
6. Too many unsightly or disfigured streets because of insufficient attention to architectural grace and ornamentation.
7. Too much temporary construction instead of building for flexible permanence.
8. Too little application of correlated intelligent effort, research and talent.

Without taking space to elaborate on the foregoing negative considerations, it is better to advance to the positive or constructive side of the question by establishing a definite set of rules, here offered as a guide to correct procedure in the design of ornamental street-lighting installations:

1. The justifiable expenditure for street lighting (construction plus operation and maintenance) may be graded according to traffic density.
2. Except in the rare case of uniformly loaded through arteries, intensities of illumination on streets of uniform character may be graduated as traffic streams split and thin out.
3. On purely residential side streets carrying little traffic except that originating from abutting residences intensities and types of lighting may be chosen primarily from the standpoints of crime prevention and of ornamentation.
4. On streets carrying slow-moving heavy traffic, such as trucking and freight-station business, moderate intensities of illumination are acceptable, but not by means of unsightly overhead construction.
5. On the streets having little traffic and low property values moderate intensities of illumination must nevertheless be maintained for the prevention of crime and unsightly overhead construction should be avoided.
6. Statistics on the increasing popularity of good lighting and the decreasing cost of electric power show a definite trend upon which fairly precise allowance may be based to provide capacity and flexibility for future improvement and intensification.
7. The practice of extinguishing a portion of the lights at about midnight is hazardous, complicated and seldom justified except on streets where very high values of illumination exist and where traffic is practically nil during certain hours.
8. The so-called "moonlight schedule" is obsolete and should have no consideration.
9. All street-lighting design and construction can and should be developed on a scientific basis correlated with the city zoning plan, dealing with the future of unimproved areas as well as the immediate requirements.
10. It is logical to have a somewhat higher illumination at intersections than at midway points.



THE USUAL RESULTS OF LOCALIZED IMPROVEMENTS, WHICH AS A RULE ARE CARELESSLY OPERATED AND MAINTAINED AND SOON BECOME DERELICTS

The construction of the underground portion of an ornamental street-lighting system may often be timed to coincide with repairs or reconstruction in paving, sewers or water and gas mains. One can appreciate what the results would be if an office building were to be constructed by employing workmen of the different crafts and permitting each to proceed according to his own ideas, yet this is in a large measure the procedure followed in the building of our cities. Most communities have plans, but too many lack a comprehensive plan to associate and correlate in their relative importance the individual plans of the different municipal departments, which usually follow a fragmentary development based largely on guesswork instead of on a scientifically derived analysis and forecast.

Putting into effect the practice of designing street-lighting systems along with zoning or expansion plans permits standardization, simplified supervision, reduced maintenance costs and the most efficient arrangement for transmitting energy to centers of distribution. The

longer we delay in working out a comprehensive foresighted and farsighted street-lighting plan comprising the entire area within the city limits and such areas as are likely to be annexed, the greater will be the loss in tearing down and reconstructing. Without such a plan one thing is sure, and that is that piecemeal plans are certain to be uncertain and unsatisfactory.

### Planning a Specific Case

In order to discuss the subject more in detail, suppose there is before those concerned the plat of a city of more than 100,000 population; say Indianapolis, where a short time ago a zoning ordinance was passed by the Council crowning a year's work of the City Planning Commission. On the plat it is easy to outline the intensified business section. It can be called Lighting Zone A, and one can proceed to make up Zone A specifications. These specifications need not call for an immediate remodeling of the lighting. Although it may be found inadequate according to the advanced standards of today, there is another consideration of equal importance, and that is that in all study and planning there should be a comprehension of what the requirements are likely to be ten years hence.

Usually more than half of the cost of ornamental street lighting is in the underground construction, and it is this portion of the work that should be made flexible and adapted to fit future developments and higher intensities without extensive reconstruction. Zone A specifications should, of course, call for the best of ornamental street-lighting equipment. Traffic, both vehicular and pedestrian, is dense, which means that property has a high valuation in comparison with which the street-lighting cost becomes an insignificant figure.

Number one of the foregoing rules states that the justifiable expenditure for street lighting may be graded according to the traffic density. One's first impression may be that it should be graded according to property values, and there is in fact no reason why the property instead of the traffic consideration may not be applied, for property values are created by and are directly proportional to the traffic.

In continuing the study of the plat certain main arteries of traffic are found. They may run east and

THE BEAUTY OF CIVIC CENTERS IS ACCENTUATED BY THE INSTALLATION OF APPROPRIATE LIGHTING EQUIPMENT (GRANT PARK, CHICAGO)

west and north and south, or they may be radial or a combination of all.

The point is that they are the main members of the framework upon which the city is built and is to continue its growth. In most cities heavy trucking is allowed on these arteries, but others are regarded more as passenger express routes with right-of-way over the contributing cross streets. At any rate, a liberal quantity and good quality of illumination should be applied to expedite and safeguard this traffic, in which the possibilities for misjudgment must be eliminated as far as possible. The same considerations may be extended to the use of the roadways by the Fire Department's equipment and to police supervision, detection and pursuit. Units should be mounted fairly high and glare reduced to the minimum. The selection of these streets falling within the area covered by lighting specifications for Zone A is, of course, provided for, and thenceforth specifications for Zone B apply.

A description of the particular characteristics of the various types of street-lighting equipment now available would become complicated and possibly tiresome. Correct selection of equipment can readily be made after a comprehensive plan is established, so it is not necessary

A COMPREHENSIVE STREET-LIGHTING PLAN HAS BEEN CARRIED OUT AT LIMA, OHIO, UNDER CAREFUL MANAGEMENT AND TECHNICAL TALENT

to consider details of the individual zoning specifications, but simply to outline the principal results that each is to produce.

### Contemplating Changes in Lighting Requirements and Standards of Construction

In predicting the requirements of the future it will perhaps never be possible to reach perfection. No one can expect his forecasts to be 100 per cent correct, and some replacement problems are bound to arise. Advance planning has the advantage of reducing them to the minimum. The intensive business section will expand, and parts of Zone B will merge into the Zone A district; therefore provision must be made so that parts or all of Zone B lighting may with a minimum of reconstruction be converted into Zone A lighting, and this is the very condition that makes a comprehensive plan beneficial and indispensable.

Flexibility is obtained by making such provisions in the underground network of electrical circuits that it becomes possible to make substitutions in the lighting units. Then as units in Zone B are replaced they are not lost but become available for growth in the extremities of that zone. In other words, it becomes possible to transplant without disturbing the roots. The most essential provision is an adequate system of underground conductors forming a network in which, as in the case of the streets, there must be high-tension main arteries, intersections and low-tension branches, in order that the electrical energy, like the traffic, may circulate expeditiously.

Few civic administrations realize the full gravity of the problems of distribution which often confront the management of a central-station company serving a city without definite community plans which would be an aid in forecasting the trend of developments and also the city's future requirements.

TENDENCY TOWARD HIGH MOUNTING (NEWARK, OHIO)

Returning to the plat, several different districts could be outlined, each requiring a different type of equipment as far as the portion above the ground is concerned. A third specification would be necessary for secondary business streets; a fourth for the manufacturing and wholesaling districts; a fifth for parks, playgrounds, civic centers, boulevards and other areas for recreational purposes. A sixth becomes necessary under some of the most modern city plans, which contemplate the elimination of grade crossings where cross streets intersect boulevards. In such an arrangement either the boulevard or the cross street becomes for a short distance a viaduct or a subway. In either case special treatment is required in order to obtain effective illumination.

A seventh specification is required for alleys in business sections and an eighth for alleys in outlying sections. However, all of these specifications can have many features in common. As a result the variety of articles to be carried in stock is substantially reduced, and prompt repairs are made possible with a minimum of "standby" material in the warehouse and a corresponding reduction in the inactive investment.

Aërial traffic, including night flying, is no longer to be disregarded, so another specification covering the lighting of landing fields, depots and hangers may be required in the near future. Some cities also have use for a similar specification for the floodlighting of municipal bathing beaches. So, under a set of from twelve to fourteen standardized types of lighting, all having numerous features in common, the varied lighting requirements of a large city can be economically provided. It is interesting to contrast the results of such simplification with the conditions now existing in many American cities. For example, in a Western city of 250,000 population there are forty-seven separate and distinct types of lighting, with a complete lack of interchangeability and with no logical associations or relationships. A better effect could be obtained with no more than ten types properly applied, and great economy in supervision, maintenance and operating costs could be brought about.

Fortunately, in some localities city planning is being broadened into regional planning; in other words, coöperative planning between communities is being advocated and in a few localities is already being practiced. From the illuminating engineer's standpoint the idea should be encouraged, for the lighting of interurban highways is already an important consideration under the good roads movement. Tourists do not select a route because the streets of a certain city on that route are well paved and lighted. Their choice is based on the average character of the route throughout. In this and many other ways the success of almost every city depends in some measure upon the activities of the neighboring cities.

The immense volume of high-speed traffic brought about by the use of automobiles has caused an enormous increase in traffic accidents. A careful study based on accident statistics from thirty-two cities shows that 17.8 per cent of all night traffic accidents are due to inadequate illumination. Evaluated, this represents an annual property loss of at least $54,000,000 in addition to human misery, loss of life and enforced care of dependents and those permanently disabled. On the other hand, according to census reports, the total expenditure for street lighting in the United States does not exceed $50,000,000 per year.

### Adequate Street Lighting a Solution of Headlight Problem

Good street lighting is a great benefit to automobile drivers, whose vision after dark depends upon the fairly constant and uniform illumination from the street lights and the spasmodic, violent influence of approaching automobile headlights. Although the average street illumination throughout the country is inadequate, the greatest danger, excepting grade crossings, is in glaring

automobile headlights, and with the continual growth in automobile traffic it is becoming evident that some solution of the headlight problem must be brought out. There are at least two possible solutions, namely:

1. The establishment of one-way streets and interurban or trunk highways.

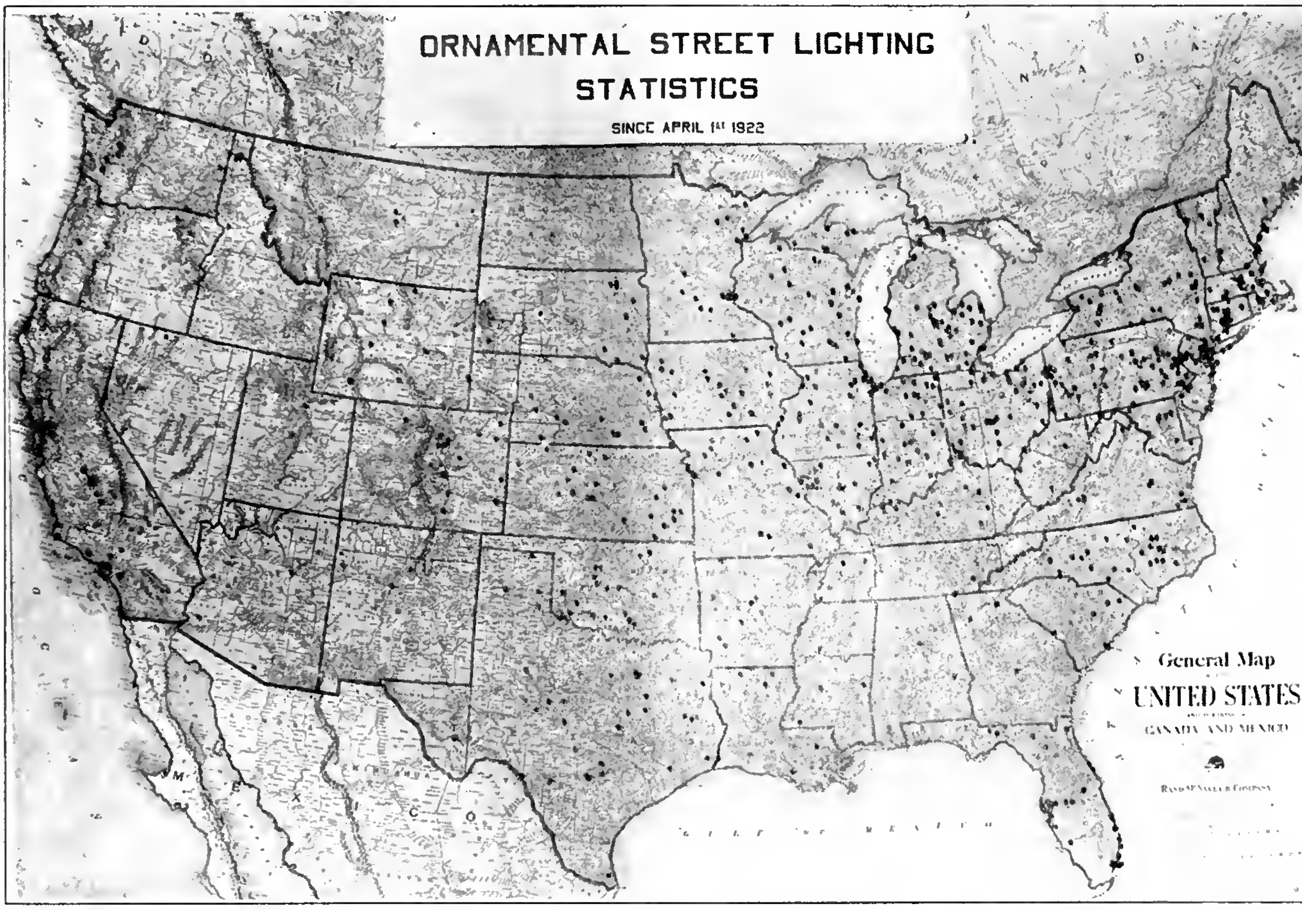
2. The lighting of trunk highways so that with dimmed headlights cars may be operated with safety and in comfort at the customary cross-country speeds.

Efficient highway-lighting fixtures have been developed, and their use is being advocated by the leading manufacturers of street-lighting equipment and has been sponsored by the Illuminating Engineering Society after considerable study and experiment.

The cost of lighting a highway does not exceed 5 per cent of the cost of duplicating the highway in order to provide for one-way traffic, so it is obvious that the second method is more economical than the first.

Many states have put into effect very definite regulations requiring the use of improved headlight lenses, governing their adjustment and various other details. Some have employed illuminating engineers and maintained a substantial force of traffic officers especially trained to insure competency in enforcing the headlight rules, but the success attendant on the most conscientious and persistent supervision has been small and unstable. The solution lies in supplying such illumination on the main highways that drivers will not need their headlights except perhaps as markers to define the width of the car or the limits of the area to be avoided in passing, and on city streets to make the approach of automobiles readily apparent to the persons who may be crossing a street.

So far obsolescense has not been mentioned. However, it presents no serious difficulties except to cities possessing extensive arc-lighting systems. Most Mazda lighting units are adaptable to whatever changes may take place in the design of lamps and glassware, so a further development in the Mazda lamp will in all probability only necessitate corresponding adjustments already provided for in the construction of modern fixtures.

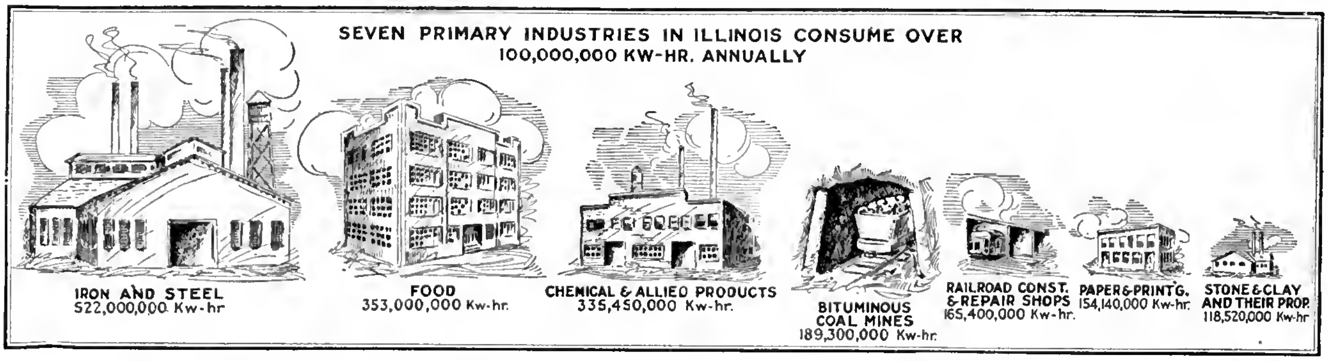


CITIES NOW ACTIVELY NEGOTIATING FOR ADDITIONAL ORNAMENTAL STREET-LIGHTING EQUIPMENT, EITHER FOR EXTENSION OR FOR REMODELING OF OBSOLETE INSTALLATIONS

A scientifically derived, comprehensive and farsighted street-lighting program correlated with a city zoning plan is not easily worked out. It calls for specialized talent in many lines of work, and in most cases city officials can profit by bringing into consultation the engineers found in the organizations of public utility companies, whose success depends largely upon their ability to foresee future requirements and to meet them with a minimum loss in reconstruction. This nation is becoming possessed of many vast cities, and most of them have in the past been more or less like "Topsy"—they just grew. Our large industrial establishments and other privately owned projects exemplify the economy of employing talented engineers and architects. The city is, of course, more important than any of its contributing factors, yet there is in most large industrial companies an array of engineering talent, with well-thought-out policies on research and development, that is rarely found among the entire personnel of the average city's administrative body.

# Industrial Energy Consumption in Illinois

**Almost Half of the 2,345,173,000-Kw.-Hr. Consumed by the Industrial Plants and Mines of Illinois in 1920 Was Generated in Central Stations—Iron and Steel Industry Leads in Energy Consumption**



THE IRON AND STEEL MILLS OF ILLINOIS FAR OUTSTRIP ANY OTHER INDUSTRY OF THAT STATE IN THE ANNUAL CONSUMPTION OF ELECTRICAL ENERGY

DURING the past four years the ELECTRICAL WORLD has conducted a country-wide survey to ascertain the extent to which electrical energy is being used by the various industries. The survey has been undertaken by states, and Illinois is the seventeenth state in the series.

The total consumption of electrical energy by the mills, factories and mines of Illinois during 1920 is estimated at 2,345,173,000 kw.-hr., of which 1,224,961,000 kw.-hr. was generated in private stations of the plants and mines. It is estimated that 3,424 generators were installed in private generating plants, with a total rating of 731,971 kw., of which machines rated at 295,333 kw. are direct-current generators. By far the largest user of electrical energy in Illinois is the iron and steel industry, which in 1920 consumed 522,000,000 kw.-hr., or 22.2 per cent of the total electrical energy consumed for power purposes by the plants and mines of that state. The food products industry is second, with a total consumption of 353,000,000 kw.-hr. in 1920. The extent to which operations in the iron and steel industry were curtailed during the late industrial depression is indicated by the large decrease in the amount of electrical energy consumed in 1921 as compared with 1920, as shown in Table I.

It is estimated that there are 111,692 electric motors installed in the factories and mines of Illinois, with a total rating of 1,353,965 hp. Of these motors 45,267, or 40.6 per cent, are under 5 hp. About 56.7 per cent of the machines are belt-driven, 37.3 per cent are directly connected, and only 6 per cent are chain-driven.

The returns indicate that eighteen voltages are in use

**Table I—"Electrical World" Estimate of the Use of Electrical Energy by the Industrial Plants of Illinois in 1920 and 1921**

| | Electric Generators (In Private Plants) | | | | Electrical Energy Consumed | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct-Current | | Alternating-Current | | | | | |
| Industry | No. | Total Rating, Kw. | No. | Total Rating, Kw. | Purchased from Public Utilities 1920, Kw.-Hr. | Generated in Private Plants 1920, Kw.-Hr. | Total Energy Consumed 1920, Kw.-Hr. | Total Energy Consumed 1921, Kw.-Hr. |
| Agricultural implements | 39 | 7,930 | 12 | 9,790 | 35,000,000 | 41,100,000 | 76,100,000 | 34,200,000 |

in Illinois by mines and factories for the operation of direct-current motors and that seventeen voltages are used in the operation of alternating-current motors. It appears that about 54.1 per cent of the direct-current motors are operated at 220 volts, but a large percentage are also operated at 110, 230 and 250 volts. Iron and steel mills particularly report a high percentage of direct-current motors operated at other than 220 volts. More than two-thirds of the alternating-current motors are operated at 220 volts, and about one-fifth are operated at 440 volts. It appears from these figures that there is much yet to be done toward the standardization of voltages in Illinois.

About 82 per cent of the companies reporting on type of motor control use knife or safety switches exclusively or in conjunction with other types of motor control. About 43 per cent of the companies reported installation of automatic starters, and only 31 per cent reported circuit breakers in use in their plants, mines or quarries.

## Table V—Alternating-Current Motor-Operating Voltages of Industrial Plants

| Industry | Total Number of Companies Reporting on Alternating-Current Motor Voltages | Number of Companies Reporting Various Motor-Operating Voltages — Voltages: 110 | 115 | 200 | 210 | 220 | 230 | 240 | 250 | 290 | 400 | 440 | 480 | 550 | 2,200 | 2,300 | 2,500 | 4,000 |

| Totals for all industries in Illinois | 425 | 1 | 15 | 2 | 1 | 14 | 24 | 368 |

The largest motor installed was reported by an iron and steel plant, but only seven companies in the state reported motors of more than 1,000 hp. Slightly more than 50 per cent of the companies in the state reported the largest motors under 25 hp. More than 36 per cent of the companies reported that the smallest motor installed ranged between $\frac{1}{8}$ hp. and $\frac{1}{4}$ hp.

### ODD FREQUENCIES USED TO CONSIDERABLE EXTENT

More than 86 per cent of the plants and mines use three-phase, 60-cycle service in the operation of their motors and almost 6 per cent reported the use of two-phase, 60-cycle service. Of the other odd frequencies used three-phase, 25-cycle was used by fifteen companies. The use of odd frequencies to such a large extent is probably due to the continuous operation of private electric generating plants which were installed several years ago. Table VIII shows the use of the various frequencies in the industrial plants and mines of Illinois.

It is estimated that there are a total of 5,277 boilers installed in the industrial plants, mines and quarries of Illinois. The total estimated rating of these boilers is placed at 1,197,223 hp., or an average rating of 230 hp.

**Table IX—Types of Motor Control Used in Industrial Plants of Illinois**

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

## Westinghouse Disclaims Special Advantages in Superpower Development

*To the Editors of the* ELECTRICAL WORLD:

Some time ago the Westinghouse Electric & Manufacturing Company became interested in the work of Frank G. Baum, a consulting hydro-electric engineer of San Francisco, in preparing a plan for the ultimate electrification of the United States by means of superpower or interconnected systems, involving the development of water powers and the construction of steam plants in a manner most economically to produce and distribute this power. Mr. Baum's plan involves the use of main trunk or reservoir lines carrying a pressure of 220,000 volts. This voltage, although only recently accomplished in practical service, is in successful use in California and is planned for use in other sections. A superpower system such as Mr. Baum describes in his "Atlas" will permit transmission of power long distances, and by the interconnecting of these superpower systems it is entirely feasible to cover the whole United States, although certain sections in areas west of the Mississippi River may not immediately be developed.

The Westinghouse company associated itself with Mr. Baum in this work, and its engineers believe his principles to be sound. The Westinghouse company, however, is not in the public utility business and has no financial interest in the public utility; and, while it has and will support the electrical development of the United States along the lines of Mr. Baum's report or some modification of it, the actual accomplishment of this tremendous work, which will be of great benefit to the people of the country, lies in the hands of the public utility men themselves. There is nothing in our connection with superpower development which gives the Westinghouse company any manufacturing advantage over any other electrical manufacturer.

GUY E. TRIPP,
Chairman of Board.

Westinghouse Electric & Manufacturing Company, New York, N. Y.

## Bureau of Mines Findings on Powdered Coal Disputed

*To the Editors of the* ELECTRICAL WORLD:

On page 19 of Bulletin 217, entitled "Preparation, Transportation and Combustion of Powdered Coal," by John Blizard, published by the Bureau of Mines, the following conclusions have been reached by the author:

"In the direct system the coal may be blown directly to the furnaces from the grinding room in a current of low-pressure air. With the indirect system separate bins and feeders are required for each furnace, but the extra expense involved is offset by three factors, namely, (1) less danger from explosion, (2) greater control over the rate of feeding the coal to the furnace, and (3) greater reliability, since with the direct system the whole plant will be shut down should the central distributing fan break down."

In the above quoted paragraph Mr. Blizard has ar-

rived at three conclusions which are erroneous and misleading and are not borne out by real facts and careful investigation.

First—Will Mr. Blizard set forth statements and facts to prove that the direct system as described by him, if correctly designed and intelligently operated, is subject to any possible danger of explosion?

Second—Will Mr. Blizard show us in what possible manner there is less control of the coal feeding into the furnace by the direct system than with the indirect system?

As for the third statement, any schoolboy knows that his father carries a spare tire on his automobile to use in the event of a puncture or blow-out, and will Mr. Blizard point out any reason why a spare fan cannot be installed and connected to the distributing system so as to be available at all times? With such a fan the direct system affords a greater sense of reliability as regards all of the furnaces than is possible with any other system. C. F. HERINGTON.

Heyl & Patterson, Inc.,
Pittsburgh, Pa.

### Declares Megohm Readings Most Significant When Tested Circuits Are Isolated

*To the Editors of the* ELECTRICAL WORLD:

Since March, 1921, we have made megohm-meter tests of more than thirty-five thousand objects, and, properly analyzed, this really means we have made more than a hundred thousand actual tests because several separate tests are usually made on each object. We have found that tests are wholly without value unless the part to be tested is isolated electrically from other parts of the same machine. For instance: A 500-kw. direct-current generator was a source of much annoyance, involving a lawsuit and a great deal of unpleasant argument between testing engineers of certain great electrical manufacturing concerns and an independent engineering organization. The Royal Indemnity Company was called in as a sort of arbitrator and was able to convince the engineers that their various elaborate testings of the machine really did not give them the results which they expected, merely because they had tested the machine as a fully assembled unit instead of isolating its several parts. Our tests were made by first disconnecting the fields from each other and from the circuit, disconnecting the field rheostat, placing several thicknesses of writing paper between field connections and the frame, disconnecting the armature and series fields, disconnecting the brush lead, and, in short, isolating every part so far as practicable, except that commutator lug connections were not disturbed nor were the fields removed from the frame.

Under the above condition the machine showed infinity everywhere except from the casting on one brush yoke to a brass washer, which latter normally made connection from the lead to the brushes. A test at this point showed only about 21,000 ohms resistance. When the insulating bushing was removed from this yoke it was found to be in apparently perfect external condition but was thoroughly carbonized internally, the carbonizing being much in the form of a laminated steel plate where both surfaces seem to be perfect.

With alternating-current motors it is more frequently than not very difficult to isolate the stator from the leads to the compensator or switch, because the leads are so frequently soldered and disconnection cannot be made without stopping a machine for too great a time.

In another case a 25-kva., single-phase, 33,000-volt transformer showed practically no resistance to ground from any one of the high-tension leads to the transformer case. It was decided that the coil should be lifted out of the case, and after this was done the test showed infinity. Two defects were found, but since only one test was made after lifting the coils out we did not know which of the defects produced the ground. One defect consisted of a piece of U-shaped bare No. 4 copper wire which had in some manner become wedged between one of the coil connections and the case; the other defect consisted of a bushing which must have been defective at the time it was installed in the factory.

We have discontinued the placing of much dependence upon megohm-meter tests of transformers except in those cases where we are able to isolate the coils and other parts from each other. This, of course, is seldom practicable, but obviously it is a great waste of our money to replace a transformer which shows a low reading and have this transformer sent to a repair shop, when perhaps some minor condition produces a ground.

In one case the connection from one coil of a three-phase transformer touched the casing, the connection having been left too long at time of installation and been bent in such a manner that it touched the casing and eventually grounded. Actually, the only repair necessary was to cut out a short piece of the lead and solder in a new piece properly insulated, and if we had isolated the several parts before making the megger tests, we should have saved in repair cost.

Machines with a considerable amount of electrostatic capacity make it absolutely essential that meggers should be properly connected to the work; that is, that the user of the megger must be certain to observe the plus and minus signs on the megger binding posts and not connect the minus lead to the part where the plus lead must be connected. For with improper connecting it is known that high-resistance grounds (and these are usually concealed) may become sealed over through the action of hydrogen bubbles and an untrue conclusion be arrived at.

The use of our megohm meters has not been without attendant embarrassment to us, for very frequently the readings require us, as a matter of self-protection, to suspend insurance on certain objects which have been fully approved by other testing engineers who may be on the ground at the time, and in order to relieve ourselves of the embarrassment and justify our position, we are sometimes put to considerable expense in proving our case. Nevertheless, we know from ample experience that the use of the megger is essential.

We have no set rules for determining how low a reading may be before we will condemn the object, each individual case requiring the use of judgment on the part of the testing engineer. Nominally the following is about what we practice:

Where the machine is in apparently perfect dry and warm condition, we require that it show a reading of not less than 250,000 ohms. Where the machine is in "wet" condition, as in the humidity rooms of textile plants or in mines, refrigeration plants, wet basements, ice-cream plants, chemical works, tanneries and other "wet" industries, we will pass machines which show only 150,000 ohms, and not infrequently we pass those which show 100,000 ohms, but never any under any circumstances those which show less than 100,000 ohms. This includes only machines whose voltages are in excess of 200. WARREN HILLEARY,

Superintendent.
Royal Indemnity Company,
New York, N. Y.

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Pioneer Powdered-Coal Installation Data

**More than 190,000 Tons of Coal Burned by Western Company with Boiler Efficiency of 80 per Cent—Description of Complete Plant—Operating Costs Itemized**

BURNING coal in pulverized form has been found to be a very satisfactory solution of the difficulties encountered by the Puget Sound Power & Light Company in using the poor grades of coal which are found in its territory. The advancing price of oil made it necessary to consider changing the Western Avenue steam-heating plant from oil to coal burning, so the company decided to equip one of the boilers of this plant for burning pulverized coal, making tests on various coals before installing a complete plant.

A 300-hp. B. & W. boiler was used for the tests. The coal was prepared by the Pacific Coast Coal Company, which already had a pulverized-fuel installation. Few changes were made to the furnace other than removing the oil-burning equipment. Practically all of the coals mined on the Pacific Coast were burned, and the results were so good on this boiler that it was decided to equip the entire plant of ten boilers, with a total rating of 4,100 hp., for pulverized burning. An installation of a complete drying and pulverizing plant was also made.

### Average Boiler Efficiency 80 per Cent

Already more than 190,000 tons of coal has been burned in the completed plant, and an average boiler efficiency of 80 per cent has been maintained. High boiler ratings have also been made without trouble. The coal used in this plant is a refuse that had accumulated at the company's mine over a period of twenty years. The coal had been discarded from the washery and is very fine in size, practically all of it passing a twenty-mesh screen. Owing to the fact that a great deal of mine dirt was also mixed with the coal, it was found advantageous to install a washing plant at the coal dump, thereby reducing the ash in the coal from 25 per cent to about 12 per cent and eliminating the freight cost on the 13 per cent difference as well as the expense which would be entailed in drying, pulverizing and handling this amount of material from the boiler furnaces.

It might be interesting to note that in another plant where coal is burned in an excellent stoker installation an average of only 65 per cent boiler efficiency is attained and the overloads that may be carried are limited. The coal used in the stoker installations is uniform size pea coal, carrying less ash and moisture.

### Cost of Preparing Fuel 71 Cents a Ton

The yearly load factor for the pulverizing equipment is about 39 per cent, this low figure being due to the fact that the plant is purely a heating one with periods of extremely low output in the summer months. The actual operating cost of preparing plant, not including overhead cost of taxes, interest, depreciation, etc., is about 71 cents per ton. This cost is itemized in the accompanying table. The over-all efficiencies on the basis of pulverized coal averaging approximately 9,300 B.t.u. per pound range from 77 to 81 per cent. This figure represents operating conditions with firing of from two to five cold boilers a day.

The costs of labor and power for pulverizing, as shown in the table, are undoubtedly higher than would be the case in a plant originally designed to handle pulverized coal, on account of the raw coal being conveyed a considerable distance to the plant and because the coal, being very fine and wet, requires considerable power in its preparation. The period for which the figures were obtained was, moreover, one when labor was at its peak. As the plant has a capacity of 300 tons per day and an average of only about 150 tons is used, the labor cost is further affected.

OPERATING COST OF PREPARING PULVERIZED FUEL

| | Per Ton | |
|---|---|---|
| Maintenance: | | |
| Driers | $0.014 | |
| Mills | 0.038 | |
| Miscellaneous equipment | 0.023 | |
| Total maintenance | | $0.075 |
| Operation: | | |
| Labor | $0.312 | |
| Power (estimated at 1 cent per kilowatt-hour) | 0.260 | |
| Fuel | 0.060 | |
| Total operation | | 0.632 |
| Total operation and maintenance | | $0.707 |

### Boiler Combustion Space of 2.3 Cu.Ft.

The equipment was designed and installed by Stone & Webster. After a good deal of experimenting it was finally decided that vertical firing was not practicable on account of there being so little depth available for furnaces under the boilers. Consequently all of the boilers were equipped with horizontal burners. As the furnaces were finally constructed a combustion space of 2.3 cu.ft. per rated horsepower was obtained under the four 300-hp. and the three 400-hp. boilers. Under a 500-hp. and a 600-hp. boiler 2.5 cu.ft. per horsepower was obtained, while under a 600-hp. boiler it was possible to install a furnace which gave a capacity of only 1.89 cu.ft. per rated horsepower.

With the installation of two horizontal burners on the smaller-size boilers it is possible to maintain higher ratings and efficiencies than when these boilers were oil-fired.

In the drying and pulverizing plant two indirect pulverized coal-fired driers are used and, as originally installed, had exhaust fans and cyclones, the purpose of the latter being to remove the coaldust from the gases. However, it was found that all of the dust was not removed so a washer was installed in conjunction with the cyclones. This consists of a simple spray washer of concrete construction, the baffles being of spruce wood. It has proved satisfactory and entirely eliminates the

dust nuisance which is generally encountered when driers are installed.

In the pulverizing part of the plant are three Fuller screen mills and one Raymond air separator mill. The screen mills deliver the pulverized coal into a screw conveyor, and in so operating it was found that the mill room became quite dusty. A fan was installed and connected to the boiler furnaces. It was found that a slight suction on the screen mill could be maintained which eliminated all of the dust from the plant and also materially increased the capacity of the mills. This proved so satisfactory that another fan was installed and connected with the return air line of the separator-mill system, which improved the operating condition of this mill.

The drying and pulverizing plant is situated one block below the main business and mercantile sections of the city, but no complaint regarding ash from the stacks or dust from the pulverizing plant has been made. One of the reasons for this is the very high-flame temperature maintained on the pulverized coal. The burners are equipped with steam jets which shorten and intensify the flame. Approximately 75 per cent of the ash from the coal is removed from the furnaces, rear passes and breeching. The ash from the rear connections and breechings is, of course, very fine, and this is handled by sluicing, whereas the ash and slag from the furnaces is raked out and handled in a small dump car. This car is pushed along on a track in front of the furnaces and delivers into a skip hoist electrically operated that empties into a concrete bunker from which the ash is drawn off and transported either by truck or railroad car.

# Extracts from an Operating Code

BY FIELD EDITOR ELECTRICAL WORLD
New York, N. Y.

## Routine Care and Maintenance of Auxiliary Apparatus

THE rules given below for the routine care and maintenance of stokers, stoker motors, fans, feed-water heaters, evaporators and soot blowers have been abstracted from the operating code of the Philadelphia Electric Company. These rules, which are not complicated, should always be kept in mind by central-station operators.

STOKERS

1. Clean the external mechanism daily.
2. Gear boxes should be inspected weekly and oil renewed when necessary.
3. Brush the chains with a wire brush daily (before oiling).
4. Oil the chains daily.
5. Inspect and oil the line shaft on each shift.
6. Examine the clutches and bushings weekly.

STOKER MOTORS

1. Change the oil and clean the bearings every two weeks.
2. Motors should be thoroughly cleaned periodically as directed by the chief electrician.

FANS

1. Blow the soot from the induced-draft fans when necessary.
2. Clean the runners of the induced-draft fans every two weeks or oftener if necessary.
3. When a boiler is off the line, inspect the fan runners and stay rods for wear and corrosion and clean them.
4. Clean the interior of the fan housing and flues every year, or oftener if necessary.

FEED WATER HEATERS

1. Clean the control valves on the heaters every eight weeks, or oftener if the valves stick.
2. Inspect the heaters every six months and clean when necessary.

EVAPORATORS

1. Remove the coils from first-effect and second-effect shells every six months and inspect for scale formation.
2. If the scale has not been completely removed by the daily cracking-down process, remove the coils from the headers and immerse them for twenty-four hours in a 10 per cent solution of commercial hydrochloric acid.
3. Inspect the evaporator auxiliary heater.
4. Examine the blow-down valves weekly for leakage.
5. Test the safety valves monthly.

DUST BLOWERS

1. Inspect the stops, hand wheels and chains and see that they are not broken or fouled.
2. Repack stuffing boxes, if necessary.

## Operating Constant-Voltage Transformers

WHERE the secondary switches of transformers are disconnecting switches, it might be thought that these switches would be incapable of breaking the load current and therefore that the primary switch should be opened first. This is not true in most cases, as a transformer on being shut down is nearly always running in parallel with another and, on account of the alternative path through the other transformer, the secondary circuit can be broken by the disconnecting switch with practically no arc. This leaves the primary oil switch to perform the more difficult duty of breaking the magnetizing current, which would cause a serious arc if broken in air by the disconnecting switch.

It is important, in shutting down transformers, to open the primary and secondary switches before shutting off the cooling medium in order to prevent any possibility of rise of temperature after shutting down the cooling apparatus.

## Requirements Necessary for Pit-Shaft Cables

OWING to lack of experience or real interest in the subject by some electrical mining engineers, a great deal of trouble is caused by the wrong choice of their pit-shaft cables. This class of work is certainly a severe test on the cable installed, yet by care in the selection of the type to be used faults, with the expensive loss of service they entail, can be eliminated. Owing to the great variation in pit shafts, depth, water and the method by which the shaft casing has been carried out, every engineer should make an individual study of his own pit.

The problem of primary importance to be solved by the electrical mining engineer about to install power and light below surface is the types of cables to be used. These readily fall under the following headings: (1) Vulcanized bitumen cables, (2) paper lead-covered, (3) paper leadless, and (4) rubber.

VULCANIZED BITUMEN DOUBLE WIRE ARMORED CABLES

Vulcanized bitumen double-wire armored cables are, speaking broadly, the best for pit-shaft work, provided suitable care is taken in their manufacture. When using bitumen cables, it should be insisted they be all bitumen—that is, each core separately insulated with bitumen, laid round a center core of bitumen and the whole incased in bitumen. The interstices in the core are filled up with a bitumen compound, thus preventing water spreading down the cable at a damaged point. This filling compound is of such a nature that

it will not melt in the event of the overloading of the copper. It naturally follows that in the event of mechanical damage to this class of cable only the por.ion impaired will need attention. Some difficulty was at first experienced due to the decentralization of the bitumen at high temperatures and its brittleness at low. This manufacturing trouble has now been eliminated, thus it becomes possible to utilize this class of cable for working conditions where the temperature ranges from, roughly, 20 deg. to 130 deg. F.

Further, all materials of a hygroscopic nature have by careful research work on the actual properties of the bitumen been proved to be unnecessary. The importance of protecting the armoring of the cable is one which must not be overlooked. The inner and outer jute layers, which are in the former laid up over the over-all sheath of the bitumen and in the latter over the double steel-wire armoring, should in conjunction with the armor be efficiently compounded with a heavy waterproofing mixture. As most pit shafts are generally very wet and the water therein far from pure, care must be exercised to guard the armor from corrosion. The method of waterproofing just described will secure the cables against action due to acids in the seepage, but electrolytic trouble caused by leakage currents can be prevented only by an adequate system of mechanical and electrical bondings to a proper earth.

Another kind of armoring which may be utilized is water-resisting impregnated manila rope, which is not shrinkable and has the great advantage of considerably reducing the weight of the cable, besides allowing single-core cables to be used for alternating work—something not feasible with steel armoring. Bitumen cables, which follow the same law as lead-covered cables, must not be installed after long exposure to low temperatures. These cables should be supported at very frequent intervals, the distance naturally depending on the weight.

### Paper-Insulated, Lead-Covered Armored Cables

One of the advantages possessed by paper-insulated, lead-covered cable with wire armor is the manner in which it is able to stand external heat and the easy internal dissipation of the heat, but it has the disadvantage of being composed of hygroscopic materials. This cable, therefore, when damaged calls for much greater and more expensive repairs than a vulcanized bitumen-insulated cable. Water being usually present in pit shafts, it follows that upon puncture of the lead sheath and the consequent entry of moisture a considerable amount of water will become absorbed and be drawn down through the interstices of the core with the result of further faults.

The insulation of the dielectric of these cables being of oil, trouble often occurs due to the compound draining away to the lower level. Cases have been known where the lead sheathing has burst open owing to the pressure exerted by the flowing of the compound. This can be remedied by the use of a hard compound and the insertion of a clause in the cable contract calling upon the manufacturers to suspend a length of cable vertically for forty-eight hours at a temperature equal to that of the pit shaft, etc., with the end open. The amount of "bleeding" can then be noted. Owing to the acids in the water of many pit shafts, the lead and armor are open to attack unless exceedingly great care is taken during manufacture. Vulcanized bitumen is proof against acid pit-shaft waters, and it has been said that it does better in acid than in pure water.

Another class of paper-insulated, lead-covered armored cables used which may interest mining engineers is made of impregnated paper with a vulcanized bitumen sheath over it.

### Paper-Insulated, Leadless Armored Cables

Except for the absence of lead covering, paper leadless armored cables fall in the class just mentioned and are simply those insulated with paper, vulcanized bitumen or rubber sheathed and armored. They have approximately the same advantages as regards heat dissipation as a lead-covered cable has.

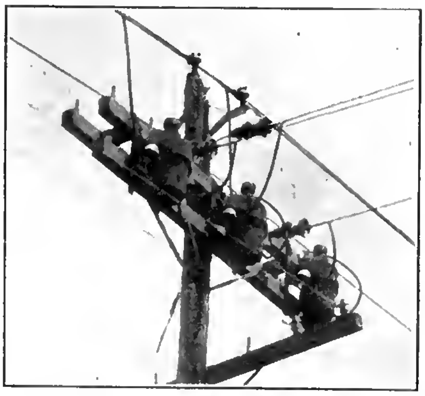
### Rubber Cables

There is no doubt that rubber cables under general conditions are the best from both electrical and physical standpoints. Rubber has the disadvantage when applied to large cables of being a virtually impossible commercial proposition on account of its high cost. In short lengths, however, such as are needed for connections from joint boxes and trailing cables, it is generally used after treatment with fire-resisting tapes and will give excellent results. For these purposes only the very best rubber should be utilized in under-surface operation, as one of the objections has been the difficulty found in testing the rubber. Numerous tests have been devised, but it has been found possible to make a composition which will pass any of these tests individually and a combination of many of them and yet be of a low-grade material.

W. E. BOYLE,
New York, N. Y. Engineer.

## Service Tap-Off Made with Minimum Equipment

SERVICE from a three-phase line operated at 6,600 to 13,200 volts and traversing outer suburban territory presents to the central-station engineer the problem of minimizing



INDUSTRIAL-PLANT HIGH-TENSION SERVICE READILY ACCESSIBLE

material without sacrificing convenience of operation. The United Illuminating Company, Bridgeport, Conn., utilizes the pole construction illustrated for this work, only three close-spaced cross-arms being required in addition to the metal bracket carrying the feeder phases. The feeder is run at the top of the pole, one phase being carried on a pin-type insulator and the two other phases on similar insulators supported on a metal bracket. Parallel to the feeder are three well-braced cross-arms, two of which are cross-connected near the ends by short filler pieces. Pole-type high-voltage oil cut-outs are mounted on two of the arms as shown, and short taps are run to the cases from the feeder phases. The feed to the factory is dead-ended in each phase on strain insulators attached to the upper arm above the cut-outs, and short taps connect these leads with the cut-outs. The whole construction is accessible, with direct wiring runs, and yet requires little material.

RESULTS OF NINE TESTS WHICH ESTABLISH THE DOLLARS AND CENTS VALUE OF GOOD LIGHTING

| Tests at | Type of Work | Average Foot-Candles with Old System | Average Foot-Candles with New System | Increase in Production, per Cent | Cost of Addition in Percentage of Payroll |
|---|---|---|---|---|---|
| Pyott Foundry Company | Pulley finishing | 0.2 | 4.8 | 35 | 5 |
| Foote Brothers | Soft-metal bearing | 4.6 | 12.7 | 15 | 1.2 |
| Lee Loader & Body Company | Heavy steel machine | 3 | 11.5 | 10 | 1.2 |
| Stromberg Carburetor Company | Carburetor assembly | 2.1 | 12.3 | 12 | 0.9 |
| Dolphin Jute Mills | Jute spinning | 1.5 | 9.0 | 17 | No data |
| Dover Manufacturing Company | Manufacturing electric and gas sad irons | 0.7 | 13.5 | 12.2 | 2.5 |
| General Electric Company | Semi-automatic buffing brass shell sockets | 3.8 | 11.4 | 8.5 | 1.8 |
| Detroit Piston Ring Company | Manufacturing piston rings | 1.2 | 18.0 | 25.8 | 2 |
| U. S. Post Office Department | Letter separating | 3.6 | 8.0 | 4.4 | 0.6 |
| Average | | 2.3 | 11.2 | 15.5 | 1.9 |

## Better Lighting Increases Production 35 per Cent

ALTHOUGH former tests indicated that production could be increased from 10 per cent to 35 per cent merely by improved illumination, a certain amount of hesitation seemed to exist, both within and outside of the lighting profession, about accepting the extremely great "productive value" of lighting so strongly indicated by the tests. Therefore a number of other investigations of similar nature were begun. These were carried on in different industries covering a variety of industrial operations. The results of nine such tests are now available and are given in the accompanying table. In every case when the intensity was raised and a more even distribution of light provided production increased.

Among the tests reported, special interest attaches to the results of the investigation recently made in the United States Post Office Department. In this investigation, conducted by the Office of Industrial Hygiene of the United States Public Health Service, it was definitely ascertained that when 8 foot-candles of illumination was provided instead of 3.6 foot-candles there was an average increase in speed of at least 4.4 per cent in the work of the letter separators. Assuming that the same relative increase of speed would prevail in all the divisions of the post office—a reasonable assumption—the net saving for the one post office in which the principal survey was made would be about $109,000 per year, or almost three times the increased cost.

Average figures can serve to give only a very general indication of the results that may be obtained by installing higher levels of lighting in industrial plants. Averaging the results of these nine tests, however, we find that raising the average initial illumination from about 2.3 to 11.2 foot-candles resulted in an increase in production of more than 15 per cent, at an additional cost of only 1.9 per cent of the payroll.

Taken together, this group of tests in widely separated industries firmly establishes the fact that, in addition to its obvious value in preventing accidents, lessening eye strain, raising shop morale and bettering conditions generally, good lighting has a definite and tangible production value which can be expressed in terms of dollars and cents. The plant in which the workmen are handicapped by poor lighting is carrying an extra burden in meeting the competition of other plants having abundant, properly distributed and well-diffused light.

## Preventing Accidents from Falling Material

A PROLIFIC cause of accidents in overhead-line work is the falling of tools or other small objects that are being raised by means of hand lines. To prevent such accidents the Philadelphia Electric Company uses a wooden-bottom canvas bucket for the hoisting of all small tools and materials. Experiments are also being conducted with an inverted conical tent around the pole to catch falling articles and prevent injury to workmen or passersby.

## Public Utility Bonds as Investments for Mutual Savings Banks*

### Factors Essential in a Utility Company's Set-Up to Make Its Securities Desirable as Well as Legal Investments for Savings Institutions

By George Stevenson
Treasurer Society for Savings, Hartford, Conn.,
Chairman of Public Utility Committee, Mutual Savings Bank Association

THE public utility business as we know it today is still young. It has not had time yet to standardize itself. It is a splendid business. It is as fundamental to human needs as transportation. It is managed, very generally, by men of high integrity, commanding ability and public spirit. The advances they are making in methods employed and results attained are measured almost by days. They deserve support. They are good custodians of capital. Can the savings banks at the present stage supply to them a part of what they need? If not, can the savings banks point out to them the prerequisites to doing so in the future? I speak for you all, I am sure, when I say that the savings banks want to see a way opened for investing in the bonds of public utility companies, if it can be done with a sufficient degree of safety. In this, the banks have two motives. The lesser one is to broaden the field of possible investment; the greater is to assist in the building up of our American communities to greater prosperity and larger comfort and happiness.

The theory of loaning on tangible security is that the lender takes in his hand a string by the pulling of which he may, if necessity requires, bring to himself the thing pledged. This thing he does not want to retain in his possession, with the burden of managing it; he wants to be able to turn it into dollars—enough dollars to cover the loan he made. The chief characteristic required in the thing pledged is that it gives promise, beyond any fair doubt, of continuing to produce income under any circumstances reasonably conceivable. Bricks and stone, steel and copper, no matter how well and intricately fashioned, are valueless as security unless they earn money—a fair return on their cost, with all proper allowances—and seem sure to continue to do so.

What, in a general way, must be the set-up of a public utility company to enable it to conform to this requirement? Let us agree for the moment to consider only the company which furnishes electric light and power—with gas not more than a small subsidiary, and without commitment in any large way to ownership in street-railway properties or to dependence for any large fraction of its earnings upon energy sold to a street railway.

#### Essential and Qualitative Factors

The factors involved may be divided into two classes—essential and qualitative. If any particular company fails to conform to the first, there would be no use in testing it by the second.

The essential factors may be indicated as follows:

1. Is the company under the regulation of a state public utility commission constituted in accordance with enlightened, conservative thought and with a high regard for the rights of private property?
2. Does the commission require accounts to be kept according to a uniform national classification adopted by a substantial number of other states?
3. Does the company deal directly with the ultimate consumer in the greater part of its business?
4. Does its franchise extend well beyond not only the maturity of the issue of bonds under question, but also any other large maturities?

The qualitative factors are questions of degree, but are of great importance to the investor.

1. What is the ratio of customers to population? Saturation is said to be reached in retail electric companies when there exists one customer to every four of the population. A worse ratio than one in twelve indicates a partly developed territory and one in which the majority of the inhabitants are not dependent upon the utility.
2. What is the nature of the territory? Are its interests well diversified and sure to be permanent? Is it subject to booms and declines, requiring the company to expand with the boom and giving it "hard sledding" in the decline?
3. What is the character of the property? How does it allow for depreciation and for obsolescence? Can it take care of sudden and unexpected obsolescence due to new inventions and revolutionary improvements?
4. What is the proportion of debt to equity? With some companies 50 per cent equity would be enough, but with most companies it would be far too little.
5. What is its earning and dividend record? This point is important, but it is far from being the true yardstick which it is often taken to be. The absence of a good record is, of course, prohibitive, but the presence of a good record is only one of many factors which must be considered.
6. What is the ratio of earnings to plant investment?
7. Is the company controlled by a holding company which may strip it of all possible earnings in order to pay dividends upon a thin upper layer of pretended equity, unjustified by any possible economies in management or operation?
8. Of what type is the management? Is it high-minded? Has it a proper conception of serving the public? Is it on good terms with its public? Has it the courage to tell the public the truth? Does it possess financial common sense? On the strictly technical side of manufacturing and distributing electrical energy, how does it compare with the management of other companies?
9. What is the local political situation? We need not dwell on this, but we must not leave it out of our reckoning.

I have set down above what seem to me to be the chief factors in the strength or weakness of a public utility promise. The four which I have classed as "essential" are easily susceptible to embodiment in a formula. Of the nine which I have termed "qualitative" some can be so embodied, others not. The latter are in many respects the more important.

I confess my own utter inability even to start to make up a formula in accordance with which I should be

*From an address before the annual convention of the National Association of Mutual Savings Banks at Buffalo, N. Y., June, 1923.

willing to see the bank with which I am connected buy public utility bonds. I should feel safer in buying such to rely solely on horse sense, after we had studied every possible phase of the security in question. Yet I am unwilling to surrender the principle of the formula for determining what securities the savings banks in our state shall buy.

To me it appears that we shall require further time, more information and a further step toward standardization by the public utility companies before we can formulate the conditions under which the savings banks can safely invest in public utility securities. In the meantime we can seek earnestly and with open minds for further light.

## Baltimore Merchandising Policy Approved by Commission

IN CONNECTION with the reduction of rates of the Consolidated Gas, Electric Light & Power Company of Baltimore, as reported on page 1484 of the ELECTRICAL WORLD last week, the Maryland Public Service Commission included in its decision an interesting opinion regarding the company's merchandising policy. Aside from indicating that the receipts from merchandise sales must be reported by the company as miscellaneous revenue, the commission investigated the company's methods of conducting this business.

Some time ago the Baltimore company engaged in very extensive merchandising operations, embracing the sale of a rather wide variety of related kitchen equipment, crockery, glassware and so forth. Although this policy has since been largely discontinued, there had been certain complaints by dealers that the practice of the company precluded successful competition by private concerns. The commission made a careful study of the problem and in its decision pointed out that among customers there is a decided approval of the company's service and perhaps even a desire for extension of this branch of the business.

That part of the commission's decision referring to the Baltimore company's merchandising policy reads as follows:

It is our belief that the attitude of the commission toward the extensive merchandising business conducted by the company should reflect the prevailing public opinion of our age and generation and particularly contemporary local judgment on the social and economic consequences that will result from the course now being pursued by the company.

In our opinion the whole field of the ordinary gas and electrical appliance business in Baltimore soon will be filled by the company. It is but a step to wiring and pipe-fitting. At times the merchandising has bordered on the grocery trade.

The terms offered are easy and the service is convenient and popular, but the opportunities for soliciting and selling afforded the representatives of the company when in the homes for meter inspecting or reading and the advantages of prompt and certain collection on merchandise billed with charges for gas and electric consumption, which latter may be enforced by shutting off the service, make the keenest competition and shrewdest merchandising by private concerns futile and vain.

In our efforts to elicit expressions of opinion from retail merchants, tradesmen, artisans and the general public concerning the merchandising conducted by the company, we have failed to discover any organized opposition or outspoken objection on the part of retail business or skilled labor to the continuance of the marketing of appliances by the company, and we are led to believe that among the company's patrons there is a decided approval of the present service and perhaps a desire for extension of this branch of the company's business.

Under these circumstances, we feel that we should not comply with the request of certain dealers who ask that the company be restricted in its merchandising activities and practices. We do not concede, however, as contended by the company's counsel, that the commission is powerless to prevent a public service corporation, enjoying the privileges of a monopoly through the protection afforded by the commission pursuant to legislative will and current economic thought, from employing those special rights and advantages to extend its monopolistic control over lines of endeavor that otherwise would remain individualistic and competitive, yet, in the absence of an expressed or ascertainable public opinion on the subject, we believe that we should not at this time interfere with the comnany's merchandising department other than to order that the revenues from this branch shall be reported by the company and considered by the commission as other miscellaneous revenue.

If the company desire that this revenue be treated in any other way, then capital for the merchandising department must be provided from an independent source and charges for rent and services must be made at adequate and remunerative rates.

# Spokane's Record-Breaking Range Sale

### In a Six Weeks' Campaign the Washington Water Power Company Sold 431 Electric Ranges, Which Will Increase Its Gross Annual Revenue by $39,000

DISCUSSION of this electric range campaign and the value of the load aroused a great deal of interest at the N. E. L. A. convention in New York, June 4-9. It was pointed out by J. V. Strange of the Pacific Power & Light Company, Portland, Ore., that the additional revenue from these 431 ranges would increase the average annual income of the Washington Water Power Company by at least $1 per customer.

ON MAY 15 the Washington Water Power Company of Spokane completed a six weeks' campaign on electric ranges. Complete returns available the following day showed a total sale of 431 ranges, all of which were sold with a water heater, having a combined rating of 7 kw. A little more than one-half of these were sold in Spokane and the rest in various towns served by the company within a radius of 150 miles from Spokane. Most of the ranges sold were Westinghouse—types 2-19B and 3-19B.

The evening of May 14 a banquet was given by the Washington Electric Supply Company to celebrate the sale of 300 ranges, that being the total at close of business that day. However, J. F. Farquhar, general agent of the Washington Water Power Company, announced that he had yet to hear from fifty-five towns, and R. B. McElroy, speaking for Spokane, said that still more contracts would be taken the following day, the last of the campaign. These predictions were verified, as on the fifteenth 131 range sales were added to the list.

The total sale of 431 ranges in six weeks is a record for the country and shows what can be done by intelligent planning and persistent sales work, supplemented with adequate advertising. The essential details of the campaign are shown in Table I.

#### SPECIAL INDUCEMENTS

With each installation one four-piece "Cloverleaf" cooking set was given, and a bread-baking contest has been arranged for the month of June in which all purchasers are invited to participate. The winner of this contest will receive her range free of charge.

The banquet celebrating the sale was attended by forty guests, representing the Washington Electric

TABLE I—DATA ON SPOKANE RANGE CAMPAIGN

| | |
|---|---|
| Ranges sold in Spokane | 232 |
| Number of salesmen | 10 |
| Six city men, outside; four in electric shop | |
| Ranges sold outside of Spokane by 25 district agents | 199 |
| Total number of ranges sold | 431 |
| Gross sales value of ranges and water heaters | $107,000.00 |

| Average price of range and water heater installed | 249.75 |
| Terms, $9.75 down, $10 minimum monthly payment | |

Supply Company, the Westinghouse Electric & Manufacturing Company and the Washington Water Power Company. Willard Sebara, manager of the Washington Electric Supply Company, presided and outlined the features of the campaign. Lewis A. Lewis, sales manager of the Washington Water Power Company, stated that he had hoped to sell 150 to 200 ranges and that the results had surprised him. He pointed out that the success was due not only to the high caliber of the salesmen, but also to the co-operation of the other departments of his company, particularly the service, line and accounting departments.

J. E. E. Boyer, assistant to the general manager of the Washington Water Power Company, expressed his satisfaction and amazement at the results as a careful survey of

TABLE II—TERRITORY SERVED BY THE WASHINGTON WATER POWER COMPANY

| | Spokane | Towns Directly Served by Company | Total |
|---|---|---|---|
| Population | 115,000 | 55,000 | 170,000 |
| Residential consumers | 24,700 | 7,500 | 32,200 |
| Number of electric ranges in service, including those sold during campaign | 2,583 | 1,878 | 4,561 |
| Percentage of range users based on residential consumers | 10.5 | 25 | 13.9 |

business conditions throughout the territory made prior to the campaign had led him to believe that no exceptional success could be expected.

In Spokane the only preliminary advertising was a blind advertisement which appeared in the local papers one week before the campaign began. This was a 10 in. display consisting merely of "$9.75," inclosed in a circle. Beginning April 2, an insert was inclosed with every bill sent out by the Washington Water Power Company to residential consumers. Several illuminated signboards were installed April 1 in conspicuous positions on principal car lines. At the same time advertising was inserted in the three Spokane papers, as summarized in Table III,

BLIND ADVERTISEMENT WHICH AROUSED INTEREST PRIOR TO CAMPAIGN

and was run until the close of the campaign.

In the towns of the "Inland Empire" served directly by the company no preliminary advertising was done. Beginning April 1, a moderate program was carried out, consisting of window cards, slides for motion-picture shows and advertising in local papers, most of which are weeklies. A Westinghouse range demonstrator visited the fifteen principal district offices during the campaign. The net extra cost of actual advertising expense chargeable to the sale of ranges in the country towns did not exceed $3 per range.

From the most conservative standpoint, it can be stated that in proportion to the magnitude of the results the advertising was remarkably small in volume and low in expense.

### What the Range Sales Mean in Added Business

Before the campaign began 4,030 electric ranges were in service in Spokane and the "Inland Empire," representing the total sales since 1913, a period of ten years. By the intensive work of six weeks a total

TABLE III—NEWSPAPER DISPLAY ADVERTISING, APRIL 1 TO MAY 15

| | Morning Paper | Two Evening Papers | Total |
|---|---|---|---|
| Number of insertions | 10 | 21 | 31 |
| Total inches of advertising matter | 593 | 1,428 | 2,011 |

equal to 10 per cent of all range sales of the preceding ten years was reached. To put it differently, one year's work at the same rate would have equaled the results of the preceding ten years.

To central-station managers the revenue value of this business is at once apparent. The gross revenue resulting from the sale of 431 ranges and water heaters, at $90 per year, amounts to nearly $39,000.

The figures showing percentage of residential consumers who use electric ranges are especially interesting. They are as follows: Spokane, 10.5 per cent; Inland Empire, 25.0 per cent; Spokane and Inland Empire, 13.9 per cent.

Some of the towns have even higher percentages. Odessa, for example, shows 33 per cent. In such a comparison Spokane is somewhat handicapped because there artificial gas is available for cooking and coal and wood are generally a little cheaper than in most of the other towns. It is a safe inference that the percentage of range users in the territory will continue to increase rapidly during the next few years, so that this progressive community will hold its place as one of the most completely electrified in the country.

THIS KIND OF OUTDOOR ADVERTISING PROVED VERY EFFECTIVE

## An Argument for Better Street Lighting

A SURVEY made recently in thirty-two cities goes to show that from 17½ to 50 per cent of all automobile accidents are directly traceable to poor and insufficient street illumination.

In a list of the ten principal causes of motor accidents poorly lighted streets rank fifth. A census taken for 1921 showed that eleven thousand persons lost their lives from automobile accidents, while in 1916 only four hundred deaths were recorded. Though the increased popularity of the motor car is responsible for the increased ratio in later years, still had improvements in street-lighting equipment kept pace with the added number of car owners, the death toll of today would not have assumed such alarming proportions.

## Corner Stores to Exemplify Better Lighting

"WE AIM to get good lighting on each main corner in the cities and towns served by us," said Julius Daniels, head of the illuminating division of the Boston Edison Company, recently. "We have thirty-six stores operated by our company in the Boston and suburban territory, and by installing modern equipment in these strategic locations we expect to interest local merchants by demonstrating before their eyes the benefits of good illumination. This will be done in the forty-two municipalities reached by our lines. Stores will be canvassed actively during the summer in anticipation of fall business, and an endeavor to establish a 10 foot-candle standard of illumination in windows will be made."

Speaking of recent growth of store lighting, Mr. Daniels said that eight of the larger department stores of the city have been gone over, with the result that they are investing about $25,000 a year in additional electrical energy for illumination. The energy sales of the Edison Electric Illuminating Company of Boston have been increased in this way by about 600,000 kw.-hr.

## Opportunity in Extension of Highway Lighting

AT THE recent meeting of the Electric Section of the Empire State Gas and Electric Association at Utica, N. Y., some of the advantages and improvements in highway lighting were outlined by K. V. Farmer of the Syracuse Lighting Company.

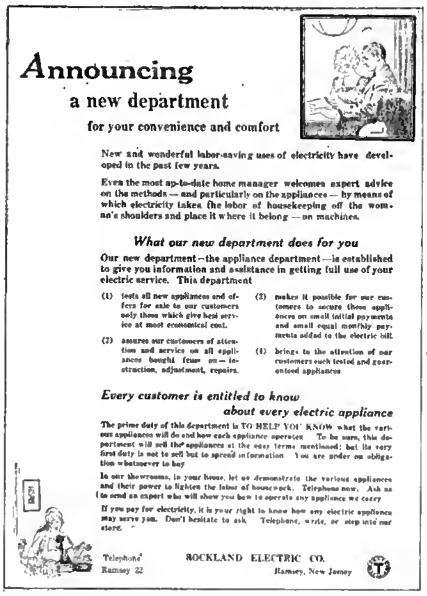
With the large and constantly increasing traffic on our highways, he pointed out, the necessity for some form of illumination to cover at least the congested sections and danger points becomes more and more apparent. Automobile clubs and individuals in various parts of the country are pressing the matter with numerous town and county officials, and it is possible that many more lighting installations of this nature will be made within a very short time.

The advantages of highway lighting may be listed as shown by the following:

1. It prevents accidents: (a) By reducing headlight glare; (b) by illuminating dangerous curves; (c) by throwing light upon the signs at the sides of roads and upon obstacles.
2. It adds to the comfort of night driving: (a) By relieving eye strain; (b) by assisting in making repairs; (c) by discouraging hold-ups.
3. It increases night traffic and thereby relieves day congestion.
4. It decreases running time and increases road capacity.
5. It helps bring electricity to the farm by providing a pole line.
6. It increases real estate values: (a) By tending to expand the city along highways; (b) by extending electrical conveniences.

## Fourfold Function of an Appliance Department

ANNOUNCING the recent establishment of an appliance department, the Rockland Electric Company, Ramsey, N. J., operated by Charles H. Tenney & Company, Boston, published the accompanying "feature advertisement," locally emphasizing the education and co-opera-



ADVERTISEMENT EXPRESSES RESPONSIBILITY OF UTILITY TO KEEP CUSTOMERS POSTED ELECTRICALLY

tive objects of the department in relation to electrical appliances and service.

Going far beyond the usual conception of an appliance department as a mere retail distributor of devices for lightening home labor, the company's publicity focuses attention upon the readiness of the utility to test appliances for quality and economy of service, to insure proper adjustment and repairs as well as instruction in their correct use, to arrange for easy terms of purchase and to keep customers advised upon developments in the field of appliance design. Similar publicity is being utilized in some of the other communities reached by Tenney service.

## What Other Companies Are Doing

**Worcester, Mass.**—A new schedule to be known as the "S" rate will shortly be placed in effect by the Worcester Electric Light Company to encourage the greater use of electricity in residences. Instead of being based upon the area of the residence with an energy charge added, the rate will be of the graduated-block type. The number of rooms will determine the number of kilowatt-hours to be billed at the initial rate, energy consumption in excess being billed at a lower figure. The smaller residences will be required to pay for fewer kilowatt-hours at the initial charge than will the larger houses.

**Thompsonville, Conn.** — Another step in the direction of central-station energy supply for interurban electric railway service in Massachusetts and Connecticut is planned in the projected dismantling of the generating station of the Hartford & Springfield Street Railway at Warehouse Point, the receiver of the road having requested court permission to eliminate the plant and purchase power, at a saving of $15,000 per year, from the Northern Connecticut Light & Power Company. Last year's operation of the railway plant cost about $64,000, and it is estimated that the necessary equipment to operate the road by central station energy can be provided for about $25,000. W. P. Schwabe is manager of the Northern Connecticut company.

**San Francisco, Cal.** — The employees of the Pacific Gas & Electric Company have organized a co-operative sickness and disability plan to provide financial assistance to employees when incapacitated by sickness or accident not classed as a compensation case. Upon payment of $1 initiation fee and $1 monthly any employee under fifty-five years of age and in good health will be assured a benefit at the rate of $20 a week for fifteen weeks. A period of fifteen weeks without benefit intervenes and then payments are resumed for another fifteen-week period.

**Chicago, Ill.**—Sales of appliances by the Public Service Company of Northern Illinois for the first four months of 1923 were considerably above the figures for the corresponding period in 1922. The merchandise sales department announced that the greatest volume of appliances included electric irons, vacuum cleaners and washing machines.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Three-Phase Generators for Waterwheel Drive.*—G. LEWINNEK.—Economic use of iron, steel and copper in large generators, together with the constantly increasing speed of waterwheels, has brought about a great improvement in these machines. Although in 1897 the best generator known weighed about 51 kg. per kva. at a speed of 55 r.p.m., in 1908 this weight was reduced to 5.8 kg. at 500 r.p.m., while today generators running at 750 r.p.m. weigh 3.1 kg. per kva. The author describes the different problems which were encountered before such highly efficient machines could be built safely. Artificial cooling and very strong mechanical construction were the main tasks which had to be solved. The paper gives the characteristic data for a number of actually built generators for different conditions, both with vertical and with horizontal shafts, pointing out their salient features. Modern stator and rotor constructions are described for sizes up to 20,000 kva. Methods are described for fastening pole pieces to rotors of high peripheral speed with and without the use of bolts. Fan construction for rotors, the design of collector rings and finally the lubrication methods are mentioned.—*A. E. G. Mitteilungen*, April, 1923.

*Problems in Steam-Plant Operation.*—E. A. QUINN.—In its report the prime movers committee of the Pacific Coast Electrical Association outlines practical suggestions as to types of apparatus and methods of operation which have proved successful in Western power-plant practice and recommends that a special study be given to an operating code.—*Journal of Electricity and Western Industry*, May 15, 1923.

## Generation, Control, Switching and Protection

*Low-Voltage Lightning Arresters.*—C. REINDL.—In the design of high-voltage protective apparatus simplicity of construction and a straight-line connection between line and ground were soon found to be essential for a dependable functioning of the arrester. Little has been done in this direction for low-voltage arresters. Very complicated designs and anything but a straight-line connection will be found in almost all of these types. It is claimed that all apparatus with an unprotected outdoor horn gap is useless for low voltages, because the gap cannot be set closer than 3 mm., which requires several thousand volts to bridge. The author recommends the use of an inclosed sphere gap, in a series of which two resistance rods in parallel are placed.—*Elektrische Betrieb*, April 24, 1923.

*Development of Automatic Control.*—H. C. HOYT.—The author considers the development of automatic control for electric stations. A great deal of information hitherto uncovered in former publications is included.—*General Electric Review*, June, 1923.

## Units, Measurements and Instruments

*Development and Testing of High-Voltage Insulators.*—J. F. SCHIED.—After a short historical sketch of the early beginnings of electric line insulators, the author describes the rapid progress which was made after the satisfactory experience with the first delta type of porcelain insulators. A number of mechanical difficulties were met when multi-petticoat porcelains were first introduced. The cementing of the individual parts to one unit with a cementing material of a different heat-expansion coefficient than that of the porcelain caused many a failure and started extensive research work. Not only was a suitable cement found, but such a shape was given to the parts as to minimize as much as possible any internal strain which might arise from stresses in the joints. The use of a yielding material between porcelain and metal, such as lead, did not prove to be successful. A great deal of suspicion is still entertained regarding the use of cemented porcelains, but in modern well-made insulators this is not founded. Multi-petticoat insulators with their individual parts fused together are much more unreliable, because there is no assurance that the fusing is perfect, and should air pockets remain between the parts, the unavoidable glow discharges through these will soon destroy the insulator. It has also been found that fusing frequently introduces irregular internal stresses, which make these types of insulators very susceptible to temperature changes. Sphere-head insulators, double-cap insulators, Jeffrey-Dewitt and screw-cap chains are described and criticised. Finally the equipment necessary for the electrical and mechanical testing of porcelain insulators is dealt with.—*Elektrotechnik und Maschinenbau*, April 29 and May 6, 1923.

*Orifice Coefficients—Data and Results of Tests.* — J. M. SPITZGLASS. — The author discusses the results of experimental work conducted on the use of orifice plates for measuring the flow of fluids in pipes. Extensive tests were carried on for a period of several years to determine the effect of the varying factors, such as the orifice ratio, the size of the pipe and the distance of the upstream and downstream connections, upon the pressure difference across the orifice plate. The tests were conducted on seven sizes of pipe, 2 in. to 12 in. in diameter. The paper includes a number of tables and a collection of characteristic curves that may be employed for determining the flow through orifice plates in a given size of pipe.—*Mechanical Engineering*, June, 1923.

## Transmission, Substations and Distribution

*Influence of the Form of the Voltage Wave on the Commutation of Rotary and Cascade Converters.*—R. J. JENSEN.—The author gives a review of an investigation by W. Linke of this problem on rotary converters (*Archiv für Elektrotechnik*, Vol. 10, 1914). Recent investigations made by himself indicate that the conditions in cascade converters are greatly complicated, especially if the number of poles in the two machines is different. A system which is loaded with a cascade converter may have a variety of harmonics. The author explains the reasons for the blackening of individual commutator bars on certain converters.—*Teknisk Tidsskrift, Elektroteknikeren (Danish)*, April 4, 1923.

*Automatic Mercury-Vapor Rectifiers.*—The Birmingham Corporation (England) electricity supply undertaking has had a steel-cylinder mercury-vapor rectifier working successfully for about eighteen months, and during the past twelve months this rectifier has been automatically controlled, supplying a lighting network. The system used employs a 230-kw., 500-amp., 460-volt tube connected to the outer busbars of the three-wire distribution system, the balancing being done by a battery of accumulators. The rectifier transformer is supplied with 5,000-volt, three-phase, 25-cycle current. Wiring diagrams for the installation are given.—*Electrical Review* (London), May 4, 1923.

*Large Power Transformers.*—W. S. MOODY.—The design and problems of transformers are of vital interest to all responsible for the transmission and distribution of electric power. The author gives data which will enable central-station engineers to understand the manufacturer's problems, as well as help operating engineers to a better understanding of the solution of their own problems.—*General Electric Review*, June, 1923.

## Illumination

*Flickering of Incandescent Lamps in Relation to the Unsteadiness of the Prime Mover.*—J. HEIN.—The main cause for flickering of lamps is the unsteady speed of the engine driving the generator. But other factors have a part, such as the characteristic of the prime mover (whether a reciprocating machine, a four-stroke cycle or a two-stroke cycle gas engine, a turbine, etc.), the speed of the engine, the voltage and current system and the type of lamp.

Considering the combined effect of all these factors, a formula is given to determine the maximum permissible voltage variation of a generator to obviate a disturbing flicker in any given conditions. A tabulation of lamp characteristics gives the required lamp factors. In three examples the way is shown to calculate the voltage fluctuations for given irregularities, moment of inertia, type of engine and speed.—*A. E. G. Mitteilungen*, April, 1923.

*Developments and Requirements in Street Lighting.*—Two papers—"Recent Developments and Modern Requirements in Street Lighting," by H. T. Harrison, and "Street Lighting in Relation to Safety," by L. Gaster—that were given before the Illuminating Engineering Society in England are printed with the complete discussion that followed their presentation. The first paper discusses the devices employed to concentrate the light at angles slightly below the horizontal, in order to illuminate effectively the parts of the street most remote from the source. In such circumstances care is necessary to avoid glare, and the best solution of the problem is found in cases where the light is not only redirected but softened by the aid of globes and lanterns of diffusing glass. The proportion of light that can be allotted effectively to pavements and to the surfaces of buildings is also discussed. In the second paper reference is made to the intimate relation between conditions of permanent lighting and accidents in streets, and to the desirability of central authority to supervise the lighting of cities.—*Illuminating Engineer* (London), Vol. 26, No. 1.

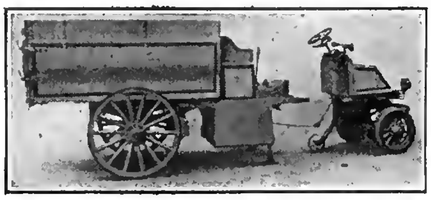
## Motors and Control

*Electricity in the Packing Industry.*—Very large increases in production have followed the introduction of electric drive in the packing industry. Hand methods are replaced by electrically driven machines, and the materials of manufacture are moved rapidly through the plants on conveyor systems propelled by motors. The author considers a typically electrified plant and shows results of careful planning.—*Electrical News*, May 15, 1923.

## Heat Applications and Material Handling

*Design and Construction of Electric Furnaces.*—L. P. BARTON.—In the design of the electric furnace there are three features that must be considered, namely, electrical, metallurgical and mechanical. In the practical working out of these points there are many different combinations available, several of which are discussed in detail by the author.—*Blast Furnace and Steel Plant*, May, 1923.

*Electrically Driven Street-Cleaning Vehicles.* — R. WERNEKKE. — Horse-driven watering wagons, sweeping cars and trucks can be easily electrified by removing their front wheels and substituting the motorized front drive shown in the accompanying illustration, consisting of two solid-rubber-tired wheels driven independently by two 4-hp. motors. The storage battery is hung under the rear part of the car. The controller, metering apparatus and steering mechanism are all contained in the removable front part of the car. It is thus possible to use the same drive for several types of vehicles, a feature which is of particular advantage in street cleaning. A speed of 12 km. to 20 km. per hour can be reached and a



HORSE-DRAWN TRUCKS ELECTRIFIED BY SUBSTITUTING MOTORIZED FRONT DRIVE

distance of 60 km., on the average, may be covered with one charge of the 310-amp.-hr. battery. Five speeds forward and three backward are provided on the controller. Two men can disconnect the front drive from one vehicle and mount it on another one within a few minutes. Charging requires 28 kw.-hr.—*Elektrische Betrieb*, April 10, 1923.

## Telegraphy, Telephony, Radio and Signals

*Radio Telephony from Trains.*—B. ROSENBAUM.—On the railway between Berlin and Hamburg an experimental radio-telephone equipment has been tested for some time and gives very satisfactory results. Any subscriber in Berlin can now communicate with a passenger en route to Hamburg and vice versa. An antenna of six horizontal wires is stretched out over the roofs of two adjoining cars, while a telephone wire carried on poles parallel to the entire length of the track represents the sending antenna. Connection diagrams illustrate the arrangement of the used apparatus.—*Jahrbuch der Drahtlosen Telegraphie und Telephonie*, April, 1923.

*Cracking Noises in Telephones.*—D. BÄHR.—The origin of sharp cracking noises in a telephone receiver has usually been assumed to be the hitting of the membrane upon the magnets or a heavy bending of the membrane. After a series of tests the author came to the conclusion that this assumption is not fully true and that these noises may be also caused by electrodynamic or condenser action of the coils themselves. Removing the membrane from a receiver and replacing the cover, the author claims that he could still hear a cracking noise, though of fainter character. — *Elektrotechnische Zeitschrift*, May 3, 1923.

*A Decimal Classification of Radio Subjects.*—The whole subject of radio communication is put in its proper place in the Dewey decimal classification—621.384. It is suggested that in a purely radio library these figures be abbreviated by the use of the letter "R" as a prefix for the numbers which designate the divisions of the subject. An abbreviated classification is provided for the use of small libraries or collections, and an alphabetical index enables one to refer readily to the classification number of any subject desired.—*Circular No. 138 of the Bureau of Standards.*

*The Pallophotophone.*—C. A. HOXIE.—A description of this device may be found in the ELECTRICAL WORLD, March 24, 1923, on page 691. The original paper was presented at the midwinter convention of the A. I. E. E.—*Journal of the A. I. E. E.*, May, 1923.

## Electrophysics, Electrochemistry and Batteries

*Electric Battery Locomotives for Surface and Underground Haulage.*—An abstract of a paper read by T. M. McGlashan before the Association of British Mining Electrical Engineers. The author discusses the two classes of locomotives—that is, those for surface haulage and those for underground haulage. These he subdivides into the trolley-pole type, the battery or semi-contained type and the combined trolley and battery type. Although there is practically no limitation to either the battery type or the trolley type for surface haulage, it is otherwise with underground haulage, where the risk of sparking in gaseous mines has to be avoided. The author also discusses the development and operation costs of underground locomotives.—*Electrical Vehicle* (London), April-May, 1923.

## Traction

*Main-Line Electrification in Italy.*—F. A. SHEPLEY.—The program now under way contemplates the electrification of all main lines by 1926. Much of this work has already been completed, but there still remains about 2,810 miles of line to be electrified. On the lines already electrified the author gives an account of the rolling stock, sources of power supply, form of generating units and power plants, system of overhead conductors, consumption of energy, etc. Comparisons between various types of locomotives and between steam and electrical operation are also made.—*Electric Traction*, May, 1923.

*Electric Railroad Ticket Printer.*—SIEMENS.—The article is a description of a fully automatic, electrically driven machine which prints railroad tickets at the instant of demand. The ticket agent has a small metallic plate for each station on the road, on one side of which is fastened an electrotype bearing the name of the starting point and the destination, the distance in kilometers between the two and the class of car. On the other side of the plate are a number of holes in some of which pilot pins are placed, their number and position representing the price of the particular transportation. The driving motor of the printer consumes about 180 watts during the actual printing and 120 watts running idle.—*Siemens Zeitschrift*, May, 1923.

# News of the Industry

Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men

## Thirteen Hundred Register at Swampscott

**President Jewett Deals with Increasing Complexity of Engineering Society Activities—Discussion on Differences Between Sectional and National Viewpoints—Entertainment**

IF ANY proof of the popularity of the summer convention of the American Institute of Electrical Engineers is needed, the convention held at Swampscott, Mass., this week should allay any doubt. Almost thirteen hundred had registered by Wednesday evening, the second day of the convention proper. The morning meetings were unusually well attended and of real value and interest; the afternoons were devoted to sports and inspection trips, and the evenings, containing both professional profit and entertainment, gave a good balance to the day. Members and guests were all enthusiastic.

On Monday the section delegates held the floor, discussing local and regional problems. A complete resurvey of the Institute's technical activities is in progress, and by 1924 it is expected that a report will be ready with recommendations. President F. B. Jewett declared that it might be desirable to supplement the sectional meetings of the Institute by regional meetings on account of the wealth of material now available for presentation in papers and for discussion.

President-elect Harris J. Ryan pointed out how the A. I. E. E. is helping the engineer to keep the country moving. Professor Ryan touched upon the value of a continental power network as a factor in creating a greater and a happier nation.

### Local and National Viewpoints

The reading by Chairman A. W. Berresford of a proposed clause qualifying the authority of A. I. E. E. sections' utterances in relation to public affairs precipitated a lively discussion. The advocates of the clause urged that without its use the public would frequently be misled into thinking that the views set forth represented the A. I. E. E. as a body and that conflicts between local and national viewpoints might result. The opponents, on the other hand, declared that if the clause were accepted, the action of any section on local matters of public significance would be without weight. A committee was appointed to draft a new clause upon which general agreement might be reached, and its report, which was accepted, was that a preamble be included in all public utterances by sections to the effect that, as the A. I. E. E. is a national organization, the opinion, or recommendations expressed represent only the views of the individual members of the section making the utterance.

Three other motions were passed. One was a recommendation to the board of directors that an alternative method of transferring members from one grade to another be considered. A second was that one meeting of district executives each year be made mandatory and that their expenses be paid from the general fund. The last was a recommendation to omit mathematics from *Journal* articles and publish mathematical articles in full, but in separate pamphlets, which could be mailed, separately from the *Journal*, to any one desiring them, and would also be included in full in the *Transactions*, the *Transactions* being made available at nominal charge or possibly supplied without cost.

Methods by which sections are endeavoring to create the greatest benefits from their meetings were also extensively discussed. Among the ways mentioned were having good speakers give the same address before different sections in rotation, preparing programs for an entire year in advance, offering prizes for the best papers presented, catering to operating engineers, and holding "engineer days" at universities.

E. E. F. Creighton mentioned the fact that the national organization is considering the engagement of a liaison man, who will be the secretary of the meetings and papers committee, to coordinate activities of committees and sections. The possibility of engaging consulting editors for the *Journal* was also mentioned.

### President Jewett's Address

The conditions under which all engineering organizations are operating are becoming more and more complicated by the increasing number of societies, the duplication of certain activities and the inextricable mass of relationships, Dr. F. B. Jewett asserted in his annual address on Tuesday. It is imperative to determine anew the guiding principles which should prevail and then tackle the problem of enforcing these principles. Since it is the purpose of national organizations to improve the status of engineers, they should deplore any short-cut royal roads to success. Dr. Jewett re-emphasized the fact that there is a growing need for engineers in public affairs to draw unbiased conclusions from ascertainable facts. He concluded by expressing the belief that executives in the engineering field will be increasingly drawn from technical colleges in the future, but they must also have business acumen and the ability to lead and direct men.

The papers scheduled by Dr. C. P. Steinmetz, J. L. R. Hayden and W. N. Eddy, and D. M. Simons on Tuesday were well received. On Wednesday the account of the new Weymouth station by I. E. Moultrop and Joseph Pope aroused much interest, as did the other technical papers presented.

### Fourteen Presidents in Line

The president's reception Tuesday evening was notable for the number of Institute past-presidents in line. Besides President Jewett and President-elect Ryan, there were Past-presidents Elihu Thomson, A. E. Kennelly, Carl Hering, C. F. Scott, P. M. Lincoln, William McClellan, A. W. Berresford, E. W. Rice, Calvert Townley, R. D. Mershon, D. C. Jackson and C. P. Steinmetz. Secretary F. L. Hutchinson was also in line. Most of them were accompanied by their wives. Dancing followed the reception and was as usual a feature of each evening.

On Wednesday morning there was a demonstration of life saving by the Coast Guard crew of the Nahant station. Tuesday afternoon Prof. Vladimir Karapetoff gave a popular demonstration of his new kinematic device built to explain the Einstein theory. Wednesday afternoon Prof. C. E. Magnusson gave a talk illustrated with colored stereopticon views of the State of Washington. Colored motion pictures and orchestra music from Boston broadcasted by the Public Service System were evening features. There was brilliant and decorative illumination each evening accompanied by a demonstration of a 30-kw. incandescent lamp. Automobile drives, boat rides, golf, tennis, bridge and similar entertainment helped make the entire convention week enjoyable.

### Coming Meetings

The plans for future conventions contemplate, besides the fall meeting at Del Monte, Cal., in October, a midwinter meeting at Philadelphia at which railroad electrification will be a topic of prominence. It is expected that a spring meeting will be held in Atlanta or Birmingham and the next summer convention in the Great Lakes district, provided suitable accommodations can be obtained.

## Southern Men Reorganize

### Water Power Conference Adopts New Constitution Providing for Three Main Bureaus

A MAIN feature of the annual meeting of the Southern Appalachian Water Power Conference at Asheville, N. C., on Monday to Wednesday of this week was the adoption before adjournment of a new form of constitution designed to develop a closely knit organization. The new policy provides for an organization embracing state public utilities commissions, public utility companies, engineers, bankers, chambers of commerce and industrial or commercial interests concerned with the development, utilization, operation and regulation of the natural resources of the Southern Appalachian States. The organization plan provides for the establishment of three bureaus with a full-time director in charge who will organize the personnel. This director will report to an executive committee, which will carry out through him any specific recommendations of the conference.

#### THREE BUREAUS PROVIDED

A Bureau of Public Relations will be established to effect a more harmonious relation between public utilities, public service regulatory bodies and the general public. A Bureau of Industrial Development is provided to furnish a clearing house for accurate information relative to the location of developed and undeveloped power, and a Bureau of Research is recommended to provide a means of compiling information relative to the scientific facts needed in the development of natural resources.

A number of addresses were made covering every phase of the water-power resources of the South and the essentials for their development to the best advantage. The conference went on record as favoring forestry protection. It also condemned legislation proposed in several states to prohibit the transmission of power to neighboring states.

Assistant Secretary of War Dwight Davis, in an address prepared for the conference, said that consideration of the water-power possibilities and supplementary coal deposits in the Southern Appalachian region indicated promise of great industrial development within the next decade. He urged that peace-time development should keep in view possible war-time emergencies, stressing the necessity of co-ordination and flexibility of distribution systems.

Executive Secretary O. C. Merrill of the Federal Power Board contributed a paper on "Some Popular Fallacies Concerning Power Development," dealing especially with cost of development and distribution of operating costs.

H. L. Wills of Atlanta was elected president of the reorganized Southern Water Power Conference; Col. Edgar Jadwin of Charleston, S. C., vice-president; J. A. Switzer of Knoxville, Tenn., secretary; Thorndyke Saville of Chapel Hill, N. C., treasurer, and Dr. Joseph Hyde Pratt of Chapel Hill, chairman of the executive committee.

## Secretary Work Forces A. P. Davis to Resign

Arthur Powell Davis, director of the United States Reclamation Service since 1914 and for eight years previously its chief engineer, has at the request of Secretary of the Interior Work tendered his resignation and has been succeeded by D. W. Davis, formerly Governor of Idaho, who is not an engineer. According to report, the deposed director is a victim of politics, which is said to be intertwined with the question of federal construction of the Boulder Dam project on the Colorado River. Former Director Davis, during whose administration the Roosevelt, Elephant, Shoshone and other great dams were built, was an advocate of government construction and control at Boulder. This policy is said not to have pleased Colorado and California power companies interested in the development of the river. Another stand taken prominently by Mr. Davis was opposition to the proposed development at Diamond Creek, which is backed by Arizona copper interests.

## Ontario Government Overwhelmingly Defeated

The Drury government, which has been in power in the Province of Ontario since 1919, was defeated in general provincial elections on Monday by a landslide, the Conservative party winning seventy-five seats, the Liberal party sixteen, and the United Farmer-Labor Coalition party, of which Premier Drury was the leader, only twenty. G. Howard Ferguson, Conservative leader, will now form a government. Champions of the Ontario Hydro-Electric Commission claim that the result is a popular vindication of that body. The government had been responsible for the investigation by the Gregory royal commission, the results of which went to establish charges of mismanagement and waste on the part of the Hydro-Electric Commission. Sir Adam Beck, the chairman of the Hydro-Electric Commission, opposed the administration and was elected to the Legislature from the city of London by a tremendous majority.

A body known as the Ontario Municipal Electric Association sent out a questionnaire to candidates for the Legislature asking them to pledge themselves to two statements—the first that they were in favor of the policy carried out by the Hydro-Electric Commission since its inception, the second that they were in favor of municipal representation on the commission. According to a representative of the Municipal Electric Association, about 70 per cent of these pledges were returned, nearly all signed by the candidates. The answers were not, however, published in the press of Toronto, although the Mayor of that city is president of the association.

## A. M. E. S. Mark Advance

### New London Conference Records Progress in Simplification and a Closer Bond Between Manufacturers

A VERY decided advance in the cause of simplification in the electrical industry was recorded at the annual convention of the Associated Manufacturers of Electrical Supplies held at the Hotel Griswold, New London, Conn., from Tuesday until Friday of this week. William A. Durgin, chief of the Division of Simplified Practice of the United States Department of Commerce, whose address at the Electrical Supply Jobbers' Association's convention at Hot Springs, Va., last month was so enthusiastically received, was invited to appear before the manufacturers and interpret to them the purposes of simplification in industry and the methods by which Mr. Hoover's staff is endeavoring to assist this movement. Simplification was a conspicuous note throughout the program of the meeting.

In the absence of President S. L. Nicholson, who is abroad, William L. Thornley occupied the chair. In his written message the president stressed the fact that there has never been a time when there has been such great need for co-operation and co-ordination among the manufacturing interests of the electrical as well as other industries, owing to the number of regulatory rules that are now being promulgated throughout the country, and he advocated a closer union of manufacturers through the association to make possible an advancement of standardization, statistical knowledge and their common purposes and benefits.

S. I. Whitestone, controller of the General Electric Company, presented a paper on uniform accounting and urged the establishment of a bureau of cost methods which would promote the standardization of accounting practice within the industry. Action on this recommendation had not been reached at the time of going to press.

#### CLOSER ORGANIZATION EFFECTED

Definite steps were taken at the "general and annual meeting" of the association to perfect a closer organization of the manufacturing interests of the electrical industry. The A. M. E. S. has consisted in the past of a group of autonomous sections, each consisting of representatives of the manufacturers of similar products, all sections loosely joined in an association, but holding no joint meeting and engaging in practically no co-ordinated activity. Two years ago this association was combined with the Electrical Manufacturers' Club and the Power Club in joint membership with the Electrical Manufacturers' Council. Last year the holding of one joint meeting of the A. M. E. S. was instituted. This year's meeting has increased the prominence of open joint meetings and by a revision of rules has emphasized the character of the organization as representative of the broad manufacturing interests of the supply lines of the electrical industry.

## New Colorado Pact Idea

**Tri-State Commission for Lower Basin Suggested at Western Development Conference**

THE meeting of the Western Development Conference on Friday, June 22, marked the close of the intensive four-day convention of the Pacific Coast Electrical Association at the Fairmont Hotel, San Francisco. This conference has been made a regular feature of the association's annual convention, and the meeting this year was particularly interesting and well attended. Governor James G. Scrugham of Nevada deplored the fact that the Colorado River Basin states have not been able to get together on a plan for development. He suggested as a solution to the deadlock created by the refusal of Arizona to ratify the Colorado River compact the formation of a commission by the joint action of Arizona, Nevada and California to be given authority to issue bonds and proceed with power development on the lower river. Such a body would protect Arizona against the features of the compact to which she objects and would pave the way to an amicable settlement of the differences of the states concerned in power development in the lower basin. The commission proposed would not retail or distribute power but wholesale it to existing agencies.

Willis Booth, president of the International Chamber of Commerce and vice-president of the Guaranty Trust Company of New York, in speaking on "The Importance of the Pacific Coast in World Affairs," indorsed the plan of Governor Scrugham and said that the East considers the development of the Colorado River the most important factor in the growth of the West. Italy and other foreign countries, he said, have learned by experience that public ownership is not in the best interest of their development and as rapidly as possible are returning to private ownership of utilities.

At the election of officers on the last day of the convention L. M. Klauber of the San Diego Consolidated Gas & Electric Company was elected president, William Baurhyte of the Los Angeles Gas & Electric Corporation, first vice-president, F. A. Leach, Jr., second vice-president, S. B. Anderson, treasurer, and Samuel H. Taylor, secretary.

## Railroads Must Surrender Advantage at Coal Mines

The Interstate Commerce Commission has overthrown the long-established practice of the railroads of assigning cars to the mines which produce their fuel. This always has been a thorn in the side of the public utilities, which had not been allowed to use this advantage in securing their coal. Those opposed to the practice always have contended that it results in the public's paying a portion of the railroad fuel bill, because the operator of a mine who is assured 100 per cent car supply can afford to make a price to the railroad which is lower than the cost of production. It is contended that the abolishing of assigned cars will do a great deal toward stabilizing the production and distribution of coal in that it will force the railroads to provide storage.

## Canada to Contribute to World Power Conference

The government of the Dominion of Canada plans to take an active part in the World Power Conference, June, 1924, in London, England. As a result of its call on the Canadian Electrical Association, three of the five Canadian papers are to be presented by members of the association, as follows: "Transmission and Distribution of Electrical Energy," by Julian C. Smith, vice-president Shawinigan Water & Power Company, Montreal; "The Application of Hydro-Electric Energy for Public Utility Purposes," by P. T. Davies, commercial manager Southern Canada Power Company, Montreal, and "The Financial Aspect of Power Development in Canada," by Sir Herbert Holt, president Montreal Light, Heat & Power Company.

## Big Plant for Cincinnati

**Union Gas & Electric Company Plans to Erect New Power House at Cost of $12,000,000**

ANOTHER has been added to the many large generating stations now being planned or already under way in the Middle West by the announcement of W. W. Freeman, president of the Union Gas & Electric Company of Cincinnati, that before the end of the year plans will be completed for an additional electric power plant to be built in that city by his company, at a cost of $12,000,000.

Pointing out the development of the industry in Cincinnati, Mr. Freeman cited figures covering a period of several years. In 1921, he said, the company registered 14,000 new electrical consumers, in 1922, 20,000, and 7,500 during the first four months of 1923. Of the total number of consumers at the present time, reaching more than 100,000, Mr. Freeman said, 80 per cent have become customers in the past six years.

Details of construction for the new plant are not yet available. It is hoped to have the part to be built first in operation inside of three years.

# Canadians Discuss Accounting Problems

**With Commercial Topics, These Form Principal Theme of Montreal Convention, Which Is One of the Largest Ever Held by the Association—Technical Subjects Debated**

THE Canadian Electrical Association held its thirty-third annual convention at the Mount Royal Hotel in Montreal on Thursday, Friday and Saturday, June 21-23. It was probably the best-attended convention which this association has ever held, and it was made especially interesting this year, from the standpoint of accounting, by the fact that the National Accounting Section, N. E. L. A., executive committee held its meeting in Montreal on June 20 and its members remained over for the convention. Accounting was thus one of the principal topics. Intelligent commercial development was the subject to which most of one day was devoted, talks on residence and industrial lighting development being given.

In his presidential address on Thursday P. T. Davies, commercial manager Southern Canada Power Company, said, in response to the criticism that the association had heretofore devoted too much attention to technical matters, that more provision was made this year for commercial and accounting study, the Technical Section being left to run itself.

### PUBLIC OWNERSHIP

With reference to public ownership in Canada, Mr. Davies said:

"Your association, while insistent upon guarding the rights of its own member companies to live and fill a legitimate and protected place in our modern social structure, is quite satisfied that time alone will show to the owner of property in Ontario and also to the people at large the economic impossibility of operating for any length of time those necessities which history has again and again proved can only be run permanently by private agents.

"The association does feel that it is unfair for any governmental body, such as the Hydro-Electric Commission of Ontario, to escape the payment of the normal taxes incident to the operation of such a system by private ownership. The fact that the Hydro-Electric Commission in its operation pays neither income tax to the government of the country nor any provincial taxes whatsoever is benefiting the few customers in Ontario at the expense of not only the non-users in Ontario but also every other person in the Dominion of Canada. When this freedom from taxation is carried to the limit that the Hydro-Electric system pays no sales taxation on the appliances which it buys for resale, a legitimate ground for criticism is present among those dealers in Ontario who have to sell in competition with such merchandising outlets."

The public relations committee recommended a division of public relations work along lines now prevalent in the N. E. L. A. and pointed to the way the United States is outdistancing Canada in the matter of customer ownership. John W. Gilchrist, speaking to this point, on invitation, said that the experience of the Commonwealth Edison and associated companies proved that

customer-ownership activities, meant no lowering of dignity, as originally feared, but that on the contrary they were one of the greatest elements for good public relations as well as for financial stability. From his experience Mr. Gilchrist advised: "Don't go at it in a half-hearted way. Don't depend alone on over-the-counter sales. Don't get discouraged at apparently early failure."

### Present-Day Accounting

At the meetings of the Accounting Section papers were presented corresponding to the reports of the N. E. L. A. but containing views and expressions particularly applicable to Canada. The principal speaker was H. M. Edwards, auditor of the New York Edison Company, who gave an impressive talk on the history and work of the Accounting Section of the N. E. L. A. Mr. Edwards' address was responded to by A. Monroe Grier, former president of the Canadian Electrical Association. The sessions were also addressed by J. W. Gilchrist, vice-president of the Commonwealth Edison Company, Chicago; W. A. Jones, chairman National Accounting Section, N. E. L. A., New York City; William Schmidt, Jr., former chairman National Accounting Section, and Fred R. Jenkins, accounting education committee, N. E. L. A.

The great interest shown in the Canadian Accounting Section this year is largely due to the persistent efforts of W. Paxton Little, its chairman, who has given a great deal of time to stimulating its activities. Mr. Little is also vice-chairman of the National Accounting Section, N. E. L. A.

In the discussion of the accident prevention committee report there was a plea for greater executive support of this work. Point was made of the fact that there are many by-products of accident prevention work in public relations and in money, aside from humanitarian motives.

F. M. Feiker at the Thursday luncheon showed the opportunities—the necessity as well—for group or association activity in solving many of the present-day problems resulting from a complex civilization with its greater demands and higher costs.

### Technical Sessions

As usual, the reports of all committees were printed in advance and available for study before the meetings. In the discussion of the electrical apparatus committee report P. T. Davies said he felt that ideas of distribution to the customer would eventually have to undergo radical changes. As a suggestion, for example, he mentioned the idea of 2,200-volt or 4,400-volt distribution to the customer with concentric cables—the outer grounded sheath being one conductor—with voltage regulation on the customer's premises. He also predicted a commercial development of from 500 kw.-hr. to 1,000 kw.-hr. per month to the average customer as a load to be reckoned with in technical development of distribution systems.

In discussing the meter committee report, it was brought out that records show meters from smaller companies to be more frequently in error than those of larger ones. It was also stated that meters mounted outdoors so that they are subjected to the extremes of heat and cold are generally affected in such a way that they get slow.

Wills Maclachlan, discussing overhead lines, said trained linemen are getting more and more scarce, that simple things are not understood by linemen or bosses, and that one problem the companies have is to educate linemen.

### Dinner-Dance

The dinner-dance on Thursday evening was an elaborate and well-attended affair. John W. Gilchrist, in his address, dwelt on the three points of public relations, customer ownership, and possibilities for the sale of appliances. The first included employee relations, which should come first; the second put a stop to government ownership theories, and the third should be developed by the trustees of electrical supply as a duty to the public.

"We are not doing what we ought to do," said Mr. Gilchrist, "from the standpoint of our shareholders and the greater obligation to the public. We do not appreciate the extent to which these devices actually give strength and health and serve the welfare of our nation." Mr. Gilchrist then pleaded for a cost analysis and a profit basis of carrying on merchandising business. On the small scale of years ago losses could be charged as promotion, but not on a large scale. He pointed out the character of men on the merchandising policy committee of the N. E. L. A. as indicative of the magnitude and importance of the problem as viewed by the industry.

### Residence Lighting

The Friday morning session was devoted largely to residence lighting as a means of increasing business and interpreting electric service to the public. M. Luckiesh interpreted the N. E. L. A. committee report on this subject, showing how to use it, and further elaborated on methods of residence lighting, illustrating his talk with lantern slides. Mr. Luckiesh suggested that electrical men watch real-estate plans and sales and get in on the ground floor of residence home-lighting plans.

W. H. Johnson, president-elect N. E. L. A., at luncheon Friday, said the past year of the association was its most successful one and had been largely devoted to public relations and customer ownership. One reason why the good work of the electrical industry is not fully recognized is that it is so well done. Publicity, not propaganda, is needed, and more of it. Mr. Johnson gave great credit for the present position of the central-station industry to the work of the N. E. L. A. and urged continued and greater co-operation between the central stations of the United States and Canada.

L. A. Hawkins of the General Electric research laboratory warned against the excessive use of the word "research" and said the industry must plan to go forward with fundamental research and not slip back to the pre-war condition of calling "experimenting" research. He said that about 30 per cent of the General Electric Company's business was on things which originated in the General Electric research laboratory.

Mr. Hawkins traced the research which led to the present large vacuum tubes and predicted the future transmission of energy by tube-controlled high-tension direct-current lines. He emphasized that all research must "keep its touch with firm earth" and have sufficient contact with practice to give it strength and guidance.

At the Friday afternoon session S. G. Hibben talked on industrial lighting, illustrating his remarks by experiment and lantern slide. The possibilities of the development of this business are entirely impossible of prediction for present intensities are as yet so far below daylight that it is not practicable to tell where artificial light should stop, Mr. Hibben said. There is much to be done also in methods of application.

Street and highway lighting and shop-window lighting were also discussed.

### Electrical Veterans' Night

An innovation in the way of an "electrical veterans' night" was staged on Friday evening, at which a large number of those twenty years or more in the electrical business took a prominent part.

Saturday morning was devoted to an analysis of how to get insurance rate reductions as outlined by the N. E. L. A., to customer ownership and to meter seals. The attempt is being made to extend the period at which customers' meters must be sent to the government for check from the present period of five years to ten years.

## Canada to Separate Lighting and Heating Figures

According to President P. T. Davies of the Canadian Electrical Association, "cost of living" figures in Canada will no longer contain misleading figures on lighting as an element of cost of living. Representations were made and data presented to the Minister of Trade and Commerce which persuaded him to separate out the item of lighting from heating, so that in the future, instead of the items being combined and showing apparently, for example, that lighting in 1923 is 188 per cent of 1914 prices, they will show a decrease in the average cost of lighting per family during this period. The Minister has announced that he has the necessary information and that his statistical department is at work on the average figures.

## Commission Prevents Link

**Alabama Power May Not Build Line from Huntsville to Muscle Shoals—Postpones Action on Lock 17**

NOT only has the Federal Power Commission, as reported last week (page 1486), postponed action on the issue of a license to the Alabama Power Company for its proposed development at Lock 17 on the Black Warrior River, near Tuscaloosa, but the Alabama Public Service Commission has indefinitely postponed consideration of the power company's petition for permission to build a hydro-electric plant there. The commission has also denied to the company the right to erect a transmission line from Huntsville to the government steam plant at Muscle Shoals.

The commission based its action on the Lock 17 petition on several grounds. It held that the power company had failed to show how much it proposed to pay the government for the power to be developed and that no detailed survey had yet been made of the Warrior River. Piecemeal development of the power in the state should not be permitted, the board said, adding that it had been advised that the Legislature at the coming session will devise a comprehensive policy on water-power development.

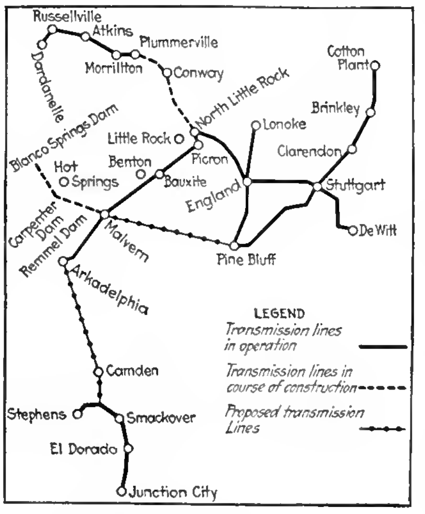
In denying the petition of the power company to construct the Sheffield-Huntsville transmission line, which (as shown in the ELECTRICAL WORLD for May 5, page 1052) would give the company a transmission "ring" from Muscle Shoals to Mitchell Dam and back by Anniston and Huntsville, the commission contended that the power company does not own the government steam plant at Sheffield or the transmission line from Gorgas to Sheffield. The commission said that the government might end its contract with the Alabama Power Company for the Sheffield plant and the Gorgas line. On this account it could not allow the company to spend more than $600,000 in building the proposed line. The commission maintained that the company should give Huntsville power from some other source, but did not suggest a way. Huntsville's power needs would not be solved by erection of the line, according to the utility board.

## Last Unit of San Francisquito No. 1 Cut In

On Sunday, June 10, the last 16,000-hp. generating unit of the Los Angeles municipal power plant No. 1 in the San Francisquito Canyon went into service. The new unit, constructed at a cost of more than $300,000 from the revenues of the municipal bureau of power and light, marks the limit of hydro-electric development along the Los Angeles aqueduct, the improvement bringing No. 1 plant to a generating capacity of 58,000 hp. The total capacity of the five municipal power plants, it was announced by Chief Electrical Engineer E. F. Scattergood of the power bureau, now is 115,000 hp. Despite the additional supply, the Bureau of Power and Light will still be forced to purchase more than 30 per cent of the electricity the city distributes to its consumers.

## Progress of Arkansas Light & Power Company

Work on the Remmel Dam, on the Ouachita River, between Malvern and Hot Springs, Ark., has, as already announced in the ELECTRICAL WORLD, been begun by the Arkansas Light & Power Company, Pine Bluff. This company, under the guidance of President H. C. Couch, is now operating ten central power stations, more than 500 miles of transmission lines, thousands of miles of distribution systems and serving growing cities and towns and hundreds of farms in sixteen counties containing one-quarter of the population of Arkansas.



TRANSMISSION SYSTEM OF ARKANSAS LIGHT & POWER COMPANY

The Remmel Dam will be 50 ft. to 60 ft. high and 900 ft. long at the crest. The power station at this dam will produce 15,000 hp. The cost is estimated at $1,500,000. Two other dams and power stations are provided for in the ten-year program, which contemplates converting the water power of the Ouachita River into 120,000 hp. of electrical energy, incidentally controlling floods in the river. The storage capacity will be equal to 1,000,000 acre feet, equivalent to a lake 70 miles long by one mile wide. The estimated cost of the entire program is placed at $15,000,000.

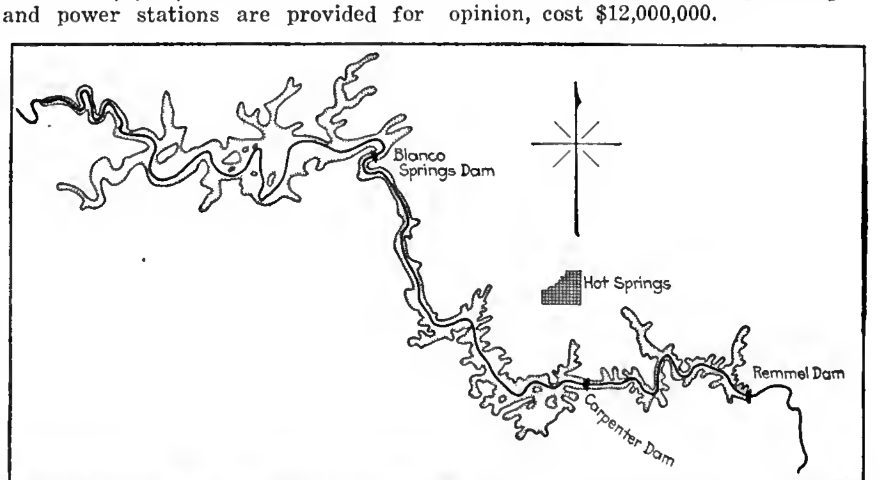
The second dam and power station will be constructed at what is known as the Carpenter Dam site, a few miles south of Hot Springs, and the third dam and station at the Blanco Springs site, a few miles northwest of Hot Springs. The Carpenter Dam will have a height of 100 ft. and a length of 1,340 ft. The Blanco Springs Dam will be 130 ft. to 175 ft. high and 905 ft. long.

## Detroit Council Votes to Buy Four 20,000-Kw. Units

The Detroit City Council has rejected the proposal of the Detroit Edison Company to furnish power for the street railway and public lighting on the east side under a ten-year agreement, provided that the city limited its own proposed municipal power plant to three turbo-units of 20,000 kw. rating each. Instead, the Council voted unanimously to reaffirm its approval of the letting of a contract to the Westinghouse Electric & Manufacturing Company for the installation of four turbo-generators of 20,000 kw. rating each in the new power plant to be built by the city at the foot of Morrell Street. The contract calls for a total expenditure of $1,254,000, to be paid for out of a twelve-million-dollar bond issue.

The Edison company's proposal was to furnish power to the city at a suggested cost of 1.3 cents a kilowatt-hour, the ultimate rate to be fixed by the Michigan Public Utilities Commission.

The city's requirements for power now closely approach 60,000 kw. It is the intention to hold one of the Westinghouse units in reserve. The new plant is to be so designed as to admit of expansion. It is to be completed in 1925, and will, according to expert opinion, cost $12,000,000.



PROPOSED DEVELOPMENT OF OUACHITA RIVER BY ARKANSAS LIGHT & POWER COMPANY

## F. A. E. S. Will Be Represented at World Power Conference

Growing participation by engineers in public affairs was strongly evident at the June meeting in St. Paul of the executive board of the American Engineering Council of the Federated American Engineering Societies. General round-table discussion revealed that local groups in many sections of the country are taking a constructive part in solving community problems. This local effort embraces traffic, smoke abatement, water supply, city planning, state and municipal legislation relating to engineering matters and related subjects.

The committees on transportation, coal storage and a proposed registration law for engineers reported and will continue their work along the same progressive lines. A request was received from the Cleveland Engineering Society asking that the federation support the movement for the appointment by Congress of a technical commission to make a thorough study of the engineering and economic phases of the proposed St. Lawrence waterway before making any definite decision regarding the project.

The executive board voted to participate in the World Power Conference to be held in London in 1924 and authorized President Cooley to appoint representatives. It accepted an invitation from the Chamber of Commerce of Rochester, N. Y., to hold its next meeting there during the first two weeks in October.

## Lynn Company to Sell Railway 9,000,000 Kw.-Hr. a Year

The Eastern Massachusetts Street Railway Company has entered into a contract with the Lynn Gas & Electric Company under which the street railway will be supplied with all of the electrical energy required for the operation of its electric cars in its Lynn division, consisting of about 60 miles of track in Lynn, Saugus and Swampscott.

The lighting company expects to begin to supply electric power under the contract not later than Feb. 15, 1924. The power will be in the form of 13,200-volt alternating current, transmitted through about one mile of duplicate underground cables to the new substation of the railway company, to be erected at the center of direct-current distribution, near the corner of Union and Washington Streets, Lynn. The substation, which will cost $125,000, is to house three 1,500-kw. standard rotary convertible units and control equipment, with room for an additional 1,500-kw. unit. It will be manually operated.

The lighting company will realize material savings in fuel economy made possible by better plant and machine load factor, reduction in labor costs per unit of electrical energy sold and reduction in average distribution losses, the block of 9,000,000 kw.-hr. per year being sold to the railway company, at the lighting company's station. The railway company will be able to realize more fully the economy of light rolling stock resulting from taking energy from a source where the cost is proportional to the amount of energy needed and used. It also will profit from the reduction in unit costs due to improvement in fuel economy and the reduction in cost of station labor due to the combination of the two plants. The contract was negotiated by Macomber & West, engineers, Boston.

## Fuel and Public Relations Ohio Men's Topics

Steam generation by powdered fuel and with mechanical stokers, public relations and new-business problems will dominate the program of the Ohio Electric Light Association convention, which will be held at Cedar Point, Ohio, from July 10 to 13. The Wednesday morning session will be given over entirely to the East Central Geographic Division of the N. E. L. A., consisting of Ohio, Kentucky and West Virginia, and the afternoon to sports. On Thursday afternoon Newton D. Baker, ex-Secretary of War, will deliver an address. The annual banquet will be held Thursday evening. The tentative program follows:

TUESDAY, JULY 10

*Afternoon.*—President's address, report of secretary-treasurer, report of executive committee.

WEDNESDAY, JULY 11

*Morning.*—"United Utility Effort," Donald McDonald, Louisville Gas & Electric Company; "How a Public Utility Company Can Promote Sound Public Relations," Victor H. Morgan, Cleveland; "Utility Development in West Virginia," A. Bliss McCrum, secretary Utilities Association, Charleston, W. Va.

THURSDAY, JULY 12

*Morning.*—"Future Emphasis in Public Utility Regulation," Prof. C. O. Ruggles, Columbus; report of new-business co-operations committee, C. G. Eichelberger and A. C. Shepherd; "Merchandising Wiring," G. H. Miller; "Merchandising Light," A. E. Turner; "Merchandising Appliances," C. S. Beardsley.

*Afternoon.*—"League of Nations or a World Court?" Newton D. Baker; report of meter committee, J. L. Wright.

FRIDAY, JULY 13

*Morning.*—Report of transmission and distribution committee, R. R. Krammes; report of station-operating committee, J. J. Dolan; "Mechanical Stokers and the Future of Burning Coal," C. F. Herrington; "Generation of Steam by Powdered Fuel," Joseph G. Worker; election of officers.

## Ford May Generate 25,000,000 Kw.-Hr. a Year at Ironwood

The Ford Motor Company of Detroit has applied to the Wisconsin Railroad Commission for a permit to construct, operate and maintain a dam in the Menominee River in Florence County, Wis. The dam would be 400 ft. long and 30 ft. high, designed to provide water power to develop 25,000,000 kw.-hr. of electrical energy annually for the Ford plant in northern Michigan. The site is 3 miles west of Ironwood, Mich., which is the boundary between Wisconsin and upper Michigan.

## Southern Power Suit Off

**Dispute with North Carolina Cotton Mills Is Settled, the Latter Paying Rates Asked**

A JUDICIAL order in the United States District Court in Greensboro, N. C., signed by Judge James E. Boyd, brought to a close the long-pending litigation between the Southern Power Company and sixteen cotton mills in North Carolina. As previously related in the ELECTRICAL WORLD, the Southern Power Company sued the mills for sums alleged to be due for electrical energy at rates fixed by the North Carolina Corporation Commission and many of the mills refused payment, alleging breach of contract and that the new rates were excessive. Judge Boyd's order, which explains the basis of settlement, reads:

"The plaintiff [Southern Power Company], through its attorney, W. S. O'B. Robinson, Jr., having come into court at this, the June term, 1923, and announced that the defendant [the mill company in each case] has fully paid the alleged indebtedness for the recovery of which this action was instituted, and that all matters of difference between the parties have been settled, and having consented that this action be dismissed at the cost of the plaintiff, except that no attorney's fees be taxed in the costs, it is adjudged that the plaintiff's action be and the same is hereby dismissed and that the plaintiff pay the costs to be taxed by the clerk, but that no attorney's fees be included in the costs."

Although there were only sixteen defendants in the action affected by this final decree, a total of twenty-six suits were settled, there being in some instances two suits against the same defendant company.

## Weaver's Books on French History Go to Princeton

Among the many interests of the late W. D. Weaver, long the editor of the ELECTRICAL WORLD, was the study of the French Revolution, and his collection of books and pamphlets on this period of history was an extremely valuable one, comprising three thousand or more entries. In the later years of his life this collection was housed in Mr. Weaver's residence at Charlottesville, Va., where he delighted to show it to his friends and visitors.

The collection has just been purchased by James H. McGraw, president McGraw-Hill Company, and by him presented to Princeton University for incorporation in its library. In making the donation to Princeton through President John Grier Hibben, Mr. McGraw said that he was prompted by his high regard for Mr. Weaver and by a motive to make the valuable collection available to students of Princeton and "to show my appreciation of what Princeton University has done for the higher education of the young men of our time."

# Public Service, Industry and Business

### These Three Fields for the Engineer Are Discussed Before the S. P. E. E. at Ithaca—Educational Specialization by Function as Well as by Industry Advocated

OTHER proceedings of the annual meeting of the Society for the Promotion of Engineering Education, held at Cornell University, Ithaca, N. Y., last week, besides those summarized in the ELECTRICAL WORLD for June 23, included a paper by T. H. MacDonald, chief of the Bureau of Public Roads, Washington, D. C., on "The Engineer as a Leader in Public Service," in which he said that, although the public does not hastily impose authority on any class or group of men, but waits for demonstrations of competency, the accomplishments of engineers have changed the conception of government and modified the ways heretofore used to support human existence. Regulatory commissions he termed a fourth branch of the government, constantly engaged in constructive investigation and research.

"The Engineer as a Leader in Transportation" was the topic of E. H. Lee, chief engineer Chicago & Northern Indiana Railroad, who told how human relationship became important and is now the primary factor in railroad development.

#### THE ENGINEER IN INDUSTRY

Dealing with "The Engineer as a Leader in Industry," O. S. Lyford of the National Industrial Conference Board, whose paper was the result of the work of a joint committee, said that engineers should be leaders because they have a well-considered method of attack and a scientific mind. Three questions presented themselves: Does industry need more or fewer engineers than are now available? What kind of education should they have? What is the responsibility of the industry in their work? Final answer can be had only through co-operative effort. One big factor will be the keen competition of European countries when they emerge from the present political, financial and industrial slump.

The percentage that the college men bear to the adult males of the nation is, Mr. Lyford pointed out, very small. We have 129 engineering schools with 53,000 students enrolled. They form an essential part of industry, and industry is showing a growing tendency to select and use them. A study of graduates who have been out of Rensselaer, Harvard, Lehigh and Stevens for five, ten, twenty and twenty-five years shows a decided shift from engineering work to other work as years elapse. Some of the shift is due to failure, but most is due to a logical change in occupation and promotion to positions of leadership and responsibility.

The following recommendations of a group of executives were embodied in Mr. Lyford's paper: (1) Methods of selection should be improved; (2) better fundamental training is needed and not specific training; (3) broader training should be given; (4) more practical training for instruction should be required, and (5) more practical training should be incorporated with the theoretical, preferably during the course. The paper was discussed by Dean A. A. Potter of Purdue, Dean P. F. Walker of Kansas and Prof. P. M. Lincoln of Cornell.

#### THE ENGINEER IN BUSINESS

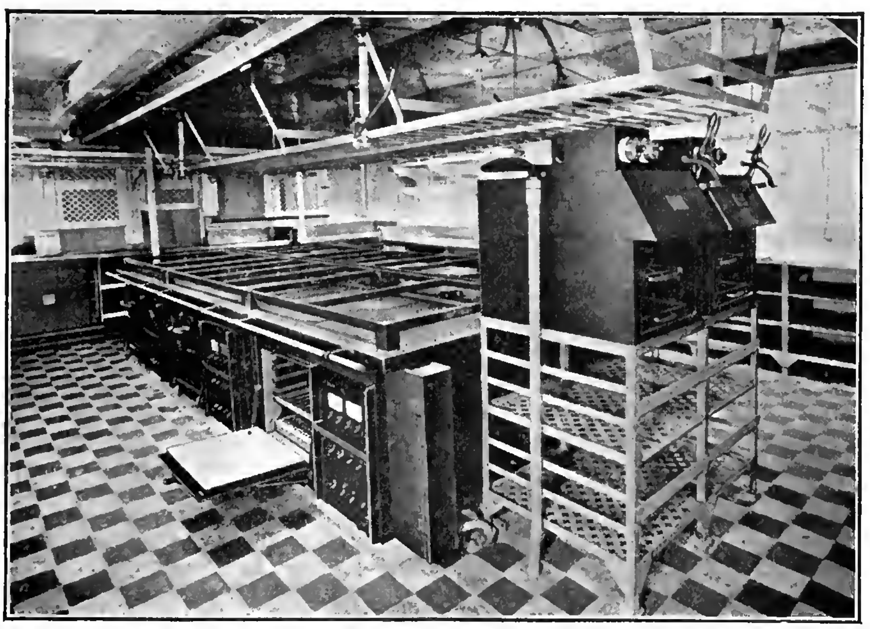
W. E. Wickenden, assistant vice-president American Telephone & Telegraph Company, spoke on "The Engineer in Business," and read a report from a committee which held that a broader equipment must be possessed by engineering teaching staffs and that economic and physical analyses should be a larger element in the pedagogical process. The broad viewpoint of engineering must, the report said, be the engineering and economic adaptation of science for industrial and social well being. The place of the engineer as a leader in business is not assured, Mr. Wickenden asserted, although his leadership in industry is assured. The business world is dominated by considerations which offer handicaps to engineers, and leaders cannot be produced in standardized lots by schools. They possess no standardized qualities. He cautioned the educators about attempting to train leaders directly through any college course.

#### FUNCTIONAL TRAINING

Prof. Edward Bennett of the University of Wisconsin presented a carefully reasoned paper on "Engineering Courses for the Functional Rather than the Industrial Divisions of Engineering." He made a plea for the recognition of the necessity for a new type of specialization in engineering education, grouping the functional divisions under the basic classifications "sales," "management," "supervision," "design" and "research," which all alike should run through the industrial engineering divisions—civil, mining, mechanical, electrical, chemical, etc., each with its various subdivisions. "The distinctive general feature of the functional engineering courses," said Professor Bennett, "should be the separate provision for the needs of men of superior aptitude and for those of moderate aptitude by profoundly technical and moderately technical treatments of the different branches of science, particularly of the introductory mathematics and physics of the first two years."

Prof. H. E. Dyche, head of the department of electrical engineering of the University of Pittsburgh, discussed

## Electric Cooking and Galley Equipment on Leviathan



THE accompanying photograph shows an electric range and broiler in the Ritz-Carlton galley of the steamship Leviathan, which will leave on its first trip to Europe in its reconditioned form as an American passenger ship on July 4. The service in the Ritz-Carlton galley is completely electric, consisting of six Edison hotel-type heavy-duty ranges, two smaller-size broilers and one No. 200 baking oven. In the dining rooms electrically heated service tables keep the courses at right temperatures while meals are being served, reducing the waiters' trips. All serving pantries and bars are equipped with a small griddle or two-burner hot plate for serving. Without electric equipment this class of service is impossible on board ship.

The entire cooking and galley installation on the Leviathan is the product of the Edison Electric Appliance Company, Chicago.

'Fundamentals" as applied to electrical engineering courses, giving a symposium of opinions expressed by many electrical engineers and executives.

Dean Perley F. Walker, dean of the School of Engineering of Kansas University, was elected president of the society for the coming year.

# Divisional Work Praised at Minneapolis

### Its Advantages Find Recognition from Delegates to North Central Geographic Division, N. E. L. A.—Distribution Losses, Rural Lines and Safety Discussed

HOW the best brains of the industry have been made available to all central-station men who care to avail themselves of the opportunities offered by the organization and work of the National Electric Light Association and its geographic divisions was recounted by L. O. Gordon of Albert Lea, Minn., in discussing the value of the North Central Geographic Division to operators of small plants before the convention of this division at Minneapolis held last week from Wednesday to Friday. Pointing out the opportunity that the small-plant operators have to come together in the geographic division meetings for a discussion of their individual problems and the way in which the work of all the national committees is brought directly to the members of the divisions, he expressed the opinion that attendance at the division meetings is of greater benefit to the small than to the large operators.

C. G. Hadley of Rochester, Minn., dwelt upon the work of the national association in the coal-supply troubles, the work of the accounting and rural lines committees and the public relations work as things that in themselves had returned more to the small-plant operators than the dues of the association had cost. Further discussion brought out the view that convention programs should be arranged to promote informal discussion of common problems among men unaccustomed to public speaking and discussion, and action was taken to arrange for such discussions at the next meeting.

Lee Boyer of Deadwood, S. D., thought that more attention should be given construction and operation. Public relations, he said, are relatively less important in very small communities because close personal contact with customers necessarily exists there.

#### Reducing System Losses

Pointing out that losses of energy up to 35 per cent were not uncommon in small distribution systems, D. M. Bunn of Minneapolis said that the three-phase, four-wire system meets distribution needs best and provides the greatest capacity per dollar invested. He criticised the common practice in minor plants of putting up too small copper and too many transformers of small capacity and recommended a careful study of territory so that future growth could be provided for and the practice of tacking on conductors and equipment without consideration of their effect on losses avoided. He gave an example of the difference between a two-wire No. 8 copper-wire secondary circuit which had been found in use in a small system and the three-wire No. 6 circuit that was substituted, losses between the transformer and the consumers' premises being reduced from 7.6 to 4.4 per cent. Mr. Bunn recommended reducing the number of transformers to as low a value as possible, using the larger sizes as a means of cutting the energy losses. The effect of poor power factor in causing losses was brought out, and the speaker cited instances in which the use of synchronous or static condensers had not only improved distribution conditions but had made actual savings to power customers who were purchasing energy under a rate with a power-factor penalty clause.

S. B. Hood called attention to the need of using induction regulators in securing economy. Lee Boyer characterized the use of No. 8 copper wire on overhead lines as a fallacy because of its lack of mechanical strength and said that care must be taken in the location of condenser equipment so that as far as possible the transfer of wattless current can be avoided. Oscar Gaarden questioned whether some of the uses suggested for condenser equipment could be justified, saying that the installation of such equipment was a matter of balancing the cost against the savings.

#### Electricity as a Plant Hazard

In discussing accident prevention C. B. Scott of Chicago said that, though an analysis of ten thousand accidents in central-station work had shown that only 9 per cent were due to electricity, this 9 per cent included 75 per cent of the fatalities, 70 per cent of the lost time and the same percentage of the cost. Switching operations, carelessness in killing and re-energizing lines and overloading of apparatus are, he said, principal causes of accidents. He criticised linemen for their frequent violation of fundamental safety rules and obstinate failure to use safety devices. Accidents were due 88 per cent to man failure and 12 per cent to condition of the physical property. Careful selection of men, constant preaching of individual responsibility and, above all, close supervision are the remedy.

Arthur Huntington of the Iowa Railway & Light Company told of the organization of the Committee on the Use of Electricity in Agriculture, in which the American Farm Bureau Federation. National Electric Light Association, American Society of Agriculture, Department of Agriculture and individual electric plant manufacturers are interested.

Prof. G. D. Shepardson of the electrical engineering department of the University of Minnesota urged co-operation between the electrical and agricultural interests, suggesting among other things a study of the use of electric trucks on the farm, refrigeration, irrigation in the non-irrigated sections of the country and the study of industries of the manufacturing type that might be developed in the rural sections as off-season occupations. Highway construction would better load factors on rural lines.

#### Farmer Has Right to Electricity

Prof. E. A. Stewart of the agricultural department of the state university said that the use of electrical energy by the farmer might not be profitable in all cases, but, regardless of this, the farmer is entitled to its use as a means of improving his living conditions. He said that the farmer must expect to pay the cost of the service and in a keen analysis of rate forms pointed out the weakness of the minimum-charge forms of rates, which, he said, either by a high minimum charge and a low energy rate or a low minimum charge and high energy rate discouraged the use of energy. Professor Stewart said that a fixed service charge and a low energy rate was the best means of building up usage. He criticised the lack of uniformity in building lines and giving service, said that this had created distrust in the mind of the farmer and called attention to a form of contract being worked out in the department of agriculture in the state university.

C. A. Atherton, chairman of the rural electric service committee of the American Society of Agricultural Engineers, said that the discussion of the problem among so many groups was promising and brought greater possibilities of a solution.

J. E. Davidson, vice-president of the National Electric Light Association, gave a summary of the work of the association during the past year and told of the convention in New York. Henry S. Ives of Chicago, speaking for the insurance interests, took a strong stand against government control of business. N. W. Kingsley of the Northwestern Bell Telephone Company gave a chalk talk on the causes of and remedies for inductive interference. W. J. Canada, engineer of the National Electric Light Association, also spoke on this subject.

The convention was the largest held in the four years of the existence of the division, 405 being registered. R. M. Howard of Winona, Minn., was elected president for the coming year, with G. O. House of St. Paul as vice-president. Recommendation was made to the executive committee that a permanent secretary be engaged. It was also recommended that a committee on public utility information be formed.

## New York Electrical Society Seeks Sustaining Members

To cover the increased expenses which have lately confronted the New York Electrical Society it is proposed by constitutional amendment to establish a class of "sustaining members" which will be recruited from individuals, companies, firms or associations "interested in the objects of the society and desirous of contributing to its support." The annual dues for this new class of members will be $10 for individuals and $25 to $100 optionally for companies, firms or associations. An appeal will be sent out for a liberal enlistment of sustaining members throughout the metropolitan district, and no doubt is felt that it will meet a full response from individuals and organizations interested in the development and progress of the electrical industry.

The New York Electrical Society is the oldest electrical society in the country and has had an uninterrupted history of achievement. Its activities are of such a broad character that they do not conflict with, but rather supplement, the work of other electrical societies and associations. Philip Torchio is president and Thomas Commerford Martin secretary of the society.

## Georgia Electrical Association Meets at Tybee

At the second annual convention of the Georgia Electrical Association, held at Tybee on June 21, President L. W. Roberts, Jr., led a discussion on the subject of the letting of general building contracts and electrical installation contracts separately.

A plea for the use of non-technical terms in selling electrical goods to the retail trade was made by M. C. Turpin of the Westinghouse Electric & Manufacturing Company. Mr. Turpin said that two of the largest electrical goods firms have recognized the value of a well-trained sales force and are emphasizing this phase of their distribution system. He asserted that there are seven million electric flatirons in use in the United States and that nearly four million vacuum cleaners are now installed in the homes of the country. The majority of the three and a half million fans in use are in business offices, and Mr. Turpin pointed out the field for the sale of fans in the homes. He also discussed window-display and other methods of advertising.

W. D. Yates of the General Electric Company also addressed the gathering. New officers were elected as follows: President, J. E. Mellett, Atlanta; vice-president, Henry Morton, Columbus; secretary-treasurer, W. C. Drake, Atlanta. The members of the executive committee, of which Norton Frierson of Savannah is chairman, are C. F. Ludwig, Dublin; Joseph McNeil, Augusta; Sam Hatfield, Macon, and F. C. Landors, Valdosta.

# Brief News Notes

**Cedar Rapids to Have New Turbine.**—The Iowa Railway & Light Company has ordered a 10,000-kw. turbo-generator for its Cedar Rapids plant which is expected to be installed before the end of the year. In the boiler room a 680-hp. boiler with a chain-grate stoker will be installed. The total cost will be $500,000.

**Fort Dodge Spending $750,000 for Extensions.**—Construction work on the new generating plant of the Fort Dodge (Iowa) Gas & Electric Company, to cost $750,000, is rapidly progressing. The foundations are completed and boilers are being installed. Operation of the first unit will be started about Nov. 1. When completed the plant will have a capacity of 15,000 kw.

**Savannah Companies Are Merged.**—The Savannah (Ga.) Electric & Power Company has arranged to purchase the entire business and plant of the Savannah Lighting Corporation for the sum of $1,062,894. The electric company has applied to the Georgia Public Service Commission for authority to issue $1,000,000 of two-year 6½ per cent gold notes to be utilized in the purchase of the lighting corporation.

**Consumers' Power Said to Have Absorbed Citizens' Electric of Battle Creek.**—The Citizens' Electric Company of Battle Creek, Mich., which has for some time been in the hands of a receiver, has been disposed of by public sale for $765,000 to an agent thought to be acting for the Consumers' Power Company, in whose territory Battle Creek has long been included. The sale must be confirmed by the courts and approved by the Michigan Public Utilities Commission.

**War Radio Code Drawn Up.**—A complete code governing the use of wireless in time of war is the unique feature of the agreement on war rules by representatives of the governments of the United States, France, England, Italy and Japan, assembled at The Hague under authority of a resolution adopted at the Washington Arms Conference. It is the first time such a code has been drafted. By this code a neutral vessel or airship transmitting military intelligence for the immediate use of a belligerent will be subject to attack or capture.

**Montana Power Company Volunteers Rate Reduction.**—The Montana Power Company has requested the Public Service Commission of Montana to permit it to make a voluntary reduction in its rates. The action comes in answer to a citation to show cause why there should not be a substantial reduction. The new schedule proposed by the power company provides for a reduction ranging from 2 cents per kilowatt-hour for the first 100 kw.-hr. to 4 cents for all consumption in excess of 150 kw.-hr. for residential service. The rates are designed to save from $288,000 to $300,000 a year to 40,000 customers.

**Interconnection in Ohio.**—Toledo became a part of the great power transmission line tying together Pittsburgh, Youngstown, Warren, Alliance, Canton and the Toledo district recently when the connecting line between Toledo and Pemberville went into operation at 66,000 volts. At the latter city the power goes over the lines of the Ohio Power Company to Fostoria and from there over the lines of the Ohio Public Service Corporation to Cleveland, Mansfield and other Ohio cities. The link between Warren and Alliance has also gone into operation. It transmits energy at 132,000 volts.

**Reduction in Indianapolis Charges.**—A considerable reduction in the rates for electrical energy charged large industrial consumers in Indianapolis by the Indianapolis Light & Heat Company and the Merchants' Heat & Light Company has been ordered by the Indiana Public Service Commission, effective at once. The reduction will benefit several hundred firms and will in some cases be as much as 10 per cent. It is estimated that it will reduce the revenue of the first-named company from $80,000 to $100,000 a year and that of the Merchants' company from $40,000 to $50,000 a year. The new rate includes a demand charge of $1.25 a month per kilowatt and an energy charge of from 2.2 cents to 1.3 cents a kilowatt-hour. A reduction to domestic consumers was made about a year ago.

**Seeks Consolidation of Seven New York Companies.**—The New York Central Electric Corporation, which has been active in western New York during the last few months, has petitioned the Public Service Commission for permission to consolidate its western New York utilities companies in one organization and also for permission to finance the work. The companies that are to be consolidated are the Hornell Electric Company, the Perry Electric Light Company, the Warsaw Gas & Electric Company, the Dansville Gas & Electric Company, the Yates Electric Light & Power Company of Pen Yan and the Wayne Power Company of Sodus. These concerns have all been purchased by the corporation, which is a subsidiary of the E. L. Phillips interests of New York. The company asks permission to issue $4,100,000 in securities for the development of its property. It is reported that the company is contemplating a large hydro-electric development in southern New York.

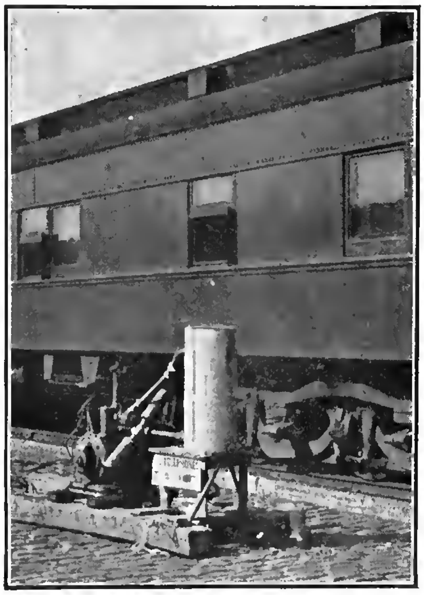
**Kansas Company Expands.**—The Empire District Electric Company of Kansas has ordered from the Westinghouse Electric & Manufacturing Company a 20,000-kw. turbo-generator unit for its station at Riverton. The turbine will be a high-pressure, condensing-type machine and will operate on 190 lb.

gage steam pressure, 120 deg. superheat and 29 in. vacuum. It will be provided with four openings for bleeding steam to heat the boiler-feed water. The unit will be designed so as to be converted readily for operation with 350 lb. steam pressure and 200 deg. superheat, since it is the company's intention to operate on this pressure later on. The turbine will be designed for a maximum rating of 25,000 kw. The generator will be designed for 25,000 kva. and will be wound for three-phase, 25 cycles and 6,900 volts, to operate at 1,500 r.p.m. It will be excited by a 250-volt flat compound-wound exciter. The total length of the unit will be 52 ft. and it will have a net weight of approximately 933,000 lb.

**"Overelectrification" Demoralizing New Yorkers, Says French Savant.**—New York City is in a bad way from "overelectrification," according to a French savant who just returned home from America in bad health, which he attributes to the action of the enormous number of electric currents of New York on his nervous system. Who this savant is is not revealed, but he has confided his case and what he believes to be its cause to a scientific writer, Dr. Charles Nordmann, who in an article declares his belief that his friend's complaints are well founded. Neither Dr. Nordmann nor the sufferer from New York will go so far as to say that the inhabitants of that city are either all sick or all crazy as the result of the partial electrocution from which they suffer every day, but there is an implication in Dr. Nordmann's article that many may be thus affected, however sublimely unaware of it they may be. He declares stoutly and with apparent seriousness his opinion that the overelectrification of cities is undoubtedly affecting the nerves, health and brain capacity of city dwellers.

**Promoting International Standardization.**—The second conference of secretaries of national standardizing bodies will be held in Baden, Switzerland, July 3 to 7. The American Engineering Standards Committee will be represented at the conference by its secretary, P. G. Agnew, who sailed June 20. Following the conference, Mr. Agnew will make a study of the industrial standardization work in the European countries in which it is most active. As a result of the first conference, which met in London in April, 1921, systematic co-operation between the different bodies was initiated and is now in effect. It is expected that the coming conference will lead to the extension of such co-operative work, which at present is largely limited to the systematic interchange of information on the status of industrial standardization activities in the various countries. There are now national standardizing bodies in eighteen countries, and it is expected that almost all of them will be represented. These are Australia, Austria, Belgium, Canada, Czechoslovakia, Denmark, Finland, France, Germany, Great Britain, Holland, Hungary, Italy, Japan, Norway, Sweden, Switzerland and the United States.

**Electricity Helps Turn Pullman Trains Into Hotels.**—Washington, D. C., was confronted with a great problem in the accommodation of the thousands of outsiders who visited the national capital during the recent Shriners' council. Nearly four hundred pullmans in the yards of the Pennsylvania Railroad were used as hotels, accommodating ten thousand persons, and in order to keep the storage batteries charged to furnish light and power for the electric fans 130 "Farmelectric" lighting plants, with a capacity of 1½ kw. each, were installed between the tracks on skids, each machine charging three cars at once. No two plants were nearer



each other than 200 ft., and in many cases they were several hundred yards apart. These lighting plants could not only furnish the energy cheaper than by any other method, but as the pullmans use 32-volt current, no alteration in the batteries was necessary.

**Oklahoma Properties Little Damaged by Flood.**—The Oklahoma Gas & Electric Company's properties suffered virtually no damage in the recent Oklahoma flood. The plants of the company, including construction work under way, were unharmed, despite the fact that the waters rose in Oklahoma City to the highest stage on record. Untiring work by the operating and construction forces of the company was responsible in large measure for the manner in which the properties in inundated sections withstood the ravages of the waters. One reason for the small damage was the strategic locations of the plants with respect to flood danger. During the entire flood period electric service was given to all properties. The new 20,000-hp. Harrah plant of the company under construction at Horseshoe Lake, 23 miles from Oklahoma City, and the 30,000-hp. River Bank power station under construction on the Arkansas River, 4½ miles from Muskogee, suffered no damage whatever.

# Associations and Societies

**Seattle Section, A. I. E. E.**—Charles Lund of the Municipal Lighting Depart- of Tacoma has been elected chairman and Joseph Hellenthal of the Puget Sound Power & Light Company secretary of the Seattle Section, A. I. E. E., for the ensuing term.

**Boston Section, A. I. E. E.**—The following officers were elected by this section at its recent annual meeting: Chairman, Alexander Macomber; vice-chairman, F. S. Dellenbaugh, Jr.; secretary and treasurer, Ira Cushing; executive committee, E. W. Davis, J. W. Kidder and W. R. McCann.

**Meetings of Association of Electragists.**—Coming section meetings of the Association of Electragists International (the contractor-dealer body) are announced as follows: Lakes Division (Michigan, Ohio, Indiana, Illinois and Wisconsin), Chicago, July 12; Central Division (Minnesota, Iowa, Missouri, Kansas, Nebraska, North and South Dakota), Omaha, July 13; Mountain Division (Idaho, Montana, Wyoming, Utah, Colorado and New Mexico), Denver, July 16; Pacific Division (Southern California and Arizona), Los Angeles, July 20; Pacific Division (Middle California), San Francisco, July 23; Pacific Division (Oregon and Washington), Portland, July 25; Western Canada Division (British Columbia, Alberta, Saskatchewan and Manitoba), Vancouver, B. C., July 27. The national officials of the organization who make this trip will visit also Salt Lake City on July 18, Calgary, Alberta, on July 30 and Moose Jaw, Saskatchewan, on July 31. The national convention will be held on **Oct. 8-13** at Washington, D. C.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Ohio Electric Light Association — Cedar Point, July **10-13**. D. L. Gaskill, Greenville.

National Electrical Credit Association—Boston, Aug. 9-10.

New England Division, N. E. L. A.—Swampscott, Mass., Sept. 6-8. Miss O. A. Bursiel, 149 Tremont St., Boston.

Michigan Electric Light Association—Grand Rapids, Sept. 11-13. Herbert Silvester, Detroit Edison Co., Ann Arbor.

Rocky Mountain Division, N. E. L. A.—Glenwood Springs, Col., Sept. 17-19. O. A. Weller, 900 15th St., Denver.

Illuminating Engineering Society—Lake George, N. Y., Sept. 24-28. S. G. Hibben, 29 West 39th St., New York.

Association of Iron and Steel Electrical Engineers — Buffalo, Sept. 24-28. J. F. Kelly, 513 Empire Bldg., Pittsburgh.

Indiana Electric Light Association—French Lick Springs, Sept. 26-29. T. Donahue, Northern Indiana Gas & Electric Co., Lafayette, Ind.

American Electrochemical Society—Dayton, Ohio, Sept. 27-29. Colin G. Fink, Columbia University, New York.

American Institute of Electrical Engineers—Pacific Coast convention, Del Monte, Cal., Oct. 2-5. F. L. Hutchinson, 33 West 39th St., New York.

## Commission Rulings

**Pole Preservation—Merchandise Expense—Investment of Depreciation Fund.**—In prescribing rates for the Kootenai Power Company, the Idaho Public Utilities Company made these among other decisions: The cost of treating poles in order to extend their life should be included in the capital account. Expenses connected with merchandise sales should not be included in operating expenses when revenues from merchandise sales are not included in the estimate of return. The company was required to invest at least 60 per cent of the depreciation fund not reinvested in the plant in income-bearing securities in the selection of which the chief consideration would be that of safety.

**Effect of Transmission-Line Loss on Rates.**—Holding that a higher rate must be charged for energy delivered to a distribution company over a long line with a comparatively large line loss than for energy delivered to a company having a shorter line with comparatively little line loss, the Maine Public Utilities Commission, in increasing the rates of the Farmington Falls Electric Company, declared that rates should be increased when it appears that power is purchased by the wholesale company at 3 cents a kilowatt-hour, transmitted over its lines for varying distances, and then sold under contract for the same or a less rate to the distributing company, since it is self-evident that such loss, if continued, would impair the ability of the company to render service.

**Chattel Mortgages on Crops as Security for Service to Irrigation District.**—A requirement by the Idaho Power Company that the Gem Irrigation District make advance payment for power used for pumping was not considered reasonable by the Idaho Public Service Commission, in spite of the fact that the district was in arrears for charges assessed during past years. It appeared that it was impossible to raise a cash payment, that chattel mortgages on crops had been accepted in the past and had been collected by officials of the district for the present year, and that any delay would seriously threaten the success of agriculture in the district. The power company was required to accept such chattel mortgages, although these mortgages had previously proved unsatisfactory, the commission holding that since these mortgages were all the security the district could muster, under the circumstances a refusal to accept them, although possibly justifiable financially, would not be reasonable. On the other hand, it was held that under these circumstances the power company was justified in supplying the district only in such amounts and at such times as power might be available from its present power plant and not required for the service of other customers, in view of the fact that its inability to build additional capacity wherewith to meet all demands imposed in its field was due in some part to the failure of the district to make payment.

**Maryland Commission on "Reproduction Cost New."** — Condemning the "lavish expenditures" of the Baltimore Gas, Electric Light & Power Company in presenting nearly 6,000 pages of testimony besides about 500 printed pages of briefs in support of its case in the recent rate proceedings before the Maryland Public Service Commission, "of which appalling array of words and figures the greater part relates to the reproduction-cost-new appraisal presented by the company," the commission said: "The company's experts adopted as a premise words cut from the pages of the highest judicial opinions, and by abstract logic deduced the familiar theory advanced by utilities that the Supreme Court of the United States authorizes the company to present and requires the commission to give an almost controlling consideration to the cost new of a theoretical plant constructed by the brain processes of the expert on the witness stand, through the employment of imaginary promoters, lawyers, financiers, general and sub-contractors and workmen, at a cost that includes every conceivable omission, contingency or expense short of the romantic and ridiculous, in a market admittedly unable to supply the needed material in the assumed period of two years, all in a city like unto the real Baltimore in population, improvements, commerce and industry, but conceived as hitherto without central gas and electric plants. We cannot agree that the courts have decreed that this administrative body, dealing as did the General Assembly before it with the rates of each utility as a problem all its own, must, in order to proceed according to due process of law, ignore the thousands of facts concerning this company and its properties which the commission knows and which its staff had learned as a part of the day's work in the twelve years of commission control during which the present plants have been largely constructed, facts of which the records and proceedings of the commission constitute a faithful chronicle and which the books of the company would, at the will of its officers, settle beyond all doubt. . . . Having clearly in mind the ends and aims of commission rate making and knowing that these can be attained only by treating each utility as a particular problem with all facts presented and otherwise ascertainable receiving due consideration, we must acknowledge that we have given but little weight to the 'reproduction cost new' appraisal of a theoretical plant as presented by the company when both commission and company have means of finding the present fair value of the real utility property. . . . We do not read the decisions as requiring us to do otherwise than we have done in this case."

## Recent Court Decisions

**Rates Established by Commission Cannot Be Altered by Company Unless Disallowed by Court.**—In Kilworth vs. Citizens' Light, Heat & Power Company of Lawrence, Kan., a dispute as to the effect of a federal court decree led the company to promulgate new rates including a service charge. The Kansas Supreme Court, holding that the federal court decree had not set aside the rate, and declaring that until the rate established by the rate-making authority has been set aside by a court of competent jurisdiction the utility has no right to promulgate a rate of its own or to make an added charge for the services rendered, disallowed the company's new rates and ordered the extra charge, which had been impounded, returned to customers. (212 Pac. 86.)*

**Water Site Owned by Utility May Be Expropriated.**—The Scituate Light & Power Company and others lost suits to prevent possible expropriation of their property for waterworks purposes by the city of Providence, R. I., through a decision recently rendered by the United States Supreme Court. The Rhode Island Legislature passed an act authorizing Providence to investigate a new source of water supply in the north branch of the Pawtucket River. It was stipulated that a fair price should be paid for any property necessary to this water supply and that the cost of removing to another site in New England any mill or factory on such property should be paid by the city. The complainants, whose property would be affected, alleged the act to be unconstitutional. The Supreme Court sustained its constitutionality, as had the State Supreme Court.

**Testimony to Good Condition of Electric Installation Alleged to Have Caused Fatality Raises Issue of Fact Merely.**—Reversing a directed verdict for the defendant and remanding the case for retrial, the Supreme Court of Iowa, in Welsh vs. Charles Frusch Light & Power Company, held that testimony to the good order of the wires alleged to have caused the death of a woman whose body was found near her washing machine merely raised a question of fact for the jury. Evidence of burns which went to show that she was killed by electric shock threw on the company the burden of explaining the assumed overloading of the wires extending into the basement with an excessive and dangerous current on some theory consistent with its exercise of due care in the maintenance, care and management of its system, notwithstanding any defect in the washing-machine motor. (193 N. W. 427.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## H. T. Sands Elected a Vice-President of N. E. L. A.

Howard Tuxbury Sands, who was elected fourth vice-president of the National Electric Light Association at its recent convention in New York, has been identified with the electrical industry since 1896, when he joined the Mechanics Falls Water, Electric Light & Power Company as superintendent of construction for a hydro-electric plant at Mechanics Falls, Me. He served there as superintendent, wireman, meterman, bookkeeper, collector, station mechanician and station operator. From 1901 to 1905 he was at Auburn, Me., as superintendent of the electric light company, relinquishing that post to become manager of the Haverhill (Mass.) Electric Company. Since that date Mr. Sands has been connected in various capacities with different properties of Charles H. Tenney & Company of Boston.

H. T. SANDS

Mr. Sands' election as a vice-president of the National Electric Light Association is the natural result of his distinguished services during the past year as chairman of the Public Relations Section of the association and of his untiring efforts in the successful establishment and maintenance of the New England Bureau of Public Service Information, which has contributed so much to the promotion of amicable relations between the public and the utilities in New England.

**E. L. Milliken**, assistant manager of the Blackstone Valley Gas & Electric Company, Woonsocket, R. I., has been made chairman of the management section of the Providence Engineering Society.

**C. S. Anderson**, formerly electrical engineer for the Duquesne Light Company, Pittsburgh, is now connected with the Electric Bond & Share Company, New York.

**C. Melvin Sharpe** has been made executive assistant to William F. Ham to assist particularly in the direction of the activities of the Washington (D. C.) Railway & Electric Company. Mr. Sharpe formerly was associated with the Chamber of Commerce of the United States but comes directly to his new position from the La Salle Extension University of Chicago.

**Arthur Kempston**, formerly Los Angeles district manager of the Majestic Electric Development Company, has become associated with Charles T. Phillips as a partner in the Charles T. Phillips Company, consulting engineers of San Francisco. Mr. Kempston was for a number of years city electrician of San Francisco and later was a field representative of the California Electrical Co-operative Campaign.

**F. M. Farmer**, chief engineer of the Electrical Testing Laboratories, New York, is at present in Europe for the purpose of comparing European cable practice with modern practice in the United States. He is studying especially the high-tension cables and the prospects for development in this field. Mr. Farmer will visit the various testing laboratories and his itinerary will include visits to England, France, Italy, Germany, Switzerland, Belgium and Holland.

**Gerhard M. Dahl**, who played a conspicuous part in the recent reorganization of the New Orleans Railway & Light Company as the New Orleans Public Service, Inc., was elected on June 14 to be chairman of the executive committee of the board of directors of the Brooklyn-Manhattan Transit Corporation. Mr. Dahl is a past vice-president of the Electric Bond & Share Company and is at present on the executive committee of the New Orleans Public Service, Inc., and a director of the Alabama Power Company, the Alabama Traction, Light & Power Company, the Lehigh Power Securities Corporation, the Duquesne Light Company and other utilities.

**Gen. James G. Harbord**, president of the Radio Corporation of America, accompanied by Mrs. Harbord, sailed for Europe on Wednesday, June 27, on the French liner *Paris*. General Harbord will attend the meeting of the Consortium of International Radio Corporations, which convenes on July 5 in London to discuss plans for a world-wide radio system. He will also be the representative of the War Department at the dedication of Belleau Wood by the Belleau Wood Memorial Association. **Owen D. Young**, chairman of the board of directors of the Radio Corporation and of the General Electric Company, and **Edward J. Nally**, managing director of international relations of the Radio Corporation, also sailed to attend the radio conference.

## Reginald M. Campbell Resigns

Reginald M. Campbell, who was appointed last year special representative of the American Copper Products Company with headquarters in New York City, recently resigned. For eight years previous to his association with the American Copper Products Company Mr. Campbell was identified with the Habirshaw Electric Cable Company, which he joined when he severed his connection with the Ohio Brass Company. He is well known in electric light and electric railway circles and also in the steam-railroad field. Mr. Campbell is a member of the New England Street Railway Club and the Railroad Club and Engineers' Club of New York. His present address is Engineers' Club in New York.

R. M. CAMPBELL

**J. B. Carter**, formerly district manager at Corcoran for the San Joaquin Light & Power Corporation, has been made agricultural sales engineer for the company with headquarters in Fresno. **Fred C. Carroll**, formerly assistant manager at Merced, will succeed Mr. Carter at Corcoran.

**R. G. Cushing**, formerly electrical engineer with the Winchester Repeating Arms Company, New Haven, Conn., has joined the electrical engineering division of Stone & Webster, Inc., with headquarters at Boston. Other recent additions to the electrical engineering division include **H. O. Murphy** of the engineering staff of the Bedford (Ind.) Stone Company and **Chester C. Dodge**, formerly of the marine engineering department of the General Electric Company at Schenectady.

**J. W. O'Brien**, line and service superintendent of the Utah Power & Light Company in the Ogden district, has been made division manager at Park City, Utah.

**Ralph A. Belmont** has received an extended leave of absence as sales manager of the Beaver Machine & Tool Company of Newark, N. J. While Mr. Belmont is away Lester H. Appel will be general sales manager.

**Dr. H. W. Nichols** of the research department of the Western Electric Company has been made the recipient of the Fahie premium by the Institution of Electrical Engineers of London, England, for his lecture on transoceanic wireless telephony.

**Morgan Brooks**, professor of electrical engineering at the University of Illinois, has just returned from Europe, where he spent the past nine months in travel combined with study of things electrical in Europe. Readers of the ELECTRICAL WORLD will recall Professor Brooks' "Intimate Notes from Italy," which appeared in the Nov. 18 issue. He expects to spend some time in the East before returning to Illinois.

**Calvin L. Jones**, welding engineer of the Westinghouse Electric & Manufacturing Company, Atlanta, has been elected vice-president of the American Welding Society. Mr. Jones has been elected for a two-year term and will be in charge of the activities of the society in its Southern division.

**Lee C. Mason**, treasurer of the Indiana & Michigan Electric Company, South Bend, Ind., has resigned from that position in order to take up the management of the new National Storage Warehouse Company. Mr. Mason's resignation takes effect July 1. He has been connected with the electric company for nineteen years.

**Charles G. Blakeslee** of Binghamton, N. Y., has been appointed counsel to the Public Service Commission of New York State, succeeding Ledyard P. Hale, whose resignation became effective today. Mr. Blakeslee was appointed a member of the commission in 1921. His term expired early this year, when he was succeeded by James A. Parsons of Hornell.

**Eli F. Bush**, formerly connected with the sales department of the Western Electric Company at Los Angeles, has resigned to practice law in that city. Mr. Bush has been with the Western Electric Company for the past two and a half years and before going to Los Angeles was in the Philadelphia office of the Westinghouse Electric & Manufacturing Company.

**E. Whitmore**, first vice-president and treasurer of the Manhattan Electrical Supply Company, Inc., New York, will retire from the company July 1. Mr. Whitmore became associated with the company shortly after it was formed thirty-three years ago. Rising from the ranks, he has served as general manager, secretary and vice-president and treasurer.

F. S. TERRY

## F. S. Terry and B. G. Tremaine General Electric's New Officers

Franklin S. Terry, chairman of the advisory board of the National Lamp Works, Nela Park, Cleveland, was elected vice-president of the General Electric Company and B. G. Tremaine, vice-chairman of the advisory board of the National Lamp Works, was elected a director at a meeting of the board of directors held in New York City on June 22. Mr. Terry was a pioneer in the incandescent-lamp business and has been an active promoter of progress in electric lighting. In 1880 he became associated with the Electrical Supply Company of Ansonia, Conn., his native town, and four years later he was sent to Chicago to establish a branch office there. In 1889 he organized the Sunbeam Incandescent Lamp Company of Chicago, of which he took personal charge on leaving the Electrical Supply Company in 1893.

It was at this time that Mr. Terry made the acquaintance of Mr. Tremaine, who, like himself, had conceived the idea of bringing together the numerous lamp companies that were fighting to maintain their existence. In 1901 their purposes were realized and the National Electric Lamp Company has its inception. Ten years later, when the company was merged with the General Electric Company, Mr. Terry and Mr. Tremaine were made managers of the National Lamp Works at Nela Park. Previous to his association with Mr. Terry Mr. Tremaine had not confined his efforts to any one particular line of work. He organized a fire-insurance business in Cleveland and later allied himself with a real-estate concern. In 1898 he became connected with the Cleveland Gas & Electric Fixture Company, and in 1899 he became a director and stockholder of an electric railway corporation in Fostoria, Ohio, where he helped organize the Fostoria Incandescent Lamp Company. In the latter part of the same year he met Mr. Terry, then manager of the Sunbeam Incandescent Lamp Company.

B. G. TREMAINE

**M. M. Myers**, formerly in the Eden washing machine department of the Union Electric Light & Power Company of St. Louis, has recently been made factory representative in St. Louis of the Sunbeam Electric Manufacturing Company of Evansville, Ind., maker of the Sunbeam "Surf-action" electric washer.

# Obituary

**Henry N. Spencer**, president of the Howell Electric Motors Company, Howell, Mich., died at his home in that city on Monday, June 4.

**W. R. Abbott**, manager of the Denver branch of the American Steel & Wire Company, died in that city June 18 after a short illness. Mr. Abbott took an active part in the affairs of the Colorado Public Service Association and various civic organizations in Denver.

**Charles A. Kilbourne**, president of the Kilbourne & Clark Manufacturing Company of Seattle, which he organized in 1900, died recently at Nyack, N. Y. Mr. Kilbourne was a pioneer of Seattle, having established the Seattle Electric Company, which was taken over by Stone & Webster interests.

**Chauncey C. Baldwin**, for more than twenty years connected with the Standard Underground Cable Company at Perth Amboy, N. J., died at his residence there June 7 after a brief illness. Mr. Baldwin had been one of the outstanding figures in the copper-rolling and wire-drawing industry for many years. His connection with the Standard Underground Cable Company dates from 1902, when he became superintendent and manager of its metal departments at Perth Amboy, including its copper-melting furnaces and equipment for the production of copper and brass rods and wire, weatherproof tubes and magnet wire products. In 1916 he was elected a vice-president of that company, which position he held at the time of his death. He took an active part in local affairs and for some years past had been president of the Perth Amboy Industrial Association.

## Work for Trade Associations*

### Importance of Production and Distribution Statistics—Need of Collective Action by Organizations to Secure Beneficial Standardization—Educating the Buyers

By F. M. Feiker

Special Representative United States Department of Commerce

During the first year of Herbert Hoover's administration as Secretary of the Department of Commerce definite steps were taken by that department to correlate its activities and services with the trade associations of the country. With this idea in mind committees were established in statistics in standardization, in foreign trade and other subjects. Soon after the department undertook to co-ordinate the work of the associations with the services of this branch of the government came the so-called "Hardwood decision," of the Supreme Court, which was open to a variety of interpretations by trade association executives, and as a result the department was deluged with inquiries as to what trade associations might do and might not do. These inquiries concerned particularly the gathering of statistics. The department, in order to answer intelligently the questions being put to it from a great variety of trade associations, undertook an inquiry into the activities of such bodies, with the result that forty or fifty separate activities were found, a large proportion of which could in no sense be construed as not in the public interest.

This inquiry resulted for the time being in the so-called Daugherty correspondence, in which the department asked the Attorney-General a group of hypothetical questions, which he in turn answered, with the idea of eliciting what were and were not fair and unfair practices in trade association activities.

My inquiries into these matters at Mr. Hoover's direction led me into a very much deeper study of the whole question of trade associations, with the result that, with the co-operation particularly of E. W. McCullough, chief of the Fabricated Production Division of the Chamber of Commerce of the United States, and Nathan Williams, counsel for the National Manufacturers' Association, I gathered together a very detailed classification of the constructive activities of trade associations, which later was rearranged and classified into a broad classification of about fourteen headings, including statistics, legislative activities, simplification, standardization, cost accounting, credit, collection activities, trade disputes in ethics, employee relations, insurance, public relations, traffic and transportation, commercial research and industrial research.

#### Practice Varies Widely

Three or four general truths stand out of this investigation of several hundred trade associations. It is evident that the practice of individual associations varies widely. Some of them have only one or two of the fourteen or fifteen classes of activities suggested. Others have perfected five or six of the activities, and others have found that emphasis on one or two is the true purpose of the association and constitutes the vital interest of its members. Very few trade associations have their objectives stated broadly or definitely enough. This misunderstanding of objectives has tended to create misunderstandings not only between members in a single group, but between associations and societies of various kinds, with the result that there is a considerable overlapping, and time and money would be saved by the opportunity that exists to coordinate and help give a sense of direction to the different movements within a trade.

A book or two might be written on this subject. The chief point to emphasize is that the trade association offers a natural clearing house for the collection of statistical data, in which most industries are lamentably weak. Many industrial policies, not only of individual businesses but of a group of businesses as a whole, are based either on partial knowledge or on a complete lack of definite statistical information. The development of statistics ranges through the whole field of manufacturing and of marketing, starting with production statistics, taking up employment statistics of various classes, shipments, sales, stocks on hand, orders and cancellations and the whole field of price quotations.

Production statistics of one kind or another have been collected for more than sixty years, and there is more information in the statistics of production than in any other single field of statistical inquiry, and yet here there are great gaps in essential production statistics even with regard to such basic commodities as agricultural products. Some associations, such as the Rubber Association of America, make monthly reports to the Bureau of Census and these monthly reports form the basis for the public distribution of the information. The *Survey of Current Business*, which is published by the Department of Commerce under the auspices of the Bureau of Census, brings together several classes and groups of production statistics. The greatest paucity of information lies in the field of statistics of distribution.

An interesting side-light on the collection of industrial statistics is the fact that the average group of manufacturers is more interested in the statistics of the people from whom they buy and to whom they sell than in the collection of their own data. They forget they are the sources of supply or the market in their turn for other classes of industry. They forget that there is no such thing as one industry being apart from all others, that there is an interdependence between all industries. The plate-glass manufacturers, for example, are very much interested in the trend of the production of automobiles because plate glass enters into the manufacture of

*An address before the meeting of the Electric Power Club at Hot Springs, Va., June 11-14, 1923.

automobiles so extensively today, and in their turn every automobile manufacturer is as much interested in the agricultural statistics which represent the farmer's buying power as he is in the relative output of his own product as compared with the total number of cars produced by all manufacturers. We can never get a basic statistical control in business until we have much more highly developed sources of statistical information and, what is probably much more important, a development of the practical use of such statistics to go hand in hand with the development of the statistics themselves.

### LEGISLATIVE ACTIVITIES

Next to the statistical activities, by far the larger number of trade associations and organizations of manufacturers are interested in legislative activities in various forms. Inquiry into the activities of associations in this respect touches on practically all classes of legislation, including tariffs and subsidies, transportation and traffic legislation, trade restriction and trade practice, laws affecting standardization and the establishment of standard specifications such as pure food and drug laws, labeling and branding, and so on. There are, of course, measures directly pertaining to labor, conditions of employment, employment insurance laws, labor welfare and labor union relations and so on.

Several associations have special committees working directly with the various government departments. The main purpose of the association in this direction is to act as a fact center, and, public opinion to the contrary, if a trade association procures the facts and sets them forth in a non-partisan manner, with the interests of the public as well as the trade in mind, the legislative committees of our state and federal governments will be found eager for these facts. By way of illustration, the legislative committee of the National Automobile Chamber of Commerce, working in harmony with similar committees of the automobile associations, the Rubber Association, the Motor Accessories Association and other bodies, has proposed uniform vehicle laws, so that interstate travel of motor vehicles will not be handicapped by the lack of uniformity between states. Scores of illustrations of this constructive legislative development can be given.

It is estimated that the automotive industry alone saved $750,000,000 in 1920 by the adoption of the dimension standards of the Society of Automotive Engineers. One implement and vehicle manufacturer told me that he had cut his inventory $200,000 because of carrying through the work that he had undertaken as a result of his War Industries Board activities.

Broadly, there are two classes of programs involved in association activities in standardization and simplification. Standardization in general involves technical or scientific laboratory research, while simplification is more a matter of commercial procedure and involves rather the question of dimensions and the elimination of excess variety and style.

My observation of the work of associations is that the greatest need lies in putting technical standards into actual commercial practice. After all, it is the buyer who determines whether standards will stick, and in a broad way, the education of the buyer has not been sufficiently included in the consideration of the broad problems in simplification and standardization which touch an individual industry.

### COST ACCOUNTING

In the paper industry and in the manufacture of chairs, also in the Paint Manufacturers' Association and several of the textile organizations, very advanced work has been done in devising uniform cost systems. In the promotion of uniform-cost determination associations should be warned against arbitrary uniform costs as to any items of expense. In the so-called Hoover and Daugherty correspondence the Attorney-General has said that it is as clearly a violation of the law to agree upon the cost of an item that constitutes a substantial part of the total cost price as it is to agree upon sales price. But much work can be done in the direction of the assurance of uniform cost accounting by the plan carried out, for instance, by the Harvard Graduate School of Business Administration. The need is to be sure that every individual in an association or trade group figures his costs on the same number and kind of items. Individual costs per item may differ, but the total cost should include the same number and kind of items.

Individual members of an industry often gain by agreeing to give to a trustee, which may be a trade association, a power of attorney to grant licenses to other members under all patents which they own, with the understanding that the trustee will license every member of the association to employ all of the patented inventions either with or without a reasonable money consideration. The National Automobile Chamber of Commerce solved many vexing legal problems by adopting this method, so that today most of the leading automobile manufacturers receive without payment of money royalty the full benefit of all improvements in motor-car construction.

### COMMERCIAL AND INDUSTRIAL RESEARCH

The functions of commercial research involve, broadly speaking, general and trade information service, commercial development and promotion publicity and protective measures, whereas industrial research involves questions of technical development and co-operation between manufacturers investigating common technical problems. It was recently estimated that $35,000,000 is spent each year by American enterprise in research in industry and commerce. Seventy trade associations, besides other manufacturers, are concentrated upon research, and trade association investment in research involves sums up to $100,000 annually. It is becoming more and more apparent that there are problems of common interest which are so fundamental and of such broad application that the resulting data interest many manufacturers' establishments, and that this type of research may be conducted without interfering with competitive interests or the relative commercial positions of the co-operating firms.

Two main subjects stand out from my study of the trade association movement in the United States. The first is the fact that the only way to solve some of the problems facing industry is through collective action by organizations. While the association idea has been fairly well established as a method of accomplishment, there are still many who forget that co-operation means that all individuals banded together carry a much greater load than that which each individual carries.

The second great principle that stands out of this survey is that there are two sides to any problem,

whether it be a problem of sale of a product, sale of a service or sale of an idea. One is the seller's side and one is the buyer's side. Associations representing sellers in general sometimes forget the buyer and emphasize primarily the selfish motives of the seller. They also sometimes forget that what the seller sets up as ideal may be turned down by the buyer, so that the ideals established will be nothing more than paper standards.

### Associations' Real Opportunities

This last observation applies particularly to the work of standardization in industry, and it seems to me that one of the real opportunities that face the members of the Power Club and other electrical associations is the opportunity for educating the buyer in industry. It is quite possible to set up standards which are useful in the development of manufacturing and the reduction of production costs. These the members of an association themselves control. It is quite possible to set up standards which are intrinsically much better from an engineering viewpoint. But there remains the commercial consideration of what is the buyer's relation to such standards. Until the buyer is convinced as to the value of particular standards established they cannot be enforced on any basis of economics. The good old law of supply and demand is the only one that we in America wish to see applied in the development of a less wasteful program for industry. We do not wish to see the government step in and say, "You must do so and so." We resent it when any single group, whether of manufacturers or labor leaders or a professional class, steps forward and says, "This is the way you must do something." Rather in America we believe in taking the buyer's point of view into consideration so that the conclusions we arrive at shall be acceptable to both him and ourselves.

This requires education of the buyer. We are fortunate in America to have a technical press which has this vision of its service to industry. This is one of the great forces of industrial education. But there are greater opportunities for the collective education of the buyer through association activity that are being used in some associations and are not being taken advantage of in others. In selling agricultural commodities, where the Sherman law does not hold, collective advertising of trade-marked brands is possible as a part solution for the problem I have outlined. Such a program is not economically possible where the manufacturers are prevented from banding together by the Sherman law and where such action might be in restraint of trade. But the opportunity for collective advertising, for example, of a program of standardization is a sound one, if it is not confused with the opportunity of the individual to advertise. In this direction several associations have done important work.

Another great opportunity facing the electrical industry particularly is the study of markets. We have grown as an industry as engineers. We ought not to take too much satisfaction in the growth of our industry because a large percentage of that growth is due to the normal demand and not to any high enterprise on our part.

All of us are now approaching a time when enterprise is needed, if we are to keep the curve of sales upward, and we have through the association an opportunity for collective action in marketing programs which is very specific and very definite. I look to see this organization take steps in this direction, because we all believe that there is still great opportunity for the application of electricity in the "pursuit of life, liberty and happiness" in the United States.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

FUNDAMENTAL conditions in Eastern district business were mainly sound at the beginning of this week, and representative jobbers were handling a large volume of trade in heavier wiring material, fans and lamps. Stocks were reported complete in nearly all lines, although buying has been strictly confined to requirements evident in the near future and to current demands.

Prices were fairly steady last week. Interest in electric ranges is growing rapidly in this district. Washers and cleaners were in good supply Monday, with intense competition for business. Retail trade of a seasonal sort has responded to the warm-weather stimulus. A lull in the textile industry continues, and building contracts fell off sharply last week compared with last year.

Money is fairly easy. The demand for linemen exceeds the supply, and central-station extension work is being hard pressed in some cases on this account. A split between unions in the telephone field throughout New England made it appear probable Monday that the strike called for Tuesday would lose many adherents.

Sales activities on behalf of jobbers and manufacturers are marked throughout this territory, and a large amount of business is being handled by distributors and many records are being chalked up by electrical concerns in the way of maximum volume of sales, units of product or output in many cases considerably exceeding the 1920 figures.

### Wiring Device Manufacturers Report Spotty Sales

MANUFACTURERS of wiring devices report a reduced demand of late for sockets and switches, although the production of the latter for electric range use is increasing rapidly in volume, this being the brightest spot at the moment in this branch of trade. In some plants employees have been laid off temporarily, while in others sufficient work is on hand in the way of building up stocks and filling back orders to keep production active for some time.

Jobbers are buying with great care and there is little disposition in territories where distributors are located near the manufacturing plants to accumulate stocks much above current

### Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | \$0.034 | \$0.034 | \$0.0252 |
| Cold finished shafting, per lb. | 0.042 | 0.042 | 0.0325 |
| Brass rods, per lb. | 0.1850 | 0.1913 | 0.155 |
| Solder (half and half), per lb. | 0.2862 | 0.2812 | 0.22 |
| Cotton waste, per lb. | 0.1231 | 0.1231 | 0.104 |
| Washers, cast iron (½-in.), per 100 lb. | 4.66 | 4.66 | 4.00 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 3.08 | 2.96 | 3.11 |
| Machine oil, per gal. | 0.349 | 0.349 | 0.34 |
| Belting, leather, medium, off list | 42½% | 42½% | 46¾% |
| Machine bolts, up to 1-in. x 30-in., off list | 44¼% | 44¼% | 59¾% |

requirements. Wiring-device makers have enjoyed a very fine spring business, as a rule, and in well-informed circles one hears little pessimism as to the prospects for next winter's business.

Wages have been maintained at a high level, and deliveries of brass and porcelain have given considerable trouble until quite recently. In fact, the porcelain situation is reported as still abnormal, uneven filling of orders tending to delay the delivery of complete shipments in many cases. There seems little doubt that the inordinate demands of labor in the building trades have put a brake on the progress of wiring-device production for the time being, at least in some localities.

Prices are somewhat unsteady, reflecting readjustment tendencies. South American business is fairly good, according to wiring-device exporters.

## Estimates $125,000,000 Will Be Spent for Transmission Lines

BETWEEN 125,000,000 lb. and 200,000,000 lb. of copper will be consumed for transmission lines to be erected this year at a cost of approximately $125,000,000, according to estimates made last week by the Copper and Brass Research Association. A statement issued by the association last week says in part: "The estimated expenditure of $900,000,000 for transmission-line construction in the United States during the next five years will afford a market for copper wire and cable of between 900,000,000 lb. and 1,500,000,000 lb."

## Chicago Jobbers and Dealers Have Quiet Business

CHICAGO jobbers and dealers have experienced a quiet week, although wiring device sales have stiffened up somewhat and demand for rubber-covered wire has progressed. Some lower prices were being quoted on future deliveries of lead-covered wire, but no reductions in prices were announced. Pole-line hardware and high-tension equipment sales have been good, as central-station buying keeps up.

The unusually warm weather which descended upon this territory this week caused a demand for fans. Sales were very numerous and jobbers placed large orders. The number of fans sold this week is considerably above the number sold last year at this date.

## Denver Suffers Slight Slump in Building Operations

A SLIGHT slump in building operations during the past fortnight has been noted. This is generally believed due to propaganda about high building costs and the advisability of waiting six months, a year, or even longer, to consider additional construction. Large buildings and industrial projects have not been affected, while in the case of dwellings, in so far as electrical work is concerned, the prices charged to the public are not so high as those in force two years ago.

The banks indicate a secure financial situation. In the agricultural areas farmers are being accommodated to a major degree, and with the prospects of good crops, the outlook is more optimistic than in 1922. The storms sweeping Wall Street have hardly created a ripple in local financial circles. In fact, bankers seem to be more interested in the call-money rate than in stock-market fluctuations.

Government reports state that every able-bodied man in the Rocky Mountain region who wants to work can get a job. Industrial plants linked with building materials are running to capacity. New railroad construction in Montana, Wyoming and New Mexico is making more jobs for workers, and business as a whole in those sections is better.

## Gain of $1,201,368 Shown in April Electrical Exports

TOTAL exports of electrical machinery, apparatus and appurtenances for April were $5,981,191, a gain of $1,201,368 over April, 1922, when the total amounted to $4,779,823. In March, 1923, total electrical exports amounted to $6,344,842. The accompanying figures are supplied by the Bureau of Foreign and Domestic Commerce.

## The Metal Market

THE metal market has been inactive without exception all week. Consumers all report that their plants are as busy as the supply of labor will permit, but there continues to be less business booked ahead, and with the general tendency to a decline in the commodity price level, they are not buying metal so far forward as normally.

The export copper market has tapered off somewhat, but the volume is still fairly good, at prices netting producers about ¼c. above domestic business.

NEW YORK METAL MARKET PRICES

| | June 21, 1923 Cents per Pound | June 28, 1923 Cents per Pound |
|---|---|---|
| Copper, Electrolytic | 15.25 | 14.87½ to 16.00 |
| Lead, Am.S.& R.price | 7.25 | 7.25 |
| Antimony | 7.50 | 7.50 |
| Nickel, ingot | 27.00 to 32.00 | 27.00 to 32.00 |
| Zinc, spot | 6.37 | 6.00 |
| Tin, Straits | 41.90 | 41.00 |
| Aluminum, 98 to 99 per cent | 26.00 | 26.00 |

ELECTRICAL EXPORTS FOR APRIL, 1923, COMPARED WITH CORRESPONDING PERIOD A YEAR AGO

| Articles | Value April 1922 | 1923 |
|---|---|---|
| Turbines | $122,947 | $35,290 |
| Generators: | | |
| Direct-current: | | |
| Under 500 kw | 34,268 | 87,953 |
| 500 kw. and over | 107,803 | 58,211 |
| Alternating-current: | | |
| Under 2,000 kva | 31,354 | 9,846 |
| 2,000 kva. and over | 114,000 | 259,453 |

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Wagner Electric Pays Preferred Stock Dividends

The directors of the Wagner Electric Corporation, St. Louis, directors at a recent meeting voted to pay the regular quarterly dividend of $1.75 per share on the 15,000 shares of 7 per cent preferred stock of the company. These dividends are to be payable July 1, 1923. The officers of the company report sales for the month of May as the largest of any month of the current year.

A general price advance of 10 per cent on practically all of the well-known lines of the company became effective May 15. The cash position of the corporation continues to be very comfortable—current liabilities being confined entirely to merchandise obligations not yet due and without bank borrowings of any character.

## Canadians Remain in Control of Canadian General Electric

Control of the Canadian General Electric Company, which has large factories in Toronto and in Peterboro, will remain in Canada, A. E. Dyment, president of the company, declared last week, commenting on a revival of rumors that the Canadian organization would be absorbed by the General Electric Company, of Schenectady, N. Y., on Sept. 1.

He declined to discuss the reported merger and asserted there had been no change in the status of his organization as a Canadian corporation.

It was reported some time ago that the American company had acquired a large block of stock in the Canadian company and was seeking a controlling interest.

## Offers Prize for Best Electric Locomotive for Coal Mines

Lieut.-Col. G. R. Lane Fox, British Secretary for Mines, announces that, in order to encourage the production of a safe and efficient type of electrical storage-battery locomotive for use underground in coal mines, and with a view to displacing pit ponies in deep and hot mines, Charles Markham, colliery director of Ringwood Hall, Chesterfield, has placed at his disposal the sum of £1,000, to be offered as a prize for the best vehicle. Judges representative of the coal-mining industry of Great Britain, the Institutions of Mining and Electrical Engineers and the Mines Department have been appointed to lay down the conditions under which the competition is to be conducted and to adjudicate upon the merits of competing designs.

The competition will be open to manufacturers of any nationality and will remain open for a period adequate to allow competitors in foreign countries and the British Dominions to submit their designs. Working trials in England of those vehicles selected for test will subsequently be arranged.

The preliminary details in connection with the competition are approaching completion and a formal announcement will shortly be made of the conditions.

## Promoting "Universal" in Denver

H. W. Woeber, representative of the electrical department of Landers, Frary & Clark in the Denver territory, is assisting the Moore-Bird Company, recently organized as a hardware distributing agency at 1720 Wazee Street, in the development of an electric appliance department featuring "Universal" equipment. Mrs. Lena West, factory demonstrator, has been assigned to Denver for special development work in conjunction with the display to be made by Landers, Frary & Clark at the Colorado "pageant of progress" in July.

## Orton & Steinbrenner Election

The Orton & Steinbrenner Company, 608 South Dearborn Street, Chicago, manufacturer of material-handling equipment, announces the election of the following officers: P. A. Orton, president and general manager; E. B. Ayers, vice-president; Herbert Mertz, secretary and sales manager; Harry Shaffer, treasurer and purchasing agent; G. L. Niederst, chief engineer, and Alex Orton, works manager.

No change in the management, control or policy has been made, nor is any contemplated. The reorganization is occasioned only by the resignation of H. G. Steinbrenner as president and the disposal of his interest in the company.

## Louis Allis Appointments

The Louis Allis Company, manufacturer of direct-current and alternating-current motors, Milwaukee, announces the following changes and additions to its sales representation:

The H. M. Thomas Company, Oakland Bank Building, Oakland, Cal., has recently been appointed as exclusive sales representatives for the entire State of California; E. H. Albrecht & Company, 309 Lewis Building, Portland, Ore., have been appointed as exclusive sales representatives for Oregon; J. W. Jones, 704 Pontiac Building, St. Louis, has been appointed as exclusive sales representative for the St. Louis territory.

## Plans Habirshaw Wire Merger

Plans for the reorganization of the four Habirshaw wire and cable companies have been worked out and copies were sent last week to the holders of securities of the four companies concerned. The four concerns will be consolidated into one company, known as the Habirshaw Electric Cable Company. The companies to be thus merged are the present Habirshaw Electric Cable Company, the Electric Cable Company, the Habirshaw Electric Cable Company, Inc., and the Bare Wire Company.

The new company will take over the properties of the four existing concerns and in turn issue new stock, both preferred and common. Equal voting privileges will be accorded both the preferred and the common stockholders. The preferred stock issue will consist of $1,500,000 of $100 par stock and the common stock will be comprised of 300,000 shares. The preferred stock is to be used for sale to depositing creditors and the underwriting syndicate. Half of the common stock issue will be distributed to depositing creditors and the other half will be sold to depositing creditors and the underwriting syndicate.

It was announced that Dillon, Read & Company would underwrite 15,000 shares of preferred and 150,000 shares of common stock of the new company. Part of the proceeds will be used for the settlement of claims of the United States government and for payment of taxes, obligations and liabilities of receivers and for additional working capital.

The plan of reorganization was worked out by Malcolm D. Whitman, chairman of the committee; J. B. Beaty, Wylie Brown, F. J. Leary, E. A. Potter, Jr., E. N. Potter and T. E. Quisenberry.

## Campaign Against Unscrupulous Battery Makers and Sellers

With the announcement that it purposes to curb and, if need be, to aid in the prosecution of deceptive advertising in the battery and automotive electrical fields, the national vigilance committee of the Associated Advertising Clubs of the World and its affiliated better-business bureaus and commissions have launched a campaign against unscrupulous manufacturers and dealers.

That some service stations known and advertised as the authorized representatives of well-known manufactures are prone to trade upon the established good name of reputable concerns through the substitution of foreign or inferior parts in the reconstruction of batteries is the contention of the vigilance committee.

"The automobile owner is at the mercy of a battery station in the matter of having his battery charged, changed, rebuilt or repaired," says a special report issued by the committee, "for the reason that it is impracticable to dissemble a battery and identify the parts.

"If the owner wants the repair parts put out by the maker of his battery," the report continues, "he is entitled to receive them, even though there may be repair parts made by others which could be used just as efficiently. Substitution under such circumstances constitutes a fraud upon the public and jeopardizes the good will and reputation of the battery manufacturer which the service station purports to represent."

The vigilance committee states that complaints have come to it from many sources to the effect that the motoring public is being imposed upon from time to time by unscrupulous concerns which offer a remedy for all battery troubles through the medium of pastes, fillers, solutions and other compounds to take the place of regular electrolytes. Tests and analyses of several of these "dope" solutions indicate that, while they apparently give a battery greater momentary "kick," they oftimes contain ingredients which are absolutely ruinous to the plates and separators, thereby shortening the life of the battery from 50 to 75 per cent.

Purchasers are warned to inquire carefully regarding such solutions, and assure themselves that the substitute they are procuring has real merit and will not damage the battery, before placing their orders.

Another misleading and sometimes fraudulent feature attends the manner in which many so-called "dry batteries" are advertised, the committee says. Some of these are exploited as "new and wonderful" inventions that "never need to be taken to a service station," that "require no water" nor added charge "no matter how long in use," "cannot freeze," etc.

## Beaver Machine & Tool Moves General Office to Newark

The Beaver Machine & Tool Company, Newark, N. J., announces the removal of its general office from 50 Church Street, New York City, to 625 North Third Street, Newark, where the company has just completed a new wing for office use, affording additional space for sales and executive offices.

The Hotpoint Electric Appliance Company, Ltd., of 21 Berners Street, Oxford Street, London, has been appointed sole selling agent for the British Isles by the Beaver Machine & Tool Company, Inc., manufacturer of the "Beaver" line of wiring devices.

## Denver Supply Firm Organized

W. J. Keating, formerly one of the executives of the Electrical Supply & Construction Company, Denver, has organized a new company, which was recently incorporated under the name of the United Electric Company. Associated with him in the new undertaking are A. P. Ware and S. S. Keating. It is understood that a line of lighting fixtures and parts will be distributed and that a manufacturing plant and plating works will be operated.

**The Bristol Company**, Waterbury, Conn., manufacturer of measuring instruments, has taken bids for a large two-story addition to its plant in the Platts Mills section.

**The Watertown Manufacturing Company**, Watertown, Conn., manufacturer of insulating products, has awarded a contract for a one-story addition, 70 ft. x 120 ft., which is estimated to cost $50,000.

**The Continental Storage Battery Manufacturing Company, Inc.**, 111 West Washington Street, Chicago, recently organized with $15,000 capital stock, has leased 4,000 ft. of floor space at 221 East Twenty-first Street, Chicago, to manufacture storage batteries and storage-battery plates. J. W. McCormack is the president of the company.

**The Rome Wire Company**, Railroad Street, Rome, N. Y., will commence the immediate erection of a new addition to its branch plant on Clyde Street, Buffalo, to cost about $70,000. Plans have been filed.

**The Acheson Graphite Company**, Niagara Falls, N. Y., has perfected plans for the reopening of its Buffalo plant, constructed during the war period and inactive for some time past. It will be operated in conjunction with the Niagara Falls works and given over exclusively to the production of heavy electrodes for electric steel furnaces.

**The Seneca Copper Corporation**, 120 Broadway, New York City, is arranging for a bond issue of $1,500,000, of which $1,000,000 will be sold at once, a portion of the proceeds to be used for extensions and improvements.

**The Electric Signal Manufacturing Company**, Miami, Fla., recently formed with a capital of $500,000, will operate a local plant for the manufacture of electric signal apparatus. H. W. LaVan is president.

**The Walker Vehicle Company**, Chicago, manufacturer of electric trucks, announces the opening on June 1 of its new service station at Thirteenth Street and Ely Avenue, Long Island City, New York. E. T. Teepe is service manager.

**The Eureka Vacuum Cleaner Company**, Detroit, on June 14 held a dinner at the Hotel Pennsylvania, New York City, in honor of Fred Wardell, president, and A. L. McCarthy, its vice-president and general sales manager. More than three hundred salespeople connected with its Eastern sales agencies were present.

**The Bijou Motor Appliance Company**, Fifteenth and Garden Streets, Hoboken, N. J., manufacturer of electric lighting and starting equipment, has been acquired by the General Electric Company for a consideration said to be $250,000 and will be continued in operation for the same line of production, with certain additions. The purchasing company is also understood to have secured the rights of manufacture of the Bijou equipment.

**The Crescent Insulated Wire & Cable Company**, North Olden, Trenton, N. J., has awarded a contract for a one-story addition to its plant.

**The Chambers Manufacturing Company**, Butler, Pa., manufacturer of farm-lighting plants and other electrical equipment, has acquired a plant at East Butler, Pa., and will remove to that location. Additional equipment will be installed.

**The Spaulding Electric Company**, 1344 Michigan Avenue, Detroit, James G. Spaulding president, is taking bids on a general contract for a new one-story plant on Michigan Avenue for repair and parts manufacture, estimated to cost $25,000.

**The Pyle National Company**, 1338 North Kostner Avenue, Chicago, manufacturer of locomotive lighting equipment, searchlights, floodlights, etc., has awarded a contract for a two-story buffing shop, 45 ft. x 69 ft., at 1358 North Kostner Avenue, to cost $25,000.

**The Triumph Electric Company**, Cincinnati, announces the removal of its offices in New York City to 25 Church Street. George F. Adams is in charge.

**The Birtman Electric Company**, Chicago, manufacturer of house-cleaning devices, has opened offices at 2003 Magnolia Building, Dallas, Tex., with Fred E. Roegge as Southern division manager. Dallas has been chosen as one of the ten divisional distribution centers in the United States.

**The Niagara Blower Company**, Buffalo, has opened a new plant at Ontario Street and the New York Central Railroad tracks.

**The North American Manufacturing Company**, Cleveland, has opened a branch office at 53 West Jackson Boulevard, Chicago, to handle low-pressure gas and oil burning equipment.

**The American Insulator Company**, Danbury, Conn., manufacturer of electrical insulators, etc., has completed plans for the erection of a new one-story addition, to be equipped as a drying and heater department. Another extension will be constructed to the polishing department.

**The Locke Insulator Company**, Charles and Cromwell Streets, Baltimore, manufacturer of insulators for high-tension service, has filed plans for the construction of two additions, 60 ft. x 80 ft. and 32 ft. x 40 ft. Parker, Thomas & Rice, Union Trust Building, Baltimore, are architects.

**The Edwin F. Guth Company**, St. Louis, lately incorporated, will take over and merge the St. Louis Brass Manufacturing Company, Washington Street, and the Brascolite Company, Jefferson and Washington Streets, the last noted having been operated as a subsidiary of the St. Louis Brass Company. The new company will continue in the same line of electric lighting equipment manufacture, and plans are being considered for general expansion in the different departments. Edwin F. Guth is president.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in Rotterdam, Netherlands (No. 6,959), of ammeters for motorcycles.

An agency is desired in Wellington, New Zealand (No. 6,877), for electrical supplies and specialties.

Purchase is desired in Apia, Samoa (No. 6,881), for equipment for hydro-electric plants and appliances for home lighting, etc.

Purchase is desired in Malmo, Sweden (No. 6,955), of lamps, wire, heating appliances and specialties; also purchase (No. 6,955) of wiring devices.

An agency is desired in Liège, Belgium (No. 6,938), for electric motors.

Purchase and agency is desired in Ahmedabad, India (No. 6,968), for electric motors, electrical fixtures, fittings, sundries, and lamps particularly.

Purchase is desired in Rivière du Loup, Canada (No. 6,888), for radio equipment.

Purchase or agency is desired in London, England (No. 6,908), of radio parts of all kinds.

An agency is desired in Rio de Janerio, Brazil (No. 6,926), for specialties, such as storage batteries and lighting fixtures.

An agency is desired in Vienna, Austria (No. 6,935), for air compressors with electric motors. Purchase and agency is also desired (No. 6,886) of automobile equipment, including lamps, etc.

CABLE TERMINALS FOR BRISBANE, AUSTRALIA.—Tenders will be received by the Postmaster-General's Department, Brisbane, Australia, until July 31 for cable terminals.

TELEPHONE SWITCHBOARDS FOR MELBOURNE, AUSTRALIA.—Tenders will be received by the Postmaster-General's Department, Melbourne, Australia, until Aug. 7 for telephone switchboards.

ELECTRICALLY DRIVEN PUMPS FOR SYDNEY, AUSTRALIA.—Tenders will be received by the Department of Public Works, Sydney, New South Wales, Australia, until July 23 for pumping machinery for the Glen Mines (New South Wales) water supply, including electrically operated pumps, switchgear, transformers, cables and wiring, etc.

PROPOSED HYDRO-ELECTRIC DEVELOPMENT IN NEW SOUTH WALES, AUSTRALIA.—The New South Wales Railway Commissioners are reported to have selected a site at Middle River, Maarangaroo, on which they will erect a power plant to supply electricity to the towns and railway on the western line. The station will ultimately be connected up with Sydney.

PROPOSED POWER SCHEME FOR NEW ZEALAND.—The Provisional Electrification Committee, Dunedin, has adopted a report for a power scheme for the Otugo district presented by A. P. Aldridge, engineer of the committee. Electricity will be supplied from Port Chalmers to Palmerston. The cost of the entire project is estimated at about £150,000.

## New Apparatus and Publications

UNDERFEED STOKER.—"Built on Advanced Engineering Principles" is the title of a bulletin distributed by the Detroit Stoker Company, General Motors Building, Detroit, in which it describes and illustrates the "Detroit" level-fuel-bed, multiple-retort underfeed stoker.

LAMP-MAKING MACHINES. — Charles Eisler, 750-760 South Thirteenth Street, Newark, N. J., has developed the "Eisler" unit lamp-making machines. This unit is made in several styles, for regular vacuum lamps, miniature lamps and gas-filled lamps.

EVAPORATORS AND DISTILLERS.—The Bethlehem Shipbuilding Corporation, Ltd., Bethlehem, Pa., is distributing bulletin No. 15, covering the "Bethlehem-Weir" evaporators and distillers.

FLEXIBLE VARNISHED TUBING.—The Acme Wire Company, New Haven Conn., is distributing a leaflet describing the "Acme" flexible varnished tubing which it has added to its line of products.

SOOT BLOWER.—The Bayer Company, 4066 Park Avenue, St. Louis, Mo., is distributing a folder describing the "Bayer" blower.

SPLICING SLEEVES AND TWISTING TOOLS.—The High Tension Company, 120 Broadway, New York City, has issued bulletin No. 1-A, covering its high-tension, seamless-copper splicing sleeves and twisting tools.

WATCHMAKERS' LATHE MOTOR.—A combination watchmakers' lathe motor and polishing motor, furnished complete with foot controller, reverse switch, pulley and buffing and grinding attachment, has been brought out by the Fidelity Electric Company, Lancaster, Pa.

HEAVY-DUTY REELITE.—A device for paying out and automatically retrieving electric conductors for power and light which is adaptable for cranes, dredges, mining machinery, etc., has been developed by the Appleton Electric Company, 1701 Wellington Avenue, Chicago.

TUMBLER SWITCH. — A new shallow tumbler switch made in double-pole and four-way types has been placed on the market by the Hart & Hegeman Manufacturing Company, Hartford, Conn.

ELECTRIC FURNACE.—The Booth Electric Furnace Company, 411 North Wells Street, Chicago has placed on the market an electric melting furnace of the ladle type.

## New Incorporations

THE SHILOH LIGHT & POWER COMPANY, Statesville, N. C., has been incorporated with a capital stock of $10,000 by H. M. Morrison, G. W. Nash and S. G. Caugill.

THE BANCROFT LIGHT, HEAT & POWER COMPANY, Ltd., Bancroft, Ontario, Canada, has been incorporated with a capital stock of $1,000,000. Donald L. Cameron is director.

THE GLENIRON (PA.) POWER & TOOL COMPANY has been incorporated with a capital stock of $500,000 by R. F. Boop, John T. Church, Gleniron, and J. W. Shook, Bellefonte, Pa. The company proposes to operate an electric and gas plant.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

MARLBORO, N. H.—The Keene (N. H.) Gas & Electric Company will soon begin work on its proposed hydro-electric power plant, to cost about $300,000.

PORTSMOUTH, N. H.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until July 10, for three motor-generators and three sets of spare parts for the local navy yard. (Schedule 981.)

GARDNER, MASS.—The Gardner Electric Light Company has applied for permission to issue $176,750 in capital stock, part of the proceeds to be used for extensions.

## Middle Atlantic States

AMSTERDAM, N. Y.—The Adirondack Power & Light Company is planning to erect a three-phase, high-tension transmission line through the towns of North Greenbush, Stephantown, Nassau and Sand Lake, to connect with the lines of the New England Power Company. The cost is estimated at about $50,000.

BINGHAMTON, N. Y.—The Binghamton Light, Heat & Power Company has acquired property in the vicinity of its Noyes Island substation for proposed additions.

BROOKLYN, N. Y.—The Kings County Lighting Company will build a power house at 880 Sixty-fifth Street, to cost $50,000. Hugh Cuthrell is architect for the company.

BROOKLYN, N. Y.—An expenditure of more than $1,750,000 on new equipment and improvements has been authorized by the directors of the new Brooklyn-Manhattan Transit Corporation. Of this amount about $580,000 will be expended for cables and substations and the remainder for new cars.

BROOKLYN, N. Y.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until July 10, for storage-battery testing outfits and hydrometers (Schedule 1012), also for wire and cable, for use at the local navy yard (Schedule 1000).

NEW YORK, N. Y.—The New York Edison Company will build a service and storage building at 708-20 First Avenue, to cost about $2,000,000. Thomas E. Murray, 55 Duane Street, is engineer.

OSSINING, N. Y.—The I. Terwilliger & Sons Lumber Company plans to rebuild its power house and lumber mill, recently destroyed by fire, causing a loss of about $100,000.

STRATFORD, N. Y.—The Adirondack Power & Light Corporation, Amsterdam, has petitioned the Public Service Commission for approval of a franchise granted by the town of Stratford. The company contemplates an extensive development in Stratford and Oppenheim.

WATERTOWN, N. Y.—The Northern New York Utilities, Inc., has issued $2,212,200, in bonds, part of the proceeds to be used for a new generating plant and improvements.

BELLE MEAD, N. J.—The Belle Mead Electric Light & Power Company, recently organized with a capital of $125,000, plans to install a local system for commercial light and power service.

CARTERET, N. J.—Arrangements have been made by the Ichabod T. Williams & Sons Company, Eleventh Avenue and Twenty-fifth Street, New York, for the construction of its proposed local hardwood mills, including power house, to cost about $500,000.

MORRISTOWN, N. J.—The Jersey Central Power & Light Company has issued $1,156,000 in capital stock, part of the proceeds to be used for extensions and improvements.

RIDGEFIELD PARK, N. J. — Electric power equipment will be installed in the proposed ice-manufacturing plant to be erected by the Bergen Hygeia Ice Company on Tucker Street, to cost about $150,000.

VERONA, N. J.—Bids will be received by the Board of Freeholders, George C. Bergen, county purchasing agent, Court House, Newark, until July 10 for electrical work in connection with a power-house addition at the county sanitorium. Guilbert & Betelle, Chamber of Commerce Building, Newark, are architects.

COOPERSBURG, PA.—The Pennsylvania Power & Light Company, Allentown is negotiating for the purchase of the system of the Coopersburg Light, Heat & Power Company. A substation will be built and transmission lines extended to Coopersburg.

DELTA, PA.—The Edison Electric Light & Power Company, York, has acquired the properties of the Delta Electric Power Company and the Delta Water & Power Company. Extensions will be made in the systems, and the transmission lines extended to Castle Fin, about 20 miles.

PHILADELPHIA, PA.—Plans are being made by the trustees of the Franklin Institute, 15 South Seventh Street, for remodeling four buildings at Nineteenth and Race Streets for the establishment of new laboratories, consisting of about twenty rooms, equipped with electrical and mechanical precision apparatus for complete experimental research. The work will be done under the direction of the Henry W. Bartol Research Foundation of the institute.

PITTSBURGH, PA. — Bids will be received by the Superintendent of Buildings, Board of Education, Fulton Building, until July 12 for electric work in the proposed Chatham school, Waldorf and Bonvue Streets.

PITTSBURGH, PA.—The managers of the Phipps Power Building, Duquesne Way and Cecil Place, have engaged Dwight P. Robinson & Company, Inc., 125 East Forty-sixth Street, New York, engineer, to prepare plans for an addition to the building, to cost about $250,000.

READING, PA.—The Metropolitan Edison Company is organizing three subsidiaries, to be known as the South Londonderry-Lebanon Electric Company, West Cornwall-Lebanon Electric Company and the Cornwall-Lebanan Electric Company, to erect transmission lines through the respective territories. The Metropolitan company has called a special meeting for Aug. 14 to arrange an increase in capital from

90,000 to 300,000 shares of stock, part of the proceeds to be used for expansion.

RED HILL, PA.—The Red Hill Power & Light Company has been organized to construct a transmission system in this district. Thomas J. Perkins, Allentown, Pa., represents the company.

BALTIMORE, MD.—Bids will be received by the Board of Awards, care of F. A. Dolfield, City Register, until July 5 for about 100,000 ft. of single vitrified-clay conduit for the city electrical commission. Charles F. Good is chief engineer of the commission.

HUNTINGTON, W. VA.—The Consolidated Power & Light Company has issued $1,500,000 in capital stock, the proceeds to be used for expansion, including the completion of the 20,000-hp. power plant now being erected at Kenova and transmission-line extensions.

SUTTON, W. VA. — The Monongahela-West Penn Public Service Company contemplates extensions in its transmission lines, with substation improvements in plants recently acquired at Parsons, Elkins and Sutton.

KILMARNOOK, VA. — The Kilmarnook Light & Power Company, recently organized, plans to build a substation, with distribution system, for commercial light and power service in sections of Lancaster and Northumberland Counties. W. L. Masen is president.

WASHINGTON, D. C.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until July 17 for automatic telephone equipment and air-conditioning apparatus.

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until Aug. 1 for Signal Corps cable, totaling about 75,000 miles of different types, gutta-percha-insulated. Alternate bids will be received for rubber insulated. (Proposal 15085—1 CP.)

WASHINGTON D. C.—Bids will be received by the Bureau of Yards and Docks, Navy Deparment, Washington, D. C., until July 18 for extension to battery storage and overhaul at Pearl Harbor, Hawaii.

## North Central States

DETROIT, MICH.—The City Council has voted to proceed with the construction of the four-unit lighting plant at the foot of Morrell Street, to cost about $12,000,000.

IRONWOOD, MICH.—The Ford Motor Company, Highland Park, has applied to the Federal Power Commission for permission to build a hydro-electric plant on the Menominee River, to cost about $500,000, for service at its Northern Michigan works.

LANSING, MICH.—The Durant Motor Company is planning to double the capacity of the power plant at its local works.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, until July 6 for mechanical stokers for the division of light and power.

BOWLING GREEN, KY.—The Kentucky-Tennessee Public Service Company is completing plans for tying in all properties of the Kentucky Public Service Company and the Kentucky-Tennessee Light & Power Company located in southern Kentucky and northern Tennessee. These plans will involve the erection of approximately 95 miles of high-tension lines. The company has franchises in all counties connecting its different stations. O. E. Wessell is assistant general manager of the Kentucky Public Service Company.

HOPKINSVILLE, KY.—The Kentucky-Tennessee Light & Power Company Bowling Green, has started construction on a 3,000-kw. addition to its local power plant, to cost about $300,000. The plans include a new turbine, changes to boilers and spray pond. Provision is being made to increase the capacity of the station to 9,000 kw. O. E. Wessel is assistant general manager.

LOUISVILLE, KY.—The erection of a 33,000-volt transmission line from Richmond to Winchester (20 miles) is under consideration by the Kentucky Utilities Company, Louisville.

MURRAY, KY.—The Council contemplates the purchase of a 200-hp. oil engine and auxiliary equipment for the municipal electric light plant. M. T. Morris is in charge.

INDIANAPOLIS, IND.—The directors of the Robert W. Long Hospital and the James Whitcomb Riley Hospital for Children have received permission from the Public Service Commission to install an electric power plant for the joint use of the institutions. An appropriation of $250,000 is available.

LINTON, IND.—The High Grade Coal Company, Terre Haute, contemplates the rebuilding the power house at its local properties, recently destroyed by fire.

SOUTH BEND, IND.—The Twin Branch Power Company, a subsidiary of the American Gas & Electric Company, New York, is preparing plans for the construction of a six-unit generating plant on the St. Joseph River, each unit to have a capacity of 35,000 kw., to cost about $10,000,000, with transmission system.

ELLIS JUNCTION, WIS.—The Wisconsin Public Service Company, 559 Marshall Street, Milwaukee, is asking for bids for outdoor substation, switchboard, two 200-ft. penstocks, six Tainter gates, two sluice-gates. Mead & Seastono, Journal Building, Madison, are engineers.

FLORENCE, WIS.—Extensive improvements are contemplated by the Peninsular Power Company, Madison, to its local plant, involving an expenditure of about $250,000. The plans call for the erection of a building adjacent to its present plant to be equipped with a Diesel-oil-engine-driven unit.

LA CROSS, WIS.—Bids will be received by the La Crosse Lutheran Hospital Association for building a nurses' home and for remodeling power house, to cost about $150,000. O. A. Merman, Linker Building, is architect.

STEVENS POINT, WIS.—Steps have been taken by property owners on Clark Street for the installation of an ornamental lighting system.

LITCHFIELD, MINN.—Extensions to the municipal electric light and power plant to cost about $75,000 are under consideration. L. P. Wolff, Guardian Life Building, St. Paul, and E. D. Jackson, Endicott Building, St. Paul, are engineers.

ANAMOSA, IOWA.—The Iowa Electric Company is erecting a high-tension transmission line from Anamosa to Olin, which will be extended from Olin to Oxford Junction, to replace the line which is now in operation.

IDA GROVE, IOWA.—The Ida Grove Electric Company contemplates improvements to its system, to cost about $25,000.

CAMERON, MO.—The Council has engaged E. E. Harper, 3031 Park Avenue, Kansas City, engineer to prepare plans for improvements to the municipal electric plant, to cost $85,000, for which bonds have been voted.

ST. LOUIS, MO.—The Missouri-Pacific Railroad Company has plans under way for the construction of a power house on Choteau Avenue, to cost about $55,000. A similar plant will also be built in connection with a number of mechanical buildings on Van Buren Street to cost $100,000.

MULVANE, KAN.—Plans are being prepared for extensions and improvements to the municipal electric plant.

## Southern States

RALEIGH, N. C.—The Carolina Power & Light Company has issued $2,500,000 in bonds, part of the proceeds to be used for extensions, including a new power plant with initial capacity of 15,000 kw. and a transmission system.

RUTHERFORDTON, N. C.—The Taylor Lumber Company contemplates the construction of a power house at its proposed local mill.

WHITAKERS, N. C.—Bids will be received by the Mayor and Board of Aldermen until July 11 for furnishing material, equipment, etc., for the construction of a three-phase, 6,600-volt wood-pole transmission line between Whitakers and Endfield, a distance of about 6 miles. W. T. Hearne is superintendent of lighting department.

WILMINGTON, N. C.—Plans for the proposed mill to be erected by the Wilmington Wood Products Company include a power house. The cost of the project is estimated at $60,000. L. L. Merritt, Wilmington, is engineer.

CHARLESTON, S. C. — The Southern States Lumber Company, recently incorporated, is reported to be planning the construction of a new mill and power house, to cost about $100,000. B. O. Elting is president.

TALLAPOOSA, GA. — The Tallapoosa River Power & Textile Company, recently organized, is planning to build a hydro-electric plant to cost about $100,000. A transmission system will be built to supply service in this district.

MIAMI, FLA.—The Ocean-River Corporation, First National Bank Building, will build an electric power plant at its properties. Bids will be called at once.

TAMPA, FLA.—The Tampa Bay Fertilizer Company, recently organized, plans to build a power house in connection with a new local mill, to cost about $250,000. S. W. Allen is president.

WINTER HAVEN, FLA. — The Tampa Electric Company plans extensions and improvements to the system of the Winter Haven Light & Power Company, a subsidiary.

MADISONVILLE, TENN.—Bids will be received by the City Council until July 3 for pumping and other equipment, including four centrifugal pumping units, two electric motors with automatic control, two gasoline engines and auxiliary equipment for the municipal waterworks. The Ambler Engineering Company, Travelers Building, Richmond, Va., is engineer.

MEMPHIS, TENN.—The Memphis Power & Light Company is planning to increase the output of its generating plant by 15,000 kw.

NASHVILLE, TENN. — The Du Pont Fibre Silk Company, Buffalo, N. Y., plans to construct a power house in connection with its proposed local mill, to cost about $500,000.

HOLLYWOOD, ALA.—The installation of electrically driven pumping machinery in the municipal waterworks is under consideration. Prices are also being asked on oil-engine equipment. J. C. Wall is engineer.

TALLASSEE, ALA.—The Alabama Power Company, Birmingham, has been granted permission to purchase the dam and power house of the Vernon-Woodbury cotton mills on the Tallapoosa River, near Tallassee. The Alabama company contemplates increasing the output of the plant by 8,000 hp., and plans are also under way to install an additional unit of 15,000 hp. Eventually a plant of 60,000 hp. will be built.

GARNER, ARK.—The Kelly Lumber Company plans to construct a power house at its proposed new mill to cost about $90,000.

RUDY, ARK.—The Fort Smith Fertilizer Company, Fort Smith, Ark., plans to construct a power house at its proposed local plant, to cost about $75,000.

GIBSLAND, LA.—The City Council has taken over the electric plant of the Gibsland Light & Power Company, to be owned and operated by the municipality.

MONROE, LA.—The Brown Paper Mill Company, Inc., Orange, Tex., plans to build a power plant in connection with its proposed local paper mill, to cost about $1,000,000.

WELCH, OKLA.—The Commissioners of Craig County have granted the Empire Electric Company, Joplin, Mo., a franchise to erect a transmission line from the county line through Welch to Hudson, a distance of about 12 miles.

DENTON, TEX.—Plans are under way for the construction of an addition to the State College of Industrial Arts. R. F. Taylor, Western Indemnity Building, Dallas, is engineer.

FORT WORTH, TEX.—Bids will be received by the Board of Commissioners until July 3 for a motor-driven centrifugal pump of 12,000,000 gal. capacity per twenty-four hours, under a head of 270 ft. Alternate bids will be received for a Diesel-engine-driven pumping unit. Dudley L. Lewis is city engineer.

GIDDINGS, TEX.—The light and power plant of the Giddings Cotton Oil Company has been acquired by the Giddings Manufacturing Company. Extensions and improvements will be made, including the installation of additional equipment.

HOUSTON, TEX. — Plans have been adopted by the Houston Lighting & Power Company for extension and improvements to its system, to cost $4,492,000, as follows: New power station, $2,632,000; improvements to underground system in business district, $330,000; new substation, Houston Heights, $140,000; new substation, Washington and Fourth Streets, $19,000; improvements to Gable Street power station, $330,000; improvements to distribution lines, $300,000; short extensions, meters and transformers, $403,000; miscellaneous work, $308,000.

KINGSVILLE, TEX. — The Legislature has approved an appropriation of $330,000 for the construction of a power plant and administration building at the local South Texas Teachers' College. Plans have been approved also for improvements in the power plant at the West Texas Teachers' College, Canyon, including the installation of additional electric and steam equipment.

RISING STAR, TEX.—The Rising Star Light & Power Company contemplates a number of extensions and improvements. The company has increased its capital stock from $15,000 to $25,000.

SANGER, TEX.—At an election to be held by July 7 the proposal to issue $90,000 in bonds for the construction of waterworks, sewer system and an electric light and power plant will be submitted to the voters.

## Pacific and Mountain States

TUMWATER, WASH.—The Puget Sound Power & Light Company, Seattle has been granted a franchise for a transmission line from Tumwater to Tenino. Work will be placed under way at an early date.

BEND, ORE.—The L. E. Myers Company, 53 West Jackson Boulevard, Chicago, has acquired the plant and system of the Bend Water, Light & Power Company. Plans are under consideration for extensions and improvements.

KLAMATH FALLS, ORE.—The Secretary of the Interior has authorized the sale of the Keno and Ankeny canals in the Klamath irrigation project to the California-Oregon Power Company. The company proposes to develop the power, at a cost of $750,000 to supply electricity to lumber mills and other industrial enterprises in this vicinity.

PORTLAND, ORE.—Shafer, McLaughlin & Hillier, Inc., will install a power house at its proposed new lumber plant at the Columbia Boulevard and Vancouver Road.

PORTLAND, ORE.—Surveys are being made by the Pacific Power & Light Company, Portland, along the Deschutes River, in the vicinity of Ketchum station, covering a distance of 10 miles, on a proposed site for a hydro-electric power plant. The plans call for a development of about 40,000 hp., the cost of which will be between $2,000,000 and $3,000,000.

FRESNO, CAL.—The San Joaquin Light & Power Corporation has issued $2,500,000 in bonds, part of the proceeds to be used for extensions.

LOS ANGELES, CAL.—The County Supervisors plan to install an ornamental street-lighting system on Walnut and Palm Avenues, Spencer, Roane, 162d and San Pedro Streets.

LOS ANGELES, CAL.—The Pacific Electric Railway Company plans improvements to the San Bernardino line, to cost about $100,000. The wooden substations will be replaced by steel and concrete buildings, and the present 1,000-kw. motor generator set will be replaced with a 1,500-kw. automatic installation.

MADERA, CAL.—The Madera Irrigation District has applied to the State Water Commission for permission to construct a hydro-electric plant on the Fresno River, to cost about $2,000,000.

SAN FRANCISCO, CAL.—The Great Western Power Company of California plans to increase the output of its electric plants at Las Plumas and Caribou. A third unit will be installed at the Caribou, at a cost of about $1,000,000. Extensions will be made to the Las Plumas plant, to cost about the same amount.

## Canada

BANCROFT, ONT.—The Bancroft Light, Heat & Power Company, recently incorporated, contemplates the construction of two hydro-electric plants on the York branch of the Madawaska River. Donald L. Cameron is director.

CAMPBELLFORD, ONT. — Preparations are being made by the Hydro-Electric Power Commission of Ontario for a hydro-electric development, to cost about $250,000, at dam No. 8, near Campbellford. Plans, it is said, have been prepared for a similar plant, to be located nearer the town, to be known as No. 9.

ST. THOMAS, ONT.—The Hydro-Electric Power Commission of Ontario plans to erect 15 miles of transmission lines in the district adjoining St. Thomas, to cost about $50,000. F. A. Gaby is chief engineer.

TORONTO, ONT. — The Hydro-Electric Power Commission of Ontario is planning to connect Niagara with the Eugenia plant. The project includes increasing the output of the plant at Eugenia, constructing new pipe line, installing frequency changer, etc. The cost is estimated at $75,000.

UNITY, SASK.—Tenders will be received by J. M. Jenson, town clerk, Unity, until July 5 as follows: Tender A—For furnishing and erecting an internal combustion engine; tender B—for furnishing and installing a generator, exciter, switchboard and other apparatus; tender C—for construction of addition to power house. A. A. Murphy, Saskatoon, Sask., is consulting engineer.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued June 5, 1923)

1,458,105. RHEOSTAT; S. R. Hipple, Williamsport, Pa. App. filed Sept. 6, 1922. Granular resistance varied by pressure.

1,458,120. MAGNET AND DYNAMO-ELECTRIC MACHINE STRUCTURE; R. B. Williamson, Milwaukee, Wis. App. filed June 8, 1918. Framework for magnets on large generators.

1,458,121. DYNAMO-ELECTRIC MACHINE; A. J. Brown, Milwaukee, Wis. App. filed Aug. 29, 1918. Bearing construction for vertical hydro-electric generators.

(Issued June 12, 1923)

15,623 (reissue). EXCITING SYSTEM OF PHASE CONVERTERS; R. E. Hellmund, Swissvale, Pa. App. filed Aug. 7, 1916. Converting single-phase current to polyphase of railway locomotives.

1,458,124. BATTERY HANDLAMP; E. Alschuler, St. Louis, Mo. App. filed Jan. 4, 1919. Flashlight.

1,458,126. TRANSFORMER; R. V. Bingay, Pittsburgh, Pa. App. filed Oct. 1, 1920. Structure and tank for small oil-cooled transformers.

1,458,138. CLAMP FOR WELDING-MACHINE ATTACHMENTS; H. W. Krantz and J. Lukes, Cleveland, Ohio. App. filed May 24, 1920. For holding ends of wheel rims during welding operation.

1,458,139. COMBINED IGNITION AND LIGHTING GENERATOR; L. J. Le Pontois, Lakewood, Ohio. App. filed Aug. 23, 1917.

1,458,153. VACUUM-TUBE BASE AND RECEPTACLE; F. H. Shaw, East Orange, N. J. App. filed Aug. 20, 1919.

1,458,165. SYSTEM OF ELECTRICAL CONTROL; W. W. Coblentz, Washington, D. C. App. filed Sept. 22, 1920. Remote control of apparatus by radio.

1,458,180. ADVERTISING DEVICE; J. H. Hammond, Jr., Gloucester, Mass. App. filed June 1, 1916. Automatic light-flashing sign.

1,458,182. ELECTROTHERMAL BATH CABINET; M. F. Hasemeier, Woodward, Okla. App. filed Jan. 25, 1922. Patient treated by heat and light rays produced by electricity.

1,458,193. MULTIPLE BALANCING ARRANGEMENT FOR MULTIPLEX TRANSMISSION; H. S. Osborne Montclair, N. J. App. filed Sept. 13, 1919.

1,458,225. MULTIPLE BALANCING ARRANGEMENT FOR MULTIPLEX TRANSMISSION; L. Espenschied, Hollis, N. Y. App. filed Aug. 29, 1919. High-frequency carrier currents used for transmission of signals.

1,458,247. WIRE CLAMP; J. F. Schleper, Amsterdam, Netherlands. App. filed Feb. 20, 1920. Connector especially adapted to conduits.

1,458,273 and 1,458,274. WELDING PROCESS; M. S. Clawson, Upper Montclair, N. J. App. filed April 23, 1920. Resistance welding method.

1,458,291. APPARATUS FOR DEHYDRATING PETROLEUM OILS; F. W. Harris, Los Angeles, Cal. App. filed June 28, 1921. Magnetic displacement of current carrying path through emulsion.

1,458,307. DRY ELECTRIC BATTERY; L. Levaillant, Zurich, Switzerland. App. filed Jan. 12, 1923. Built up of flat cells.

1,458,329. HAND BAG; C. S. Elfelt, Los Angeles, Cal. App. filed May 16, 1921. Electrically lighted.

1,458,336. ILLUMINATED AUTOMOBILE SIGNAL; S. G. Grandjean and J. J. Darcey, Braithwaite, La. App. filed July 2, 1921. Rear direction signal.

1,458,338. HEIGHT INDICATOR FOR LIQUIDS; R. Grimshaw and C. J. Weis, Clyde, Ohio. App. filed Oct. 9, 1919. Operating arm working over series of contacts gives direct indication of height of liquid.

1,458,377. STORAGE BATTERY; E. Anderson, Dayton, Ohio. App. filed Nov. 18, 1919. Separator of porous vitrified ceramic product.

1,458,418. SAFETY DEVICE AND SWITCH; C. L. Johnston, Oakland, and C. M. F. Friden, Piedmont, Cal. App. filed March 6, 1922. Cut-out switch for handle of flatiron.

1,458,430. MELTING OR SOLDERING POT; E. Millner, St. Louis, Mo. App. filed Sept. 29, 1920. Heating element entirely surrounded by material to be melted.

1,458,466. ANTENNA SELECTOR SWITCH; A. Crossley, Washington, D. C. App. filed July 7, 1919. To connect various combinations of underground, elevated or loop antennas to receiving apparatus.

1,458,500 and 1,458,501. RHEOSTAT; F. A. Rojas, New York, N. Y. App. filed Nov. 18, 1921. Compressible resistance type for lamp sockets.

1,458,525. PROCESS FOR FIXATION OF ATMOSPHERIC NITROGEN; F. Daniels, East Falls Church, Va. App. filed May 12, 1919. By employing streaming electric discharge.

1,458,533. GROUND CLAMP; G. Lipschutz, Philadelphia, Pa. App. filed April 26, 1921. Thin strap drawn through holes makes connection.

1,458,545. IMPULSE TRANSMITTER; W. T. Powell, Rochester, N. Y. App. filed June 13, 1919. For automatic telephone systems.

1,458,555. TELEPHONE SYSTEM; F. M. Slough, Rochester, N. Y. App. filed Oct. 14, 1914. Associate multiple is employed.

1,458,601. ELECTRODYNAMIC TRANSMISSION SYSTEM FOR VEHICLES; H. L. Tanner, Brooklyn, N. Y. App. filed Feb. 5, 1917. Generator-motor drive for low speeds and electromagnetic drag for higher speeds.

1,458,611. LIGHTNING ARRESTER; L. S. Brach, East Orange, N. J. App. filed May 17, 1921. Low-voltage vacuum-type arrester.

1,458,613. PLANER AND SYSTEM OF MOTOR CONTROL THEREFOR; H. L. Blood, Plainfield, N. J. App. filed Jan. 31, 1920. Main starting switches prevented from closing except under proper conditions.

1,458,620. FLUID-TIGHT APPARATUS; G. Fussner, Menominee, Mich. App. filed Oct. 12, 1920. Waterproof electric bell.

1,458,634. TRANSFORMER COOLER AND ELECTRIC HEATER; A. H. Waage, Rosedale, N. Y. App. filed Nov. 10, 1921. Windings made of tubes through which cooling water is forced.

1,458,647. ELECTRIC CLOCK; E. Fowler, Baltimore, Md. App. filed July 7, 1919. Secondary clocks controlled by master.

1,458,665. SIGNAL LANTERN; G. W. Stewart, Chicago, Ill. App. filed March 29, 1922. For railway service.

1,458,682. SHORT-CIRCUITING DEVICE; H. L. Brump, Dayton, Ohio. App. filed April 4, 1922. For repulsion motors having series-motor characteristics.

1,458,692. CONDUCTOR ARRANGEMENT OF ELECTRIC TRACTION SYSTEM; C. E. Fairburn, London, England. App. filed Sept. 22, 1920. Combination of third-rail and overhead systems.

1,458,711. VEHICLE DIRECTION INDICATOR; F. Koppenhafer, Shinrock, Ohio. App. filed Nov. 1, 1920.

1,458,728. ELECTRIC APPLIANCE RECEIVING AND METER PROTECTING BOX OR CASING; J. Sachs, Hartford, Conn. App. filed April 2, 1918. Switchbox and adapter for bottom-connected meter.

1,458,749. SWITCH MECHANISM; F. S. Denison, Minneapolis, Minn. App. filed Dec. 2, 1920. Thermostatical control.

1,458,754. INSULATOR; W. T. Goddard, Victor, N. Y. App. filed Dec. 8, 1917. Space between successive petticoats.

1,458,755. INSULATOR; W. T. Goddard, Victor, N. Y. App. filed April 11, 1918. Method of connecting units of high-tension insulators together.

1,458,756. STRAIN INSULATOR; W. T. Goddard, Hamilton, Ontario, Can. App. filed Oct. 25, 1919. Flexible connection between porcelain and metal.

1,458,757. PILLAR-POST STRUCTURE FOR BATTERIES; P. Goldsborough, Minneapolis, Minn. App. filed March 19, 1921. Special construction for automobile use.

1,458,763. ELECTRIC RADIATOR; C. A. Head, Royal Oak, Mich. App. filed June 26, 1922. For house heating.

1,458,803. INSULATED ELECTRIC WIRE; H. B. Burley and H. E. Rooney, Brookline, Mass. App. filed Feb. 6, 1922. For high-voltage transmission.

1,458,806. ELECTRIC GENERATING GROUP; E. L. P. Colardeau, Paris, France. App. filed Oct. 22, 1918. Operation of railway motors.

1,458,819. VEHICLE SIGNAL; J. S. Graham, U. S. Navy. App. filed July 1, 1921. Rear direction signal.

1,458,901. BATTERY TERMINAL; A. E. Buchenberg, Toledo, Ohio. App. filed April 4, 1918.
